THE ARCHITECT.

A JOURNAL OF ART, CIVIL ENGINEERING, AND BUILDING

THE WEEK.

THE Winter Exhibition of Old Masters at the Royal Academy is again devoted to paintings and drawings. It is remarkable that the experiment of 1888, when Renaissance work in metal and marble was introduced, has not been tried this year. It ought also to be possible to obtain examples of English sculpture. Some variation is desirable, for the exhibitions will soon be considered as monotonous. The gallery in Glasgow has been drawn upon this year, and the compliment will cause the citizens to appreciate their property, and to hasten the construction of a gallery where their pictures will be visible. One of the examples is by GIORGIONE, another by REMBRANDT, a third is by HUGO VAN DER GOES, and there is also a painting by MABUSE. From the Wallace Collection several pictures have been lent, and as in late years there are works by Spanish painters. ROMNEY is the strongest representative of the English School in the exhibition. There are also portraits by BEECHEY, ZOFFANY, HONE, and HOPPNER. TURNER'S *Vintage of Macon* was a noble work. In the water-colour room are some drawings by BLAKE, but they are not in his best manner. Taken as a whole, the exhibition is not likely to be popular on account of its attractiveness.

It is understood that the Government have decided to postpone the carrying out of Mr. ASTON WEBB'S plans for the completion of the South Kensington Museum. Preparations had been made in order that no objects in the museum should suffer from the building works, and that the workmen might not be restricted for space. But all that labour has been in vain. It is unfortunate that Mr. SHAW-LEFEVRE should always be placed in a false position while in office. He is permitted to assume the position of a statesman who believes with BURKE that to expend money on public buildings is always an advantage for a country. But as yet his name is not associated with any great works. In the case of South Kensington we consider it would have served his reputation if he displayed more energy. The project was no doubt made definite by the late Government, but it was a legacy from preceding Governments, and in fact statesmen of all parties are responsible for the delays. That the museum should be allowed to remain so long in an incomplete condition is not creditable to the country.

THE Secretary of the Society for the Preservation of Ancient Buildings does not appear to be able to perceive that when his committee blunders, the best course is to be silent. By posing as infallible, he makes the Society ridiculous. The statues of St. Mary's, Oxford, he wished to preserve, as if they were as valuable as the figures at Wells, are modern. He has attempted to get over his error by laying down propositions which are untenable. Mr. JACKSON found little difficulty in replying to the statements of Mr. TURNER, which we have printed on account of their amusing character. He now proposes two alternatives, writes Mr. JACKSON:—"1. To remove the statues, and leave their places untenanted. This certainly would not take any-

body in, but, on the other hand, it would spoil the steeple. The statues are as much a part of the design as the pinnacles. They are necessary to its outline. They give meaning to the niches and life to the composition. What right have we to leave the design imperfect and mar the beauty of the steeple in order that careless antiquaries may not go wrong in their dates? Surely pedantry can go no further. 2. 'To carve statues which being frankly modern can never be mistaken for the productions of another century than our own.' But what does Mr. TURNER mean by 'frankly modern'? The builders of St. Mary's steeple in the time of EDWARD I. and EDWARD II. robed the saints, kings, archbishops and bishops whose figures fill the niches in the costume of the fourteenth century. This was frankly modern, and had they done otherwise they would not have been the men they were. But now that we have to renew the figures, are we to dress them in the costume of our own day, the Saxon prelates in lawn sleeves and rochet, and EDWARD II. in the coronation robes of WILLIAM IV.? This would be doing exactly what was done by the builders of the steeple, and would certainly be 'frankly modern,' but I doubt whether Mr. THACKERAY TURNER would be pleased with the result." The Society has done good work, but there is no reason why the committee should on that account be authorised to express rash judgments, or to confound modern with ancient work.

It is difficult to believe, when looking at the Zuyder Zee as it now appears, that the great expanse of water was unknown prior to 1282, when there was an extraordinary inundation. The Zee is a busy place, and would appear to be invaluable to Amsterdam. But however much they may care for ships and trade, the Dutch people have never ceased to grieve over the hundreds of thousands of acres which were submerged. The success which has crowned attempts to convert sea into land in many parts of Holland has prompted many engineers to think over schemes for the reclamation of at least a part of the Zuyder Zee. In 1886 a society was formed with the object of preparing for the work. It has required nearly six years for the preliminary inquiries. At length a scheme has been prepared. It is proposed to construct a dyke at the northern and narrow part of the gulf, about sixty miles from Amsterdam. It will run from the island of Wieringen to the province of Friesland. The chief obstacle which has retarded the reclamation has been a dread of interference with the trade of Amsterdam. The completion of the great Northern Canal has made the city to some extent independent of the Zee. It is, however, intended to retain a lake or small sea out of the waters, which will be united by means of canals with the city and other towns. It is assumed that if the operations are successful at least 570,000 English acres of land, or about ninety square miles, will be recovered, and the greater part will be suitable for agriculture. The outlay may be assumed at twenty millions sterling, and the works will require thirty years before they are accomplished. It is understood that the Government will approve of the undertaking.

THE TRIUMPH OF LOVE. By J. B. Hüet.

J. B. HUET.*

THE largest monograph and the one with the most abundant illustrations that has appeared in the series "Les Artistes Célèbres" is devoted to JEAN-BAPTISTE HÜET and his three sons. The book is a sort of act of justice towards a designer who is entitled to a place among the artists that were famous. Many of our readers probably have never heard of HÜET, and ignorance is excusable, for the only man of the name who is introduced in most French biographical dictionaries was a bishop. JEAN-BAPTISTE HÜET was not only one of the greatest of draughtsmen with animal subjects, but he was one of the most imaginative and graceful designers of the eighteenth century. As an etcher of certain subjects, he

have to notice, came into this world, in the memorable year 1745. We have always imagined that the tenants of the Louvre in those days were a peculiar species of Bohemians. They took airs on themselves as became Royal officials, and yet they were the most dependent of mortals. Their income was precarious, for it appeared to come from the balance left after paying for various luxuries of the Court. If so, JEAN-BAPTISTE profited by the examples he saw around him in his youth, for he endeavoured to be thrifty, industrious and respectable. As he was brought up amidst artists, and was a sharp lad, it is difficult to determine when he commenced his studies; probably he was obliged to become useful to his father or some other painter in the Louvre as soon as he could handle a pencil. But

A DEDICATION PAGE. By J. B. Hüet.

has not been surpassed for simplicity, vigour and completeness. In fact, M. GABILLOT is right when he asserts that HÜET was "un artiste qui eut en lui l'étoffe de plusieurs artistes." As became a man of his class, HÜET spent his days in constant work, and his biography is therefore not marked by startling events.

It was one of the distinctions of JEAN-BAPTISTE that he was borne in the Louvre. When Royalty preferred other palaces, some of the buildings of the Louvre were assigned to artists and decorators, who were occupied as auxiliaries to the pride, pomp and circumstance of French kings. As NICOLAS HÜET was attached to the Royal furniture department as a herald painter (it was supposed he was an architect), he obtained a residence in the Louvre, and it was there his only son, whose career we

the artist who appears to have had the earliest influence on him was an outsider, a M. DEGOMMER, whose name, we apprehend, would not be of much power in CHRISTIE'S rooms. He painted animal subjects, some of which were engraved. Then he was with J. LE PRINCE, to whom he dedicated a volume of etchings, and afterwards he came under the influence of BOUCHER. There are designs by him which would easily be taken for BOUCHER'S work. We can realise that so promising a young fellow was coveted by many established painters as a disciple. His future seemed destined to be successful, and in those days, as now, the fame of French artists was a triumph for all who aided in their instruction. That HÜET had friends among the painters as well as at Court is evident when we learn that he was elected to the Academy when he was in his twenty-fourth year. He was also assigned a residence in the Louvre, and he remained there until the end of the century, when a new régime was in power.

* *Les Artistes Célèbres: Les Hüet.* Par C. Gabillo. (Paris: Allison & Co.)

In 1769, the year of his election, HÜET's pictures in the Salon exhibition were noticed by DIDEROT. The critic considered the painting was stronger than the modelling, and in consequence there was a want of harmony. Another critic, BOULMIERS, who apparently was acquainted with animals, declared there was no such discord, and he referred to HÜET's studies as being as beautiful as those by BERGHEM. At the next exhibition, two years afterwards, DIDEROT was more disposed to recognise the value of the young painter. He said that HÜET had not dethroned either DESPORTES or OUDRY, but he admitted the talent and the industry of the new-comer. His drawings of animals were pointed to as "assez bonnes." Apparently the critic, who was one of the pioneers of realism in literature, was, while in the Salon, rather disposed to have reverence for the ideals. Or was it that he was without opportunities to study wild animals, and felt that he was out of place when he sat in judgment on HÜET? In spite

as examples for imitation, or to enjoy from their intrinsic interest.

HÜET would not be allowed to depart from one class of subjects as an oil-painter, but there was no restriction of that kind in respect of his minor works. He designed so many varieties of compositions he might have been an "artist to the trade." HÜET could produce figures as fleshly as BOUCHER's or as ideal as PRUDHON's. Landscapes, flowers, birds, conventionalised ornament came from his hand in an abundance that is surprising. What is no less remarkable is that the treatment was Protean. As a rule, a painter's manner can be traced in his slightest sketches. But HÜET appeared to assume the style of a different artist for each variety of production. In the woodcuts this versatility is suggested, but of course it becomes more conspicuous when, as in M. GABILLOT's biography, there are nearly two hundred examples to consider. Nor was he above aiding manufacturers. M. CHARLES BLANC describes

A STUDY. By J. B. Hüet.

of all that was said against his paintings, HÜET by 1773 had gained sufficient success to make an engraving from one of his works a profitable speculation, and one of his *Laitière* was in the Salon of that year. Six years afterwards HÜET attempted a more academical subject, *Hercules and Omphale*, on a large scale, but it was not appreciated by critics or public, and if the artist were less of a favourite he must have succumbed to the ridicule it excited. He took the lesson in good part, and France did not lose the best animalier of that time.

The paintings in oil which he exhibited in the Salon were only a part of his productions. The representation of life gave him pleasure, and he was glad to employ any process that was facile. He produced drawings in chalk or in washes with marvellous expedition. Many people who could not afford to purchase his oil-paintings were glad to obtain his designs. The sketches were also useful for engravers to copy. In course of time he found that amateurs were glad to obtain his etched studies of animals

some of his designs for wall-papers: one series related to the history of PSYCHE, another to the legend of GENEVIÈVE of Brabant. He drew several friezes which were intended for the decoration of furniture. Quite recently pieces were sold at a high price which were described in the catalogue as *Sujets Hüet*, and he was one of the artists who were most successful in that classical style which seemed to be a consequence of the sacrifices that were offered by the first Revolutionists.

Between 1787 and 1800 it appears HÜET did not exhibit at one of the Salon exhibitions. When his work reappeared in 1800 it had to be subjected to criticism that was inspired by new canons. His animals and country scenes did not give satisfaction to visitors, who believed they were resuscitated Romans, and wished to have their heroic emotions excited by pictures. He tried to correspond with the desire to have all things French aggrandised by painting two sheep full size. He found his models in the Jardin des Plantes, and used an immense canvas to

represent them. The work has disappeared, but it was considered to be HÜET's masterpiece. It was offered to the Louvre by a son of the artist, but the Director was indifferent to its value, and rejected it. HÜET ceased to exhibit after 1802. The spoils which were derived from BUONAPARTE'S early campaigns required a large area to accommodate them, and the survivors of the artists who occupied parts of the Louvre were ejected to make room for paintings and statues. HÜET was compelled to leave a place where his

If JEAN-BAPTISTE HÜET had been more ambitious his name would be more familiar. His cleverness, however, tempted him into many fields of art. As he was thrown among artists from his childhood he could hardly fail to be an imitator of the ablest of them, and, his ability aiding, he became versatile. Several of the French artists of our time resemble him. They are not content with painting large pictures; circumstances often compel them to execute work of less importance, and which is not always acknow-

A FRIEZE. By J. B. Hüet.

A FRIEZE. By J. B. Hüet.

VIGNETTE TITLE. By J. B. Hüet.

life had been spent, but some annual allowance was made to him in compensation, for in the Catalogue of 1802 he is described as member of the former Academy of Painting and pensioner of the State. He was, moreover, able to purchase a property near Longjumeau, and he had also a suburban house at Sèvres. His productiveness was therefore advantageous to himself. But through some unrevealed cause he was obliged to dispose of parts of his estate in 1807—that is, four years before his death.

HÜET's name ought, therefore, to be held in respect by French artists, for he was a type of many among them. In all countries where art obtains attention he deserves remembrance for his cleverness. In England little could be known about HÜET, but henceforth—thanks to M. GABILLOT and the director of the series—we are in the position of Frenchmen, and can study numerous reproductions of the best works of a man who was not inferior to any of his contemporaries.

A FRIEZE. By J. B. Hüet.

FRENCH GOTHIC.*

THE history of Gothic architecture covers so wide a field as to be almost more than any one individual could attempt, and hence some writers wisely restrict themselves to a part of the history which relates to one country or one period. M. CORROYER, who is accepted by his countrymen as an authority on the subject, is therefore content to treat of Gothic as it was manifested in France. Mr. ARMSTRONG, who has edited the translation that Messrs. SEELEY has published, appears to consider that the author ought to have disregarded boundaries, and that he shows a want of "catholicity of grasp." In that opinion the *litterateur* is betrayed. Any one to whom architectural

know also that not one of the Mediæval builders called that style Gothic, or considered himself to be a Goth. But patriotism is allowed to overcome reason. Although, prior to the fourteenth century, Gothic was known in Germany as *opus francigenum*, it is granted that the claim of the Germans about their creation of the style is well founded, and in consequence of the prejudice buildings which a few years ago were accepted as so many glories for France are now as scorned as if they had been set up as trophies of an invasion. When feelings are so much disturbed it is an advantage not only for Frenchmen but for all admirers of Gothic art to have a book on Gothic by a writer about whose nationality there can be no doubt, and whose conclusions

STATUES, WEST PORCH, RHEIMS CATHEDRAL.

STATUE FROM DOORWAY, RHEIMS CATHEDRAL.

styles are more than topics for treatment in a book or journal will be always gratified to learn that a historian of architecture prescribes limits to himself and keeps to them. A *litterateur* finds it easier to take an extended view of the art from China to Peru than to describe the peculiarities of the buildings of a village; and this is seen by the number of histories of architecture for popular use which are to be found in most languages. But excellent as those compilations may be for all who need possess no more than an amateur's acquaintance with the art, they are not of much value for those who study because they are desirous to build. In no art is "viewiness" more pernicious than in architecture.

There is another advantage in M. CORROYER'S method of which Mr. ARMSTRONG could not be aware. During the last twenty years many French architects have been endeavouring to prove the importance of JULIET'S question to herself, "What's in a name?" They know that the progress of the style in which the Pointed arch is an element is more easily traced from southern to northern districts in France than in the reverse direction. They

are drawn from a thorough knowledge of French buildings. The relation between English and French Gothic is so close that whatever affects one must affect the other, and doubts about the origin of the style can no more be ignored in London than in Paris. Hence, it is that a writer like M. CORROYER becomes more generally useful when he adopts "a thoroughly French standpoint" than if he tried to look at Gothic buildings from a balloon in mid-air, where there were no national questions to disturb him.

It is evident that M. CORROYER was aware of the strength of the new notion, for he commences his book with a statement which is really a remonstrance with his brother architects, who are disposed to undervalue Gothic because of its supposed German origin. It is so important as coming from him that we think it right to print it:—

The term Gothic as applied to the architectural period dating from the middle of the twelfth to the end of the fifteenth century is purely conventional. The expression is clearly misleading, as indicating the architecture of the Goths or Visigoths; for these tribes were vanquished by Clovis in the sixth century, and left no monumental trace of their invasion. Hence their influence upon art was *nil*. The term is radically false, both from the historical and the archaeological point of view, and originates in an error which demands the strenuous opposition due to persistent fallacies. By a strange irony of fate the term *Gothic*, used in the last century merely as the opprobrious synonym of barbaric, has been specialised within the last sixty years in

* *Gothic Architecture.* By Edouard Corroyer, Architect to the French Government, and Inspector of Diocesan Edifices. Edited by Walter Armstrong. (London: Seeley & Co., Limited.)

connection with that polished epoch of the Middle Ages which sheds most lustre upon our national art. And this in spite of its Germanic origin.

Romanesque architecture, or to be exact, that architecture which by virtue of the archæologic convention of 1825 we agree to label Romanesque, undoubtedly borrowed its essential elements from the Romans and Byzantines, modifying and perfecting them by the genius of Western Europe; but the architectural period which began in the middle of the twelfth century, and is so unjustly dubbed Gothic, was of purely French birth; its cradle was the nucleus of modern France. Aquitaine, Anjou and Maine were the provinces in which it first took root. The royal domain, and notably the Ile-de-France, witnessed its most marvellous developments, and it was from the very heart of France that its splendour radiated throughout Europe. But the tyranny of usage leaves us no choice as to the title of this volume. We are compelled to style it Gothic architecture, though we would gladly have registered our protest by naming it French Mediæval architecture.

When it is remembered that M. CORROYER was appealing for a renewal of interest in Gothic, the claims he makes for the style are only reasonable. But Mr. ARMSTRONG detects in the words the spirit of chauvinism. And then he goes on to inform M. CORROYER and the readers of the transla-

writers throughout the year in a form which involves no responsibility. Fortunately for all parties the Editor does his note-making gently; the first specimen of it is almost the last, and therefore we need no longer delay the consideration of M. CORROYER's book.

It is rare to find a volume of the size—that is, containing about four hundred pages, of which many are occupied with illustrations (two hundred and thirty-six in all)—which contains not only so much information, but such an exposition of principles. M. CORROYER never forgets that he is an architect, and that his business is to write for fellow-students, young and old, about their Mediæval predecessors. He does not stray into legends or emotional subjects; he is not satisfied with applying epithets to a building and calling it grand, glorious, refined, well-proportioned, &c.; his aim is to discover why it is worthy of being so qualified. What he says is always expressed plainly and in few words.

M. CORROYER divides his book into four parts, viz. Religious Architecture, Monastic Architecture, Military Architecture (including gates and bridges), and Civil Archi-

SCULPTURE, DOORWAY, NOTRE DAME, PARIS.

SCULPTURE OF ARCHIVOLT, NOTRE DAME, PARIS.

tion that "art activities in the Middle Ages were as instinctive and unconscious as speech; the forms of architecture were invented and elaborated much in the same way as language." We wonder, would Mr. ARMSTRONG also conclude that the types used for his note were set up unconsciously and instinctively by the compositors? Yet type-setting is more allied to speech than the setting of stones in a wall. But what are we to say to the setting of stones in vaulting? If Mr. ARMSTRONG will try to discover what a vault really is—it will not be an easy work for him—we have hopes that he will see the folly of his unconscious and instinctive theory. As regards his assumption of a resemblance between word-making and building, it reveals that he is no more of an expert in philology than in architecture. If we assume certain differences in the construction of the ear and of the lips of races of men, we can understand how bhu became phuo, baula, bau, be and build; but what physical or mental organisation compelled men to substitute ogival arches for semicircular arches? There is no use in blaming Mr. ARMSTRONG; he simply puts his name to statements which resemble those which come from other

texture. The majority of the examples are French, and rightly so; but there are also examples from Belgium, Italy, Germany and England. The author is not a believer in architectural compartments or periods; time flows continuously, and styles, like all things else, move with it; accordingly the only divisions introduced are those of centuries. Gothic, to M. CORROYER, appears as "the continuous logical development of the Romanesque movement, just as the latter in its time had been the outcome of the gradual adaptation of old traditions to new-born exigencies."

The importance attached to St. Front in the evolution of Gothic has been questioned. M. CORROYER continues to hold the old opinion, for he says that in the pendentives of that church the embryo of the groined vault is to be traced. The architects of the Ile-de-France developed the vault, and as a result the flying buttress became a necessity, then it became a snare. There is evil compensation as well as good, and the constructive science that was seen in making masonry in one form outside a building resist a different form within, led to a defiance of risks by setting, as it were, disproportionate masses to fight out problems in statics.

As RENAN says, the passion for lightness grew to be madness. On one of VILLARD DE HONNECOURT'S sketches he represents himself as competing with another architect in the production of novel and bizarre forms. In such struggles stability was jeopardised. The chances of defective materials and workmanship were disregarded. Science was expected to prevail over all forces, and yet, owing to the backward state of the mathematical sciences, it is not likely that the principles of the builders could be formulated with precision. It may appear to be heresy to say so, but there must have been much empiricism employed in the proportioning of the parts of the best Mediæval churches. M. CORROYER'S love of French buildings does not hinder him from expressing the truth about their defects; he is no idolater of weakness because it is old. The buildings are, he says, "monuments to the ingenuity of the architects, but no less are they beacons warning against the perils of a

STATUES, NORTH PORCH, CHARTRES CATHEDRAL.

rationalism—more apparent than real—which their authors carried to its extreme limits, casting to the winds all traditional principles, and consequently all authority." It is novel to find a writer with the courage to dwell on the defects of a style with which his name is identified. As a contrast, M. CORROYER points to the massive solidity of English building.

A consideration of construction alone would leave an inadequate idea of Mediæval churches. Catholicity seems to admit all moods, and to allow them scope for expression. There are dimly-lighted Romanesque buildings, which suggest that they were erected by men who were severe to themselves and to all around them. The development of Gothic was marked not only by more daring construction, but by an expression of more joyousness, as a characteristic of life and more tolerance. The clergy did not excommunicate sculptors when they were humourists in their work, or became satirical of ecclesiastical organisations. It was remarkable also that the sculptors were compelled, as it were, to keep pace with the builder. As M. CORROYER writes:—"The history of sculpture is that of architecture, for the diverse influences which marked their origin and modifications were common to both. Each reached its

apogee in the brilliant manifestations of the thirteenth century, and each followed the same path to decadence." A question naturally arises whether it was meet, just and reasonable that the two arts should have a common fate. As the architect was the controller of all the subsidiary arts, he was able to compel any one of them to a course that must end in decay. At first the sculptors employed could only carve rude figures, but as time went on there was improvement. Sculpture and painting can travel faster towards perfection than architecture, but the Mediæval architects took care to impede that swiftness; the arts were forced to keep abreast, or rather architecture insisted on going ahead. But when the mother of the arts stumbled and fell, it seemed an excess of loyalty to expect that the subsidiaries must cast themselves to earth in order that she might not be abashed. Take the figures of the west porch of Rheims. We suppose every one will agree with M. CORROYER that they show Roman influence, or a direct imitation of Roman work. There is apparent in them no element of decay arising from the overgrowth of a quality. When French sculptors were able to execute such admirable figures, it was reasonable to expect successors of still more competence. We might suppose, however, that the figures at Rheims were considered to be too sculptural, for during the Gothic period there was no effort to surpass them. Figures like those to be seen at Chartres were probably considered to be far more suitable from their rigidity. The Rheims sculptors accepted nature as a standard, and the graceful attitudes of the figures, with the flowing lines of the drapery, reveal a search after beauty which could only be possible in cases where liberty was allowed. The sculptors were not afraid to provoke a contrast between their lines and those of the building. At Chartres there is limitation. The figures are stony, as if they were men and women metamorphosed into piers. The draperies are cut out on economical principles. The sculptors went beyond nature, and imagined a race of people in whom there was no longer guile. In the ornament from Notre Dame, Paris, as in much of the sculpture in that cathedral, we see efforts to be creative; but the hybrid beings, beyond their novelty, have no qualities that would not be secured by fidelity to nature. The peculiarities may, however, be attributed to foreign influences which controlled French sculptors. M. CORROYER describes some of them:—

The influence of Roman art upon French Mediæval sculpture is unquestionable. Its course may be traced through the relations existing between North and South long before the Crusades, principally by means of the great religious communities, and even more manifestly in the countless monuments raised in Gaul on Roman models, or in those constructed by Gallo-Romans for several centuries. Many of these survived the incursions of the barbarians. The origin of ornamental sculpture is no less venerable. Superficially, it would seem to have drawn its inspiration mainly from the Romanesque epoch; but, according to modern *savants*, its source must be looked for in much more remote periods. Oriental art, imported into Scandinavia and there barbarised, was introduced into Ireland in the early centuries of our era. The Irish monks, whose power was very great, and who seem to have been the principal agents in the Renaissance of the days of Charlemagne, created or, at any rate, greatly influenced, Carolingian art by their manuscripts and miniatures. From Carolingian art that of the so-called Romanesque period was born, and this was in its turn the parent of the ornamental sculpture of the thirteenth century. In the admirably decorative character of this art we recognise the influence of an ancient tradition handed on from generation to generation, to be finally rejuvenated, invigorated, and transformed as to detail by a close study of nature, precisely as had happened in the allied development of statuary. The architects of the Ile de France, like those of Rheims, assimilated the principles of the new art with the supple skill which characterised them, such assimilation bearing rich fruit at Notre Dame de Paris in the sculptured figures of the west porch, and no less in their accessory ornaments. A most instructive comparative study is furnished by the north and south porches of Chartres Cathedral. Here we find in one building examples of sculpture inspired by the hieratic tradition of Byzantium and of those which had been transformed and naturalised by a return to antique ideals.

M. CORROYER has also a chapter on Mediæval painting, including stained-glass, which contains a summary of what is known on the subject. The second, third and fourth parts of the volume we shall notice in our next number, but we take this opportunity to recommend the book to our readers. M. CORROYER has very decided opinions, but they are founded on the widest and most exact knowledge of French buildings. English architects who have not forgotten their studies in France cannot fail, after perusing the pages, to be thankful for so much information.

JAPANESE STENCILS.*

THE Japanese have rendered us a service in England for which we cannot be too grateful. They delivered us from the plague of South Kensington ornament, which was not only ruining our manufactures but was driving designers to despair. As long as it was put forth

change in the system, and for that we must be grateful to the Japanese. One class of work has hitherto contrived to be conservative and to retain the old forms which once were orthodox—we mean stencils. Wherever there is artistic control it is seen in the simplest stencil border, which of course should show a special design. We are now referring to the stencils which are prepared

CHRYSANTHEMUMS.

under Government authority that all forms of decoration were incorrect in which there was any trace of imaginativeness, true artists could have no chance, and it is no wonder so many have turned to the painting of pictures. But the mechanical geometrising and diagrammising of the

for the use of builders and decorators, and are to be obtained at "artists' warehouses" and other shops where painters' materials are sold. The majority of the patterns are as geometric and lifeless as any inspector-general, inspector or examiner in the old days of Brompton

CHRYSANTHEMUMS AND BUTTERFLIES.

Department was not able to hold its own against the simplest strokes of the Japanese decorators. The humblest servant-girl could perceive the difference between the Eastern and Western systems when they were applied to the adornment of cotton and other dress fabrics. South

could desire. There is not much choice for a buyer, and whether he selects Classic or Gothic patterns he is sure to obtain stereotyped forms.

A stencil cutter who turned his thoughts to the work that is done in Japan would discover possibilities of

CARP AND WAVES.

Kensington was defeated ignominiously, but as the salaries continued to be paid as promptly as of yore the loss of reputation was accepted philosophically. There was a

usefulness which are unknown among us. As in all times it was necessary to turn out ornamented work quickly, the Japanese were too wise to neglect the use of stencils. Collectors will maintain that every inch of surface decoration on their examples of pottery, panels or textiles is hand-work, although from a comparison of "pairs" it is not difficult to discover where the artist worked over a ground that was stencilled. In fact, the uniformity of style which is common in the works of various districts could not be

* *The Book of Delightful and Strange Designs.* Being One Hundred Facsimile Illustrations of the Art of the Japanese Stencil Cutter, to which the Gentle Reader is introduced by one Andrew W. Tuer, F.S.A., who knows nothing at all about it. (London: The Leadenhall Press, Limited.)

kept up unless there were means available to suggest the character the decoration was to assume, and which were to insure that it would not assume another character. It will be said that the principles of their art are enough to inspire as well as to limit the efforts of the ornamentists; but the Japanese are shrewd, and they take care to secure themselves against losses through freakish efforts by various sorts of arrangements, of which stencilling of certain parts is one. With delicate lines laid down for him the artist can at once recognise where he can exercise his imagination and powers, and with what forms he is to be consistent.

The remarkable collection brought out by Mr. TUER of impressions from their 'stencil-plates' will demonstrate the

The cutting of the stencils is not a mechanical operation only, for the vigour of the lines in the design has to be preserved. Whether it would be possible for an English workman to attain so much dexterousness may be doubted, but it would be beyond the power of most of the existing stencil cutters. What is of as much importance at present is that the value of the Japanese examples as sources of inspiration should be accepted. The hundred plates which Mr. TUER has collected should open out new vistas of delightful and attainable subjects, which would give more pleasure to the designers and to the people who have to pay for stencilling than miles of such patterns as are now in use. In this class of work, as in others, the Japanese are not afraid

BAMBOOS.

elaborateness which the Japanese can obtain. Their fingers are strong and delicate; and as SALADIN was able by his dexterity to cut a piece of lace that was placed on his scimitar, it might be said that the Japanese could rival the lace-maker in cutting out the most delicate patterns from a sheet of paper or from several sheets placed together. The process employed is described by Mr. TUER:—

The artist-workman takes some half-dozen sheets of tough paper, made of mulberry fibre (*Broussonetia papyrifera*) prepared with the juice of persimmon and waterproofed with a hard drying oil. On the top he places the artist's design drawn with ink. The sheets firmly secured, he begins cutting with a long thin knife, which he pushes before him in the same way as a copperplate engraver at home uses the burin. Slowly and accurately the keen blade cuts through the little pile of paper, following the curves of the design. Where there are punctured holes or dots the knife is superseded by a fine punch, for if pins were used a burr would be formed and the design would not print clear and sharp. When the cutting-out is finished two of the sheets are damped so that they may expand, and, what is of equal importance, contract equally in drying. One is laid down flat and covered with adhesive material. The threads are then one by one put in position, the ends sticking on to the margins. The second stencil is accurately laid over the first by means of upright pins placed in the "register" holes already mentioned, the two paper plates are brought exactly together and the threads securely imprisoned. The joining of the two

to utilise an abundance of the forms that nature produces. Mr. AITCHISON, A.R.A., who is now, fortunately, accepted as a friend, philosopher and guide by the Science and Art Department, has told students "that the flora of the world is not confined to the lotus, the honeysuckle and the acanthus, and that there are thousands of beauties still to be culled from plants and flowers that now remain outside the domain of art." The Japanese artists would hardly agree with the latter part of the advice, for what plant or flower is there which they have seen and neglected to utilise? But Mr. AITCHISON's words have special significance, for every man who designs, makes, sells or uses a stencil in this country. In ornamentation that is so manifestly mechanical, and which cannot deceive anybody, surely it is not imperative that only the most severe forms should be employed. "The Book of Delightful and Strange Designs" thus merits the attention of all who are in any way engaged with decoration. The blocks which we give are reductions to one-third the scale of the plates, and therefore can hardly express all the vigour and fitness of the originals.

Mr. TUER has already enriched the public with many ingenious books. In this case he has again hit upon a subject that may well be called fascinating. To many it will

HARE AND WAVES.

plates enclosing the threads is so absolutely perfect that a strong glass fails to disclose any sign of overlapping or unevenness. That anyone but a Japanese could execute such difficult work as this is simply impossible. When the stencil cutter has got through his first pile he puts a stencilled impression on the top of the next as a guide, in lieu of the original drawing, which now has no independent existence, and he will continue cutting out the same design until he has a number sufficient for his purpose. From its nature, especially when the design is delicate and finely cut, a paper stencil-plate cannot last very long. Many of the examples in our collection have seen so much service that they cannot again be used.

be a new revelation of Japanese art, and the hundred examples which are given will afford a truer notion of the decorative power that is found in the Flowery Land than is obtainable from more costly works. For the "Book of Delight" would be considered cheap by students of art. There is an introduction which will horrify pedants by its pleasant style, and as it is translated into German and French, a lesson in languages is thrown in with the bargain

SOME RENAISSANCE TOWERS, AND THEIR ANCESTRY.

THE world is not quite so fond of originality as it fancies. It is always wishing to see and hear some new thing, and yet, to please it much, the thing must not be wholly new. This is true in all the arts, but in none more than in architecture. There, if anywhere, novelty, to be borne with, must show itself by degrees. It may come as a fresh idea, transforming, bit by bit, the whole system into which it has penetrated. This was what happened at the rise of the Gothic styles in the twelfth century. But it may also come as a fresh fashion, not so much altering the old as reclothing and disguising it; and this is rather what took place during the earlier and middle Renaissance. In either case, it is interesting to trace back the resulting types to their origins; and in doing so we may get useful hints for our own attempts at the original. We shall find that the types which have succeeded are usually the types that have been developed, and that an architecture without ancestry is likely to be an architecture without posterity.

The City churches, rebuilt after the Fire of London, belong, of course, to the later Renaissance. It is not so obvious with them as with analogous buildings a century older that they are only Gothic in disguise. Their detail, for the most part, is severely Classic, and it is mainly in the planning of the churches and in the general composition of the towers that we find traces of their true character. Let us begin with one of the most familiar—the tower of St. Magnus, London Bridge. Its lower stage, above the pediment from which it springs, is plain and square. The next storey is also square, but relieved by coupled pilasters on each face next the corners. Then comes a cornice and balustrade, and above this a tall octagonal lantern, with pilasters at its eight angles. The balustrade does not run round without a break. On the contrary, it is stopped at each corner by projecting pedestals, carrying large vases. These, on the angular view, fill up the sudden break from the square to the octagonal plan, and round off the outline gracefully. The lantern is covered by an octagonal dome of pointed section; and from the top of this springs a slender *fleche* or spirelet, which terminates the composition. Altogether it is a satisfactory piece of design, and it was probably considered when built to be as novel as satisfactory. In a certain sense it was so; in a certain sense there is freshness about it still, and it rather increases than lessens our admiration for the great architect who designed it to know that he produced this effect of freshness and originality with what we may fairly term “old materials.”

Like all WREN's best towers, that of St. Magnus has what is known as a “lantern.” Where did the idea of a lantern-tower first come from? We may trace it back from our own seventeenth-century examples to earlier Renaissance ones abroad; from these to the almost innumerable Gothic ones, and from these again to Romanesque and primitive Romanesque specimens, as old in some cases as A.D. 1060. That, perhaps, is about as far as we can go in Western Europe. But, as it has happened with so many ideas, the germ seems to have come first of all from the East. The lantern-tower was originally what its name denotes, a tower pierced for light. It was in the first instance a structure meant to surmount the “crossing” of a church, as in many cases it still does. Its square base was originally low and insignificant—an unavoidable necessity because of the four arches which carried it, but a necessity which those who first used it would gladly perhaps have got rid of. So we find it at the Theotocos, Constantinople, and at the Metropolitan church, and the church of St. Taxiarchus, Athens. The Theotocos lantern springs from the square with “broaches” or weatherings of low pitch. It is circular on plan, but is surrounded with an arcade of twelve bays, pierced with windows. It is attributed to the ninth or tenth century. At St. Taxiarchus the lantern is octagonal likewise, on a short square base. The Romanesque lanterns of Italy, though later in date, seem closely allied to these. Such, for instance, are those at Parma Cathedral, at the cathedral of Caserta Vecchia, at Pavia, and at San Ciriaco, Ancona. The German Romanesque ones make no great advance on the early Italian. We find them at Laach, at Spire, at Worms, and elsewhere. But when we come to France new lines of pro-

gress at once show themselves, and the type, which was nearly at a standstill elsewhere for three or four hundred years, is seen to be rapidly transforming itself into the perfect lantern-tower. It is now that we begin to find it on a high, square base. It is no longer confined to the point for which it was first intended—the centre of a church, the intersection of the principal and lateral avenues. It takes possession of the bell-tower, and shows us how beautiful that feature may be made.

That is the ancestry of the lantern-tower idea. There is no need to follow it through the Gothic period, or to chronicle its endless group of relations there. The early Renaissance architects continued to use it, and very often they crowned it, as it is crowned at St. Magnus, with a dome. Was this a new idea of their own, this junction of what we are accustomed to think was a Classic covering with a Gothic type of tower? Probably not. It may have been suggested by the Byzantine lanterns of the ninth or tenth century. These were covered by domes visible outside as well as within. Internally they were hemispherical, or nearly so; externally they were segmental, or sometimes of ogee form. In this latter case the convex part of the curve is the upper one; the concave part is only a narrow piece next the outside cornice. But it is not necessary to look as far as Athens for pre-Renaissance examples of the external dome in combination with the polygonal lantern. We can find Romanesque specimens of the arrangement, both in Italy, in France and in Spain. The cathedral of Caserta Vecchia, before named, has a segmental dome of early date surmounting its octagonal lantern. The church of Notre Dame at Les Aliscamps, near Arles, has a still older tower of the same form. And even pointed domes exist as the outer coverings to Romanesque lantern-towers. In Mr. STREET's work on Spain the drawings of two very interesting ones may be found, the first at Zamora, and the second at Salamanca. The latter lantern is really circular on plan, though Mr. STREET's woodcut shows it as a polygon of sixteen sides. The campanile of St. Front, Périgueux, also terminates in a pointed dome, probably anterior by a couple of centuries to these Spanish ones.

If it were not for one or two buildings like the Baptistery of Pisa, where we find an external dome in connection with Gothic detail of the Early and Middle periods, we might be inclined to say that this feature was quite abandoned for nearly two centuries. In the later Gothic it reappeared, generally of ogee section with the concave curve uppermost. What was it that suggested these so-called “pepper-box” domes, with which everyone is familiar at King's College Chapel and in other Perpendicular works? Were they a modified revival of the Classic dome or of the Romanesque dome, or were they entirely a new invention of the fifteenth century? They may have been, as they are commonly supposed to be, the first-fruits in England of the Renaissance which had already begun in Italy. But their character and expression rather suggest that they were a fresh importation from the East, not, as in Romanesque periods, from the Christian East, but this time from the Mahomedan. The later towers of Holland and Belgium have, in many cases, a character and expression wonderfully like that of the Eastern minarets. The resemblance, of course, is not in style or detail; it is a resemblance in proportions and general composition. For example, there is a characteristic type of minaret which begins as a tall, slender, square tower. At a great height a kind of balcony, polygonal on plan and much larger than the square on which it rests, is elaborately corbelled out so as to overhang it all round. Above this balcony the tower goes on again, of a circular or polygonal plan, still more slender than the square shaft beneath. It is a picturesque arrangement, found at the mosque of Beybars, at the mosque of Mahommed el Nagor, Cairo, and elsewhere. But it is an arrangement quite unknown to European architecture down to the late Gothic period, when we suddenly come upon it in the tower of the Hôtel de Ville at Alost. So it is with other types which have the same affinities. It may have been through the extension of commerce with the Mediterranean, it may have been from the growth of a Moorish element derived from Spain; but, however we account for it, there does seem to have been a distinct Oriental influence at work, during the fifteenth and sixteenth centuries, in the towers of the Low Countries, and to some slight extent even in those of England.

The vases which fill in the four spandrels between the octagonal lantern and the square tower of St. Magnus are obviously derived from the great angle-turrets which the Mediæval builders, especially on the Continent, were accustomed to use in this position. These, like most successful devices of the architect, served two purposes—a structural and an artistic one. The structural purposes, indeed, are sometimes not one, but two. When an octagonal lantern surmounts a square tower, the oblique sides of the octagon are usually carried by corbellings or oversailing courses, running out one beyond another. Unless there is a heavy weight upon the ends of the corbel stones, where they tail into the wall of the lower tower, the weight of the oblique side would of course overbalance them. This heavy weight can be obtained in various ways, one of which is to carry the octagon low down into the interior of the square. But a more artistic way was to carry up a very large pinnacle or turret in the triangular space between the oblique side and the square angle. Its weight holds down the backs of the corbel stones, and it fills out and rounds the outline of the steeple on an angular view. Again, when the lantern-tower stands over the crossing of a church, or is in any way supported by arches, these heavy angle-turrets add greatly to its stability. Their pressure turns the line of thrust downwards, and so makes the arches beneath comparatively independent of their abutments. We have not many of these great angle-turrets in England. The western tower at Ely is perhaps our most important example. The Mediæval builders, with us, relied on other modes of construction, and inserted only a slender pinnacle to round off the contour of their lantern-towers. In this respect the vases at St. Magnus follow the English rather than the Continental tradition. They are there for ornament only, not also for use.

The ancestry of the minor details in this composition is pretty obvious. The pilasters flanking each corner of the square tower in its upper stage represent the Gothic buttresses, and so likewise do the angle pilasters on the octagon. The balustrade of course replaces the traceried or embattled parapet. The *flèche* which surmounts the dome, and which by its concave outline contrasts with it so effectively, giving an aspiring character to the whole design, is the most unprecedented thing about it. It is a bold variation on the familiar cupola, but its effect justifies its boldness.

A great deal might be written about the origin of different features in the towers of St. Mary-le-Bow and St. Bride. But there are three of WREN's smaller towers which have been less studied, and which, in their ancestry, are equally interesting. These belong to St. Stephen's, Walbrook, St. James's, Garlick Hill, and St. Michael's, College Hill. They are lantern-towers of a different type from St. Magnus, a type in which the lantern is much less in diameter than the tower beneath it. The first-named may be described as a square tower with a square lantern. This is not a very common form anywhere. There is a Romanesque example of it at Murano, near Venice, and another at Bari, in Lower Italy. The well-known tower of the Palazzo della Signoria, at Siena, also belongs to the class, but it is disguised by the great projecting gallery from the centre of which the lantern rises. The Giralda at Seville is, however, the chief example of the kind. It is too well known to require much description. For nearly three-fourths of its height it rises square and unbroken. There are in this part no buttresses and no pilasters. Till near the top of it the work is Moorish, but Moorish of a more delicate and refined sort than that of the Torre Nueva, otherwise called the leaning tower at Saragossa, now demolished or in process of demolition. The square ends with a Renaissance belfry stage and a balustrade. Inside this comes the lantern. It is square, like the work below, but not quite half as wide, and it is finished by two circular stages, each less in diameter than the stage below it. The Giralda is a very large tower, and that of St. Stephen's quite a small one. Yet the general description of the one would almost serve for the other. Both have the same tall, unbroken square as a base. Both have balustrades spaced, as regards the pedestals, in much the same way. In both cases the corner pedestals carry scrolls or vases. Both have square lanterns of small diameter, pierced by a large opening on each of the four faces, and both lanterns have pedestals and

vases to finish them at the corners. Here the resemblance ends. St. Stephen's tower is not a reduced copy of the Giralda, but it bears strong marks of being amongst its descendants. And the descent may have been direct and immediate, for so celebrated a tower as the Giralda was probably familiar to WREN from drawings, though not from observation.

St. James's 'Tower, Garlick Hill, is much like St. Stephen's. Built two or three years later (in 1683), it shows the sort of difference which one would expect from an inventive architect who had the opportunity of repeating, with improvements, some previous work. But St. Michael's, College Hill, the third of the group, has a lantern of another kind—the most successful of all. There is the same tall, bare tower to begin with, and the same balustrade at top of it. But the lantern is now an octagonal one. It is small in diameter, standing far within the outline of the square which supports it; and thus it differs materially from the wider lanterns of St. Magnus and St. Mary-le-Bow. Even in the Middle Ages, these octagons of reduced diameter, surmounting a square tower, were the exception rather than the rule. There is a fine late Gothic example at Toledo Cathedral, another at Segovia, and others scattered here and there in Italy. The great difficulty in designing them seems to be the effect on an angular view. Seen from a point facing any side of the square, they are pleasing and graceful. But when the eye is opposite the diagonal, the corners stand out too far, the octagon looks too small. There is a violent break in the contour, and the upper part of the design hardly seems to belong to the lower part. So it is to some extent at St. Michael's; and so, indeed, in a much less degree, it is at Bow. The former lantern consists of three stages, all either circular or octagonal, and each more slender than the one below it. We may suppose this to be a variation on the Giralda theme, by substituting round or polygonal stages for rectangular ones. But it is worth remarking that we have in England a curious Perpendicular tower—and one which WREN was probably acquainted with—similarly consisting of a small octagonal lantern rising out of a larger one, and that out of a square. This is at Sutton, a few miles from Ely, on the road to Huntingdon. There are few examples of the kind, and this one, different as it is in detail, may yet have had some share in suggesting the graceful steeple at College Hill.

THE BRESSA PRIZE.

THE Royal Academy of Sciences of Turin, in accordance with the last will and testament of Dr. Cesare Alessandro Bressa, and in conformity with the programme published December 7, 1876, announces that the term for competition for scientific work and discoveries made in the four previous years 1889-92, to which only Italian authors and inventors were entitled, was closed on December 31, 1892. The Academy now gives notice that from January 1, 1891, the new term for competition for the ninth Bressa Prize has begun, to which, according to the testator's will, scientific men and inventors of all nations will be admitted. A prize will therefore be given to the scientific author or inventor, whatever be his nationality, who during the years 1891-94, "according to the judgment of the Royal Academy of Sciences of Turin, shall have made the most important and useful discovery, or published the most valuable work on physical and experimental science, natural history, mathematics, chemistry, physiology, and pathology, as well as geology, history, geography, and statistic." The term will be closed at the end of December 1894. The sum fixed for the prize, deducting the income-tax, will be 10,416 francs (ten thousand four hundred and sixteen francs).

The person who intends to concur at the competition must declare it within the time above mentioned, by means of a letter addressed to the President of the Academy, and send the work with which he concurs. The work must be printed; manuscripts are considered as nothing. The works of the concurrences which do not obtain the prize will be returned to them, when asked for within six months from the adjudication of the prize. None of the national members, resident or not resident, of the Turin Academy can obtain the prize. The Academy gives the prize to the scientific man considered most worthy of it, even if he has not presented himself at the concourse.

The Contract for the restoration of Toddington Church has been secured by Mr. L. Giddings, of the Marble, Granite and Stone Works, Luton. Mr. R. W. Edis, F.S.A., is the architect.

NOTES AND COMMENTS.

A FRENCH gentleman who had survived the first French Revolution, although he dwelt in Paris, was asked what he had done at so important a time. He replied that he had lived; and no doubt he considered that was a triumph. A trade journal which contrives to exist during fifty years may also claim to have a triumph, and especially when it has had to create a *clientèle*. Our contemporary, *The Builder*, to-day celebrates a jubilee which deserves recognition on the part of journalists, and we offer our congratulations to the conductors. It should not be forgotten that it was necessary to convince builders and workmen about the advantage of having a journal to represent them; and there is no doubt our contemporary has, in return for their support, rendered them and the community many services.

THE Chapelle Expiatoire, which was erected in Paris about 1826 as a memorial of LOUIS XVI. and MARIE-ANTOINETTE, is severely monumental in character, and makes its site in the Rue d'Anjou appear as part of a cemetery. It was designed by PERCIER and FONTAINE, and as a shrine for cenotaphs it must be considered a successful work. Although a memorial of an act that at the time was considered righteous, the chapel has become obnoxious to advanced Republicans, and its demolition was agreed to last week in the Municipal Council. If the site were required for some public building, there might be some excuse for the proposal, but the chapel is to be superseded by a bust of LEPELETIER DE SAINT FARGEAU, "enfant de Paris," who was killed in the neighbourhood. As an example of architecture the building deserves preservation. Fortunately the sanction of the Prefect of the Seine has to be obtained, and probably he will consider that the taxes could be expended more wisely than on demolition of monuments.

It is desirable that the superior Courts should give a decision on the liability of builders to pay "grinding money." The magistrates of the metropolitan police courts are evidently divided in opinion on the subject. If an employer belongs to the Central Association of Master Builders and accepts the rules about the payment of an hour's wages on account of "grinding money" it is a tacit agreement, and he must expect that a magistrate will be against him in case of non-payment. But supposing a member does not read the rules on the subject, is he to be compelled to pay the money? A decision given on Monday by Mr. DENMAN would sustain an answer in the affirmative. Several carpenters claimed 9½d. each from Mr. STONE, of Wandsworth. He declared that when he engaged the men there was no reference to the rule, and that he was not acquainted with the practice. The magistrate, however, concluded that the rule as to the payment of an hour's wage in lieu of notice was adopted by the defendant with a full knowledge of the terms of the association. He therefore made an order for the payment of the amounts claimed. It may be reasonable, as Mr. DENMAN said, that carpenters should have an hour to put their tools in order, although the practice does not prevail in other trades, but it would be well to have a judge's assurance to that effect. We hope, therefore, that arrangements will be made to have a test case brought before the High Court.

A THIRD edition of the "Handbook of Regulations and General Information" has been issued by the Royal Commission for the Chicago Exhibition. It contains useful information about all departments for exhibitors and visitors. Many traders with America will also be glad to have the careful abstract of the MCKINLEY tariff, which has caused much inconvenience in this country. The report on the progress of the British section is brought up to the end of the year. According to it the space to be occupied by Great Britain and the Colonies in the buildings and grounds will probably amount to more than 500,000 square feet, of which about three-fifths will be occupied by Great Britain. This is the largest area ever occupied by the British section at any foreign international exhibition. At Vienna, 1874, the space occupied was

169,827 square feet; at Philadelphia, 1876, 194,381; at Paris, 1878, 363,018; at Paris, 1889, 232,845. It is considered that the most important part of the British section will be found in the Transportation Building, in which railways, shipbuilding, &c., will be represented. In the Fine Art Department, the collection will probably be as good as has ever been sent out of the country. It is gratifying to learn that "all the arrangements for the British section are thoroughly well advanced. The allotments to nearly all the exhibitors have long since been made, in order to give them ample time for their preparations, and these preparations are in most instances well in hand. There is, therefore, no reason to fear but that the section will be, as British sections always have been, ready on the day of opening. It may be remembered that in Paris in 1889 the only foreign section which was complete was the British; it was very far advanced of nearly all the French courts. The only catalogue in the building on the opening day was the catalogue of the British section." In face of the prejudice against international exhibitions on account of their unprofitableness, which has increased of late years, the Commission have succeeded beyond anticipation, and if it were not for the efforts of the members and secretary very few British manufacturers would have sent goods to Chicago.

THERE was a famous fount in Athens known as Kallirhoe. In the beginning of the century it was a subject that was very useful for contests among archaeologists and scholars. There was also mention of a fountain called Enneakrounos, and of another as Dodekakrounos. Were they different sources of supply, or did the three names designate one fount? Over those questions there has been war. PLINY supposes there were two fountains; but, from what THUCYDIDES says, it is inferred there was only one, which used to be known as Kallirhoe, and which had nine mouths. STATIUS also refers to the nine mouths, while PAUSANIAS describes Athens as having only one spring, called Enneakrounos, although there were several wells. A spot below the Olympieion was supposed to be the site, and about a mile to the west, in the direction of the Piræus, was a fountain which was considered as derived from the underground waters of the spring. According to a telegram from the correspondent of the *Standard*, Dr. DÖRPFELD announces confidently that he has discovered the spring on the road on the south-west of the Acropolis, facing the Propylæa, and leading to the Agora, or market-place. No inscription has yet been found, corroborating Dr. DÖRPFELD'S view, but he bases it on certain objects, including pipes soldered with lead, fragments of marble, and other indications, which he attributes to the age of PISISTRATUS, in the sixth century B.C. According to some old scholiasts the famous "tyrant" erected an ornamental structure over the spring.

THERE are many people in France who believe that there should be only one great exhibition of works of art in the year, and that all rivals of the Salon merit suppression by the Government. As long as the Committee of the Société des Artistes Français endeavour to become more exclusive and privileged, it is not likely that any Minister dare give his countenance to their ambition. The latest effort was to abolish the right which every artist who had exhibited a work in the Salon possessed, and by which he was allowed to vote in the elections for the committees. It was considered that the aims of the gentlemen who wish to rule with strong hands would be advanced if only those artists who have exhibited during five years or who have received rewards were allowed to have the privilege of voting. The members of the Société have of late so meekly complied with all demands of the committee, it was of course anticipated that the proposal would be accepted. But for once there was resistance, and by a majority of a hundred the right to vote was preserved to the majority of the members. It must be said they are hardly worthy of the suffrage. They have permitted the committee to become absolute and to act as masters, and if there is an endeavour to restrict the voting to one *clique*, it is only the natural consequence of the exercise of unrestrained power.

ILLUSTRATIONS.

THE IMPERIAL INSTITUTE, SOUTH KENSINGTON.

WE published a view on a large scale of Mr. COLLICUTT's design for the Imperial Institute after the competition. It will be interesting to compare it with the photographic views of the parts of the building which we publish to-day. For it will be seen that the architect has made alterations in detail, and the pains which have been taken suggest one of the causes of Mr. COLLICUTT's success. The sculpture, which was an element of the design, has yet to be introduced, but, in spite of its absence, the building may be pointed to as a sign that architecture still is a living art in England.

THE HISTORY OF JOAN OF ARC.

WHEN it was decided to have the walls of the Panthéon in Paris painted by the foremost artists in France, the intention was to illustrate the history or legends of St. GENEVIÈVE, to whom the building was dedicated at the time. Soon afterwards the painters were allowed to have more scope in the selection of the subjects. If M. PUVIS DE CHAVANNES and M. JEAN PAUL LAURENS kept to the traditions of the patroness of Paris, who lived in the fifth century, M. LEVY selected CHARLEMAGNE, the restorer of order in the eighth century, as his subject, while M. CABANEL depicted scenes in the life of St. LOUIS, the representative king of the thirteenth century. The illustration we publish this week shows that M. LENEVEU has taken events of a later period, that is, the tragedy of JEANNE D'ARC, of which the final scene was gone through in 1431. Far apart as were the transactions which are represented in the Panthéon, most of them unite in revealing the power which faith in the unseen exercised at different times among the French people. GENEVIÈVE, CHARLEMAGNE, LOUIS and JEANNE were alike confident that they were inspired to undertake most difficult duties, and were to have more than human help to support them against their opponents.

M. LENEVEU in his paintings is careful to suggest a condition of mind in JOAN which may be called ecstatic, and is exhibited in three states. The pained expression which denotes her great fear when the mysterious voices were heard ("et primâ vice habuit magnum timorem") is contrasted with the satisfaction which was felt when CHARLES was crowned, and with the hope that afterwards was able to overcome the terrors of the martyrdom. It must be said that of late years French artists are rather indifferent to the portrayal of emotions, and many of them would have painted a similar series of scenes without troubling themselves about the manner in which JOAN's features were moved by her feelings. M. LENEVEU is so thorough in his method he could not pass lightly over any detail, and as he has spared no pains to be exact in costume and accessories, he has likewise endeavoured to reveal to his countrymen not only the appearance of the peasant girl in the periods of inspiration, struggle, triumph and martyrdom, but also the enthusiasm by which deeds were accomplished which were a puzzle to her contemporaries and are incomprehensible to people of a later time.

Political events have of late years surrounded the memory of JOAN OF ARC with a novel interest. As she was born in Domremy, which is in the valley of the Meuse in Lorraine, JOAN has been accepted as representing the grief which has made many Alsatian women wear black, and the desire to revenge the losses of the last war which prevails among Frenchmen. Accordingly an equestrian figure of JOAN has been set up in Nancy, and she is represented as if leading her countrymen towards the captured provinces. If the morals of the heroine of Orleans were no better than those of Mdle. THÉROIGNE, who led the women of Paris to Versailles and captured the cannon of LOUIS XVI. (she also had her martyrdom, for she was driven mad through a fustigation by her countrywomen), JOAN would still be accepted as the genius of militant patriotism. Many of the people who lay wreaths on the figures of JOAN in Paris and Nancy may be as sceptical about her virtues as was the Bishop of Beauvais or MONSTRELET or VOLTAIRE, or the author of the first part of "King Henry VI." Are they to be blamed? In a case where so much is doubtful we must tolerate many interpretations. The more the circumstances

are investigated, the more difficult is it to draw a conclusion.

With the evidence relating to the astonishing events which occurred in France before him, a man is likely to judge of the character of JOAN OF ARC according to his own idiosyncrasy, and make the history serve any theory he may wish to set up. Thus it is that M. MARIN, after an exhaustive study of the contests, concludes that JOAN was possessed of military genius. Herr MAHRENHOLZ, on the other hand, maintains that all she performed was dictated by an inferior officer. M. LESIGNE concludes, after his researches, that JOAN was not consumed in Rouen, but married a noble and brought up a large family in happiness. M. SIMÉON LUCE believes she was an agent of the Franciscans, while M. CHAPOTIN asserts that she was controlled by the rival order, the Dominicans. If the history related to an earlier time and a different country, it would be called mythic. It would be well if the darkness were more generally accepted by the French. It now suits them to utilise the fame of JOAN OF ARC as if she were an Alsatian in revolt. At another time she may be turned to account against the English, who are supposed to have been her executioners. Yet, if there is any truth in the records, her most bitter enemies were Frenchmen.

It would be out of place to attempt here any new theory on the subject, but a few notes may be given from the records of JOAN'S trial (they have been reprinted in five volumes, with notes by M. JULES QUICHERAT) and other sources, which will help to explain M. LENEVEU'S series of paintings.

JOAN was born on the festival of the Epiphany in 1412, and was the child of JACQUES D'ARC and ISABELLE ROMMÉE, who were peasants. According to MICHELET, her Christian name was really JEAN, after the Evangelist, and because a descendant of her brother in 1612 called himself DARC, some assume that was the surname. The Dukes of LORRAINE, including the little village of Domremy, were generally found among the allies of the French kings when they were at war, but at other times the Dukes fought against France. In the beginning of the fifteenth century, Lorraine, although surrounded by English and Burgundian troops, was faithful to the House of Valois, that then was nearly overthrown. The battle of Agincourt was fought in 1415, that is, when JOAN was three years old. CHARLES VI., who was driven mad by his calamities, died in 1422. His successor, the Dauphin, was not the kind of ruler that could rescue France from the English troops. The reality was terrible. Intelligence of the defeats, we suppose, reached Domremy in an exaggerated form, and could hardly fail to excite an impressionable girl like JEANNE D'ARC. Her parents' cottage was near the village church, as is seen in the painting. The sounds of the bells gave her extreme pleasure. There was also a remarkable beech tree beside her home, which was supposed to be in some way connected with the fairies, and it was referred to at her trial as a scene of superstitious acts on her part. JOAN occasionally kept her father's sheep, but most of her time was spent inside the house. M. LENEVEU represents her as holding a distaff, for, when describing her youth, she declared before her judges that she was not afraid of competing in spinning and sewing with any of the women of Rouen ("nec timebat mulierem Rothomagensem de nendo et suendo").

It was in her thirteenth year that JOAN appears to have had the first of her mysterious manifestations. On her right side a light arose, and a voice advised her to be good, and to frequent the church, and also announced that she was at a future time to visit France. Subsequently St. MICHAEL appeared, as is represented in the painting, and informed JOAN that St. CATHERINE and St. MARGARET, who are shown above, were to be her guides. These visions continued for four years, and she was silent concerning them. It was testified that in no way was she made vain by them. In 1429 she was told the time for the delivery of France had arrived, that she was to visit the Dauphin at Chinon, and ask for troops to raise the siege of Orleans. When she expressed fear, it was said that if Sir ROBERT DE BAUDRICOURT were applied to, he would give her an escort to bring her to CHARLES.

Accompanied by her uncle, she went to BAUDRICOURT, who had JOAN exorcised. Then she was sent to Nancy, to the Duke of LORRAINE. Eventually, she found.

her way to the Court at Chinon. The story about her recognition of CHARLES amidst a crowd is well known. DE QUINCEY considers the whole affair was a mere trick of legerdemain, such as may be seen any day for a shilling, and he says he was surprised to hear SOUTHEY owning a secret bias in favour of JOAN, founded on the detection of the Prince. Prejudiced as was the writer of "Henry VI.," he took a more worthy view of the transaction, and it would appear from the evidence at the trial that there was no collusion at Chinon. Besides, JOAN was sent to Poitiers, and there for three weeks was subjected to all the examinations which were supposed to be efficacious in detecting impostors. The reports of the inquiry at Poitiers are lost; but as JOAN at her trial repeatedly referred to them, they must have been in her favour. The ecclesiastics decided that the Dauphin might lawfully employ her services. CHARLES gave her a suit of armour; from the Duke of ALENÇON she obtained a black war-horse. For the sword she ordered a search to be made in the church of St. Catherine at Fierbois. The banner was made according to instructions given by the voices. It was of white linen, on which images of CHRIST and the Blessed VIRGIN were painted, with the crown and lilies of France. M. LENEVEU follows these details. The banner seemed to exalt her spirit; with it in her hand she rode about the camp at Chinon. In "Henry VI." JOAN professes to be changed in appearance after one of her visions:—

And whereas I was black and swart before,
With those clear rays which she infused on me
That beauty I am bless'd with which you see.

The lines express the tradition as it was known after a couple of centuries; but according to the evidence JOAN was swart, short and active—"erat brevis quidem staturâ, rusticanâ facie et nigro capillo, et toto corpore prævalida"—the sort of girl that was to be seen in many peasants' cottages. She was not, however, unfeminine, for, like CORDELIA, her voice was soft, gentle and low—"vocem mulieris habet ad instar gracilem"—and to the youths in the army she seemed to be something divine.

JOAN appeared before Orleans on April 12, 1429. LINGARD, who believes she was the victim of a delusion which, however, nerved and elevated her mind, says that care was taken by the French to communicate her history with due exaggeration to the English who were besieging the city. The men concluded she was either an impostor or a sorceress, and became as afraid of one as of the other. There were two tasks before the French. The first was to throw supplies into Orleans, where there was famine, an operation that was successful, apparently without loss of life, owing to the terror which JOAN's name inspired. The second was to compel the English to depart. JOAN's tactics, as described by herself at her trial, were very simple. "I told the soldiers," she said, "to boldly enter among the English troops, and I also entered boldly." About sixty temporary fortifications had to be conquered, and there were ten days of fighting before the siege was raised. TALBOT and SUFFOLK invited a renewal of the contest outside the walls, but JOAN would not allow the French troops to leave Orleans. The victory was completed on Sunday, and she said, "En nom Dieu, laissez-les partir, et allons rendre grâces à Dieu." How much the presence of JOAN contributed to the triumph is seen from the letter of the Duke of BEDFORD, who was the English regent. "The courage of the soldiers," he wrote, "was shaken by lack of belief and the unlawful doubt of a disciple and limb of the fiend, called the PUCELLE, who used false enchantments and sorcery."

The rescue of Orleans was the flood in the tide which, rightly taken, would lead to fortune. JOAN OF ARC, whose mission was to see the Dauphin crowned at Rheims, was eager to follow up the victory, but for a time CHARLES was dilatory. At length JOAN's advice was followed. Jargeau, Mehun, Eaugeny and Patay were attacked and taken. On July 14, 1429, Rheims was entered.

On the next day, which was Sunday, CHARLES was consecrated in the cathedral. Most historians relate that, as soon as the ceremony was over, she threw herself on her knees before the king, embraced his feet, declared her mission accomplished, and with tears solicited his leave to return to her former station. But the evidence at the trial does not recall a scene of that kind. Nor is SCHILLER'S

treatment more warranted, for, according to CARLYLE'S abstract, "Amid the tumult and magnificence of this royal pageant she sinks into a reverie; her small native dale of Arc, between its quiet hills, rises on her mind's eye, with its straw-roofed huts and its clear green sward, where the sun is even then shining so brightly, and the sky is so blue and all is so calm and motherly and safe. She sighs for the peace of that sequestered home; then shudders to think that she shall never see it more." M. LENEVEU is more true to the depositions when he represents JOAN as standing firmly while she offers her thanksgiving for what is past, and resolute to meet the future. She is not exhausted, and appears to feel that her task is not accomplished while an English soldier remains in France. That in the course of the day she talked about death with the Archbishop was only natural with a girl whose visions did not reveal her own fate.

Enthusiasm is rarely of long duration among soldiers, and it is not surprising that the officers soon after the coronation began to treat poor JOAN as one of the worst amateurs. She was not consulted about movements, but when failure occurred she bore the blame. At last at Compiègne, in May 1430, she was deserted, and taken prisoner by JOHN OF LUXEMBOURG, who was a Burgundian. Then came the turn of the men of peace. Whether inspired by heaven or hell, she was an exceptional subject, and it was the business of science to endeavour to discover the complicated movements which produced such remarkable effects. Theologians, metaphysicians, moral philosophers, devil's advocates, were all eager to take part in the analysis of the heroic girl's mind. The University of Paris, that claimed a sort of monopoly of the most interesting victims, lost no time in applying for the possession of JOAN. But the operators were not trusted by the Burgundians and their allies, for JOAN in Paris might obtain the benefit of a doubt. The English, too, were anxious that their defeat might be explained by the influence of infernal powers, and for that end it was only necessary to make JOAN out a sorceress. There was no difficulty in finding an agent. When Beauvais fell into the hands of the new king whom JOAN helped to create, PIERRE CAUCHON, who favoured the Burgundians, was deprived of his bishopric. He fled to England and became an adherent of the House of Lancaster. The archbishopric of Rouen was promised to him. It happened that the spot where JOAN was captured was near the boundary of the diocese of Beauvais. CAUCHON accordingly claimed jurisdiction over her; HENRY VI. of England also set up a claim on the prisoner. Eventually she was delivered and brought in chains to Rouen. The trial went on during four months. The Bishop of Beauvais presided, and he had the help of forty-two assessors, who represented moral theology, canon law, and civil law. JOAN was examined during five days in court and six days in prison. In a contest with dialecticians she could hardly expect to succeed, but her inconsistencies are not of account. The answers were analysed, and twelve propositions made out of them were submitted to the University of Paris. The assessors, we suppose, were associated with that learned body. At any rate, no time was lost by the University in condemning the propositions as blasphemous and heretical. On Whit Monday, in 1431, JOAN was doomed to death for apostasy and sorcery.

SAVONAROLA lost his prophet's strength under torture and signed a confession of guilt. Is it surprising that JOAN OF ARC should also reveal a human weakness, and when she thought of the fire that awaited her should lose confidence in her inspiration? She signed a retraction, and her punishment was changed to imprisonment for life. For some reason that remains unexplained she ceased to be a prisoner of the Church, and was handed over to the English authorities. Then came a revulsion of feeling. Once more the memory of the spirit voices overcame her, and she was filled with remorse at her disloyalty to her guides. JOAN spoke about her divine inspiration, and as all her words were noted, information of the change was brought to her judge. The words might easily have been interpreted as the result of delirium brought about by her sufferings, but State policy made it necessary that JOAN should pass from life as a being that was less than human.

The last scene of all has been depicted by M. LENEVEU.

with rigorous exactness. The judges were present, but their formalities on such an occasion were observed with impatience by the soldiers, who asked if they were to be kept waiting until dinner-time. The employment of a soldier to carry faggots and the raised arms of others suggest that there was a stain on the army which could only be removed by a fire like that which was about to be lighted. No cross was allowed to be borne by JOAN, but a soldier, out of pity, broke a staff in two, tied the parts together, and gave them to her. She held it, but begged for a crucifix. The scaffold was made higher than usual, in order that all might see whether the executioner was merciful and allowed the culprit to be smothered. In JOAN's case there was to be no abridgment of the torture. It is satisfactory to learn that the consolation of believing in heavenly guidance came back in that supreme hour with stronger power. She could be considerate for the monk who brought her the crucifix, and implored him to descend before he suffered through his humanity. It must be admitted that not much was gained by her execution. The power of England was not made more enduring by her absence from France. But it must be admitted that throughout the proceedings there was a regularity which was not always witnessed in State trials. The judges acted according to their lights, and for many a year afterwards in Europe and America unhappy women were burnt whose guilt appeared less manifest than that of the peasant girl of Domremy. If M. LENEPVEU's paintings will teach all who look on them to be tolerant to genuine enthusiasm in every form, the Panthéon may still be taken as a place of wise counsel.

A FLORENTINE NECROPOLIS.

THE early history of Florence will have to be rewritten says a correspondent of the *Scotsman*. When such a master of ancient Italian geography as Mr. E. H. Bunbury can tell us that "no trace of its existence is found in Etruscan times," and when the excavator's pick is constantly turning up fresh treasure-trove of the pre-Roman epoch, the historian of the city, it is obvious, must go behind his old starting point, and even then be in doubt as to whether he may not have to recede yet another step into "the dark backward and abysm of time."

In the centre of Florence stands the new Piazza Vittorio Emanuele, and in that ample square are being constructed the premises of the Simonelli firm. Sinking a cellar in this establishment, at a point near the Via degli Anselmi, the excavators had reached a depth of 4 m. 75 cm., when they came on a Roman pavement. This they removed, and found it to rest on a layer of virgin sand, in which they lighted on a vase, almost entire—in height 0.33 cm., in its greatest circumference 0.89. Its form was the usual one, conical with truncated top and bottom; its material the black, or rather blackish (*nerastra*), clay, rudely sun-dried, proper to vases of the kind. It was without ornamentation, and furnished with a handle horizontal to the top. Its mouth was almost entirely broken, but the fracture was not recent, dating (such is the conjecture) from the time of the construction of the Roman pavement under which it was found—a time, to judge from two coins picked up on the said pavement, certainly not later than that of the Emperor Marcus Aurelius. Inside the vase itself was earth mixed with ashes, and among this some fragments of bronze. Such was the precious object that presented itself to the astonished and exultant eyes of Professor Milani, who was not long in concluding that it was an "ossuario tipico e rituale delle antichissime necropoli Italiche, pre-Etrusche e Palæo-Etrusche" (a characteristic ritual bone-urn of the most ancient Italian, pre-Etruscan and Palæo-Etruscan cemeteries.)

That the "ossuario" was as little damaged as it turned out to be is due to the care of the superintendent of the excavations, Signor Montagnoli; possibly also to the expectation of the workmen that it might contain coin. As it was, the utmost caution was exercised in lifting it from its bed and in removing from its interior the earth which had become mingled with the bone-dust. In this latter process two pieces of bronze were taken out by Signor Montagnoli, which were afterwards supplemented by other two in the more careful scrutiny of Professor Milani. These were found to be parts of a *fibula* or clasp, with an undulated arch, and twisted like a rope. The presence of such a *fibula*, and the absence of the half-moon shaped razor which is an almost invariable accompaniment of the "ossuari" of men, led Professor Milani to conclude that the tomb to which the "ossuari" belonged was that of a woman. Tombs of this kind, moreover, are never isolated. Hence it is reasonable to suppose, with Professor Milani, that "la prima tomba

Italica" (the first old-Italian tomb) found in central Florence is the prelude to the discovery of a veritable "sepulcretum" or burial-place. Whether this "sepulcretum," exposed to the light of day after thirty centuries, is to be regarded as "Old-Italian," "Etruscan," or "pre-Etruscan," will put local archaeology to the test for some time to come.

Meanwhile the care imposed on the excavators in the Piazza Vittorio Emanuele must be extreme. Their task is to follow up this primary nucleus of an old Italian life-centre, and it is to be hoped that the municipality and the Legislature itself will see that no impediment is put in their way. Fiesole herself, 1,000 feet above the Val d' Arno, from which, according to tradition, Florence had her origin, can show nothing equal, in point of antiquity or interest, to this newly-found "ossuario." Should this fact be further confirmed, the history of Florence, as I have said, will indeed have to be rewritten. Treasure-trove of a scarcely less significant character had lately rewarded Professor Milani's investigations. Walled in behind the Church of San Tommaso, at the corner of the Via de' Cardinali, he came upon a bit of sculpture, carved out of indurated sand. At first it was thought to represent the armorial bearings or insignia of some ancient Florentine family, because on its exposed surface appeared a griffin rampant, of apparently mediæval workmanship. When detached from its setting, however, it was seen to be an Etruscan "cippus" (small truncated column), on which was wrought the effigy of the chief Etrurian divinity—Vertumnus, the god of the changing year, of the seasons and their productions, associated with a griffin and two lions, his solar emblems. Such a monument, very rare by itself, reflecting the style of the second half of the sixth century before Christ—a monument which, in point of art, is allied to the Etruscan cippi of the Florentine territory—might be held to have come from the neighbouring Fiesole. But an Apollo-like idol, on a *bijou* scale, of bronze, dating from about the same period, and of the same "cippiform" character, found last year in the excavations in front of the Church of San Tommaso, put it beyond a doubt that the above-mentioned "cippus" formed part of an Etruscan cemetery existing hard by. And now to-day the "tomba Italica," unearthed at the opposite angle of the Piazza Vittorio Emanuele, reinforces the conclusions already set forth. Professor Milani's report on this last "find" supplies the details just given, and, addressed to the President of the "Historico-Artistic Commission" of the Commune, will shortly be published in the "Notizie degli Scavi" (Notes of the Excavations).

ARBROATH OLD CHURCH.

THE Town Council of Arbroath have considered the opinion of the Lord Advocate and the Dean of Faculty respecting the questions submitted to them as to the restoration of the old parish church, which was destroyed by fire on November 14 last. Counsel, holding that the parish is burghal, as decided by Lord McLaren in the Glebe case, and assuming that the church could be restored without rebuilding, which would raise different considerations, were of opinion that the primary obligation to restore rests on the magistrates and Town Council, and not on the heritors. But the history of the church showed that for more than a century the upkeep and repairs had been defrayed by apportioning the expense among the proprietors of the pews and galleries, including the Town Council as owners of a gallery, and counsel were disposed to think that this rule would be followed. They were of opinion that the proprietors of pews would be entitled to have the area of the restored church allocated as nearly as possible in the same way as before, and to that extent they were entitled to be consulted in the arrangement for restoration. In this question those who held land in the parish were not in any different position from those who did not. Counsel were of opinion that the Incorporated Trades could be compelled by their trust constituents to restore their galleries so far as they were injured, but if they did not restore them they would have no right in the restored church. The new allocation of the church should be in accordance with pre-existing rights. As the state of matters which had come about was very exceptional, and the law regarding it was not well cleared up by decision, counsel strongly recommended all parties to settle the matter by agreement. In particular, while they thought the legal aspect of the case pointed to the restoration of the old state of things within the old fabric, it might well be that all interests would be better served by rebuilding. This, however, could only be attained by the harmonious action of all concerned. After discussion in the Town Council, it was resolved "that the magistrates and Town Council agree to take upon themselves the duty of proceeding with the restoration or rebuilding of the old church in accordance with the opinion of counsel to the extent that the insurance money which may be received will enable them to do so, and that a committee be appointed to confer with the kirk-session and the pew proprietors and any others having interest as to the steps to be taken for that purpose, and to report." A committee was appointed to carry the resolution into effect.

WESTMINSTER CLOISTERS AND NATIONAL MEMORIALS.

THE dead, by a simple euphemism, in Greece and Rome, were often called "the greater number," and ever since the description became a true one, the disparity between the forces of the dead and of the living has gone on increasing, until now the number of the great alone among the dead becomes too great for us to find them fit resting-place. The continuity of the national life for long centuries is one of the glories of Englishmen, and by nothing is this shown in a manner more impres-

sive upon the senses than by the splendid collection, or rather accretion, of memorials which leave a lasting memory on all who have but hastily glanced over them, and even form the principal part of the picture in the minds of such as have never had the opportunity of actually seeing Westminster Abbey.

Magnificent, however, as Westminster Abbey is, it falls short in magnitude of many buildings that cover memorials far fewer and even of less interest, and spacious as it is it has long been overcrowded. Considering the high esteem in which the building has for so many centuries been held as a burial-place of the great, it seems marvellous that its limited space should have been so squandered, as at some time it has, on memorials of men of inconsiderable importance who have thus excluded worthier successors. Such has, however, been the case, and now it is practically impossible to find place of burial here for our great men, high as is the standard of worth before we now admit that a man has a claim to so great an honour—scarcely, indeed, can the room be found for so much as a tablet of memorial.

The possibility of memorial within those parts beyond which the custom has not hitherto spread has reached its practical limits. Unless the number admitted to the honour of memorial within the Home of National Memorials is to be so restricted that the line of historical monuments, unbroken for some eight centuries, is for this and coming generations to be unduly thinned, additional space must be found, or the present limits extended.

When the matter was lately before a Royal Commission it seemed, indeed, to be thought unnecessary to discuss any possibility of being satisfied with any existing accommodation, and their attention was addressed

The Interior of Mr. Pearson's Chapel on the site of the Refectory.

almost entirely to the question of the best way of providing additional room by a new building. Where, however, should this new building be put? Several positions were suggested, each having some peculiar advantage, and between two of them the Commissioners came to no ultimate decision of recommendation.

The suggested sites (for the adaptation of some alternative plans were put forward) which principally occupied the attention of the Commissioners were as follows:—Omitting the suggested cloister of Sir GILBERT SCOTT and the transept of Mr. FERGUSSON, which in point of time came first, the earliest suggestion with which the Commissioners were concerned was that of Mr. PEARSON (based in a measure on that of Mr. FERGUSSON) for a monumental chapel, consisting of a broad central and two narrower side aisles, and connected by a low cloister with the Abbey by an entrance from Poets' Corner, a plan which would involve the demolition of several houses in Abingdon Street, and which for this reason was afterwards somewhat modified. Later Mr. PEARSON gave evidence on his suggestion for a building

on the north side of the nave, taking the form either of an additional north aisle to the Abbey, communicating with it by the west end of the nave and the north transept, or of a double cloister, enclosing a garth, and communicating in the same way. Mr. PEARSON'S preference was for the form of a new north aisle.

Next Mr. SOMERS CLARKE brought forward a plan which had been adopted by Mr. SHAW-LEFEVRE for a chapel on a site east of the chapter-house, with frontage to Old Palace Yard and entrance through the existing door in Poets' Corner.

A much larger scheme was put before the Commission by Messrs. SEDDON and LAWRENCE HARVEY for a monumental chapel facing Abingdon Street, which would be connected with the Abbey by a broad cloister, which could be built as need should arise and could be almost indefinitely extended, running along Old Palace Yard and under the buttresses of the chapter-house, to be entered from the Abbey by the doorway at Poets' Corner.

Another suggestion, in illustration of which again Mr. PEARSON produced sketches, was to build upon the ancient site of the refectory, the north wall of the new building being the south wall of the great cloisters, and the entrance

to the new chapel being through the west walk of the cloisters.

Such are some of the various suggested positions for a

the new chapel, if one were to be built, should be so closely connected with the Abbey as to form a part, an integral part of it, as much so as do the present chapels around the

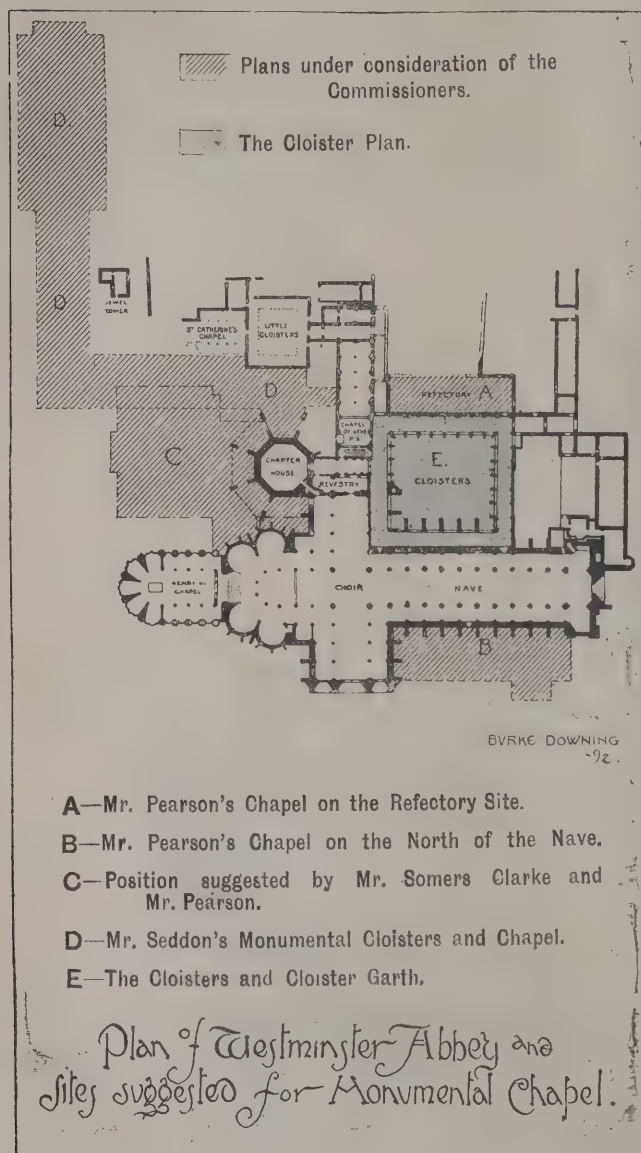

Within
the Cloister Garth
Westminster.

BYRKE DOWNING.

new monumental chapel, but to every one there seems considerable objection. The witnesses examined by the Commission seemed generally agreed, and rightly so, that

Abbey. Indeed, if this view be not taken, there seems to be no reason why the monumental chapel, if we are to have one, should necessarily be located at Westminster or close to

the Abbey. Can it, however, be said that the suggested positions would give to the new building this peculiarly close association? In most cases probably not. In two of the cases the actual monumental chapel would be at some distance from the Abbey—in the one case, in which a very imposing scheme was proposed, a very considerable distance—and the connection would be a newly-built cloister. The passage from the one to the other, it is true, would be under cover, but it would be hard to deceive oneself into the belief that one had not left the Abbey, and the difficulty would most likely be increased by the name that the cloister would certainly run the risk of acquiring—the “new addition,” or some similar phrase—and we all know

how such names live even after they have become absolutely false as descriptions.

This objection is not so strong in the case of the suggested chapel on the site of the ancient refectory. Here the site has an enduring sentiment attached to it, and it is approached by the west walk of the cloisters, between which and the Abbey itself most people, certainly, hardly make distinction in point of veneration. But the proposal for an additional north aisle is the one of all these that certainly best satisfies the requirement of close association and incorporation with the Abbey. It would undoubtedly be an integral part of the Abbey, but the interference with the structure that such a plan would involve would appear, and ought to appear, to most persons too serious to permit of its adoption.

It is clear, therefore, that to find a site for the new building would be most difficult, and this fact is attested by the inconclusiveness of the Commissioners' report. Indeed, it seems that wherever a new building is to be placed it must still be a new building; and for that reason alone for generations to come, as well as for many other reasons, a distinct building.

It is difficult to say how deeply the element of time enters into the estimation of the honour of burial in Westminster Abbey; but it is pretty certain that if this element were removed, the esteem would be in danger of going also. It is as impossible in the present day to create such a sentiment as to create a custom, and we may well fear that the sentiment that has grown up around the Abbey by time would not extend itself to any new building.

It seems, however, that the previous history of the Abbey guides us in the present case to the action that we should take. For memorial in the Abbey at first the eastern part was taken up; but gradually, as the necessity arose, the memorials and graves were taken further westward, and to the various chapels—parts less traditionally sacred being of necessity gradually occupied—until practically the whole church has been covered, and the sentiment which first attached itself to the eastern part of the church has equally extended to all parts. Should we not continue this process of gradual extension now at this stage also if we can? We have covered all the parts of the Abbey traditionally most prized, but there certainly yet remains room for a very long time for memorials (a suggestion put forward first by Mr. KNOWLES) in the cloisters. The wall-space is indeed ample for monuments for much longer than we need be at pains to provide for. Already there are in them certain monuments of much antiquity, and if we say that these are mainly to persons of minor interest, we must remember that the Abbey itself contains many monuments to persons certainly of no greater eminence or importance. From the point of view of architecture the cloisters were once among the most beautiful parts of the Abbey, and might again be restored to much beauty, greatly as they have fallen.

But principally to the cloisters are attached all the venerable associations and reverential feelings with which the Abbey is regarded, and which enter so largely into the causes of the esteem in which burial in the Abbey is held. Who, having the right of choice, would not prefer a grave under the green turf of the cloister garth, hallowed by the memories of centuries, to an interment in some new monumental chapel, however magnificent or however ingeniously fitted on to the old Abbey?

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

GRAY'S JOURNEY TO ITALY.

A SCHOLAR'S life is supposed by many people to be one of luxury. The world and its cares do not trouble him, for he hears of them as if they were abstractions. All things human appear to him not as they are in reality, but as literary subjects that are prepared in a way that may afford him a refined pleasure. Like one of the Olympian gods, he can

Smile in secret, looking over wasted lands,
Blight and famine, plague and earthquake, roaring deeps and fiery
sands,
Clanging fights and flaming towns, and sinking ships and praying
hands.

The necessity to provide food and raiment and a shelter checks many from indulging in the luxury of treating life as an affair of books; but there are men who, without being wealthy, are enabled by the agency of the founders of colleges and communities to enjoy themselves throughout their lives in that way. The author of the "Elegy written in a Country Churchyard" was one of those lucky men who are able to regard the world as a spectacle that was arranged for their entertainment. He was the son of an indolent father, who according to one account was a merchant, while others say he was a sort of money-lender. In the son the indolence assumed the form of an elegant epicureanism. Thomas Gray was placed under the care of a relative, who was a master at Eton. In that school he made friends of Horace Walpole, who was a kindred spirit, and Richard West, who might have gained distinction as a lawyer if he cared for the drudgery. The three boys seem to have had one quality in common—a fastidiousness which kept them from mingling with the rest of the scholars.

From Eton Gray passed to Cambridge, which was to be his home for life. It was characteristic of him that he considered he was superior to the dons and students of Peterhouse. "I do not know one of the people all around me," he wrote, "who inspires me with any ambition of being-like him." That sort of feeling compelled him to isolation, which had the advantage of enabling him to study his books more closely. Apparently he cared only for the classics, and was indifferent to mathematics. His friend Horace Walpole obtained the appointment of Inspector-General of the Exports and Imports, which he soon changed for the Ushership of the Exchequer. Those mysterious offices were not bars to reposing on a bench in the House of Commons, and Sir Robert Walpole considered his son could vote on a division as well as an older place-holder. But Horace did not care for Parliamentary toil. He prevailed on his father to allow him to make the Grand Tour, and Gray was invited to be his companion. In that way Gray's travels were undertaken. At the time (1739) he was about twenty-three. Horace Walpole was a few months younger.

We suppose the pair might be accepted as types of the highest class of young amateurs of that age. Horace Walpole subsequently devoted himself, as Macaulay says, "to decorate a grotesque house with piecrust battlements, to procure rare engravings and antique chimney-boards, to match old gauntlets, to lay out a maze of walks within five acres of ground" as the grave employments of his life. Gray was accepted as an authority on "painting, prints, architecture and gardening," a phrase that may have been in the late Mr. Ayrton's mind when he declared his indifference to architects and market gardeners. The "Elegy," which is accepted as his best work, suggests the character which scholarship had imparted to his mind. It has been described by critics as a piece of mosaic, but it would be more exact to say it was a mosaic that was made up with a great many which, if small, were complete. There never was a poem of the length which presents so many complete pictorial suggestions. It might be "cut out in little stars," as Juliet would have Romeo, and each would be perfect. This quality of mind is found in Gray's account of what he sees. He was not able to grasp a whole either in nature or art, and prefers to dwell upon details. That kind of vision has its use; but Gray was, like many of his contemporaries, of a supercilious turn, or, as he was described by an admirer, was curious, pensive and philosophical, and it was difficult to find any building that satisfied him.

Following the usual route from Calais to Paris, in April, 1739, he soon reached Amiens. The cathedral appeared to him as "a huge Gothic building beset on the outside with thousands of small statues, and within adorned with beautiful painted windows, and a vast number of chapels dressed out in all their finery of altar-pieces, embroidery, gilding and marble." There is not much which is characteristic of Amiens Cathedral in the description, but more remarkable is the failure of the building with the exception of the painted windows to make much impression on him. In a letter to a friend he sums up his experience of Amiens by saying, "At Amiens we saw the fine cathedral and eat *paté de perdrix*," which any unpoetic Englishman could do as well. The next place which detained him was St. Denis. It would be interesting to have a description of the church as it appeared fifty years before the devastation by the Revolutionists, but Gray's peculiarities hindered him from seeing more than the treasures which used to captivate the least instructed tourists:—

"At St. Denis, saw all the beautiful monuments of the kings of France and the vast treasures of the abbey, rubies and emeralds as big as small eggs, crucifixes and vows [votive offerings], crowns and reliquaries of inestimable value; but of all their curiosities the thing the most to our tastes, and which they, indeed, do the justice to esteem the glory of their collection, was a vase of an entire onyx, measuring at least 5 inches over, 3 inches deep, and of great thickness. It is at least two thousand years old; the beauty of the stone and sculpture upon it (representing the mysteries of Bacchus) beyond expression admirable. We have dreamed of it ever since.

It may be said in excuse that Gray, from his devotion to the classics, found a difficulty in understanding the Gothic principle, and that he could hardly help following the precedents of many fine gentlemen, who believed that Mediæval churches

were signs of the barbarism of the builders. But what is to be said about his manner of appreciating Versailles? In 1739 the palace was unlike what it is now, with masonry that is crumbling. Not more than twenty-four years had elapsed since Louis XIV. had departed from it and France, and the place must have preserved its original character as a pleasure-house. Yet Gray could discover few things in the palace or gardens to satisfy him. In writing an account of his visit to his friend West he said:—

Well! and is this the great front of Versailles? What a huge heap of littleness! It is composed, as it were, of three courts, all open to the eye at once, and gradually diminishing till you come to the royal apartments, which on this side present but half a dozen windows and a balcony. This last is all that can be called a front, for the rest is only great wings. The hue of all this mass is black, dirty red and yellow; the first proceeding from stone, changed by age, the second from a mixture of brick, and the last from a profusion of tarnished gilding. You cannot see a more disagreeable *tout ensemble*; and, to finish the matter, it is all stuck over in many places with small busts of a tawny hue between every two windows. We pass through this to go into the garden, and here the case is indeed altered: nothing can be vaster and more magnificent than the back front; before it a very spacious terrace spreads itself adorned with two large basins; these are bordered and lined (as most of the others) with white marble, with handsome statues of bronze reclined on their edges. From hence you descend a huge flight of steps into a large semicircle formed by woods that are cut all round into niches, which are filled with beautiful copies of all the famous antique statues in white marble. Just in the midst is the basin of Latona; she and her children are standing on the top of a rock in the middle, on the sides of which are the peasants, some half, some totally changed into frogs, all which throw out water at her in great plenty. From this place runs on the great alley, which brings you into a complete round, where is the basin of Apollo, the biggest in the gardens. He is rising in his car out of the water, surrounded by nymphs and tritons, all of bronze and finely executed; and these, as they play, raise a perfect storm about him. Beyond this is the great canal, a prodigious, long piece of water, that terminates the whole; all this you have at one *coup d'œil* on entering the garden, which is truly great. I cannot say as much of the general taste of the place. Everything you behold savours too much of art; all is forced, all is constrained about you; statues and vases sowed everywhere without distinction; sugar-loaves and minced-pies of yew, scrawl-work of box, and little squirting jets-d'eau; besides, a great sameness in the walks cannot help striking one at first sight, not to mention the silliest of labyrinths, and all Æsop's fables in water.

Having exhausted Paris, Gray and Walpole turned towards Italy. Gray's description of the cathedral of Rheims nearly corresponds with what he said about Amiens:—"A vast Gothic building of a surprising beauty and lightness, all covered over with a profusion of little statues and other ornaments." Lyons he considered to be "the dimmest place in the world;" Geneva appeared to him as "very small, neat, prettily built and extremely populous." The Palace of Turin he described as "the very quintessence of gilding and looking-glass; inlaid floors, carved panels, and paintings wherever they could stick a brush." He expressed disappointment that after his six months' search on the Continent he had not "anywhere met with those grand and simple works of art that are to amaze one, and whose sight one is the better for." Genoa was the first place in which he realised the charm which Italy can exert on susceptible strangers, and a week's stay appeared to him as far too short. He gave the following account of the Palazzo Doria:—

I should make you sick of marble if I told you how it was lavished here upon the porticoes, the balustrades, the terraces, the lowest of which extends quite to the sea. The inside is by no means answerable to the outward magnificence; the furniture seems to be as old as the founder of the family [Andre Doria]. The great embossed silver tables tell you, in bas-relief, his victories at sea; how he entertained the Emperor Charles, and how he refused the sovereignty of the Commonwealth when it was offered him; the rest is old-fashioned velvet chairs and Gothic tapestry. The rest of the day has been spent, much to our hearts' content, in cursing French music and architecture, and in singing the praises of Italy.

Rome was reached by the travellers a year after their departure from London. They were not disappointed in their anticipations. In a letter to his mother Gray explains the effect which a sight of the city produced within him:—

The first entrance of Rome is prodigiously striking. It is by a noble gate, designed by Michel Angelo, and adorned with statues; this brings you into a large square, in the midst of which is a vast obelisk of granite, and in front you have at one view two churches of a handsome architecture, and so much alike that they are called the twins; with three streets, the middlemost of which is one of the longest in Rome. As high as my expectation was raised, I confess the magnificence of this city infinitely surpasses it. You cannot pass along a street but you have views of some palace, or church, or square, or fountain, the most picturesque and noble one can imagine. We have not yet set about considering its beauties, ancient and modern, with attention, but have already taken a slight transient view of some of the most remarkable. St. Peter's I saw the day after we arrived, and was struck dumb with wonder. I have hardly philosophy enough to see the infinity of fine things that are here daily in the power of anybody that has money, without regretting the want of it; but custom has the power of making things easy to one.

Among the most interesting of Gray's letters is one to his friend West, in which he writes partly as an antique Roman and partly as Thomas Gray. He was growing happier, for he was on ground which had become familiar through books. Writing in May 1740, he says:—

Rome: May 1740.

I am to-day just returned from Alba, a good deal fatigued, for you know the Appian is somewhat tiresome. We dined at Pompey's; he, indeed, was gone for a few days to his Tusculan, but by the care of his Villicus we made an admirable meal. We had the dugs of a pregnant sow, a peacock, a dish of thrushes, a noble scarus just fresh from the Tyrrhene, and some conchyliæ of the lake with garum sauce. For my part I never eat better at Lucullus's table. We drank half a dozen cyathi a-piece of ancient Alban, to Pholœ's health, and after bathing and playing an hour at ball, we mounted our essedum again and proceeded up the mount to the temple. The priests there entertained us with an account of a wonderful shower of birds' eggs that had fallen two days before, which had no sooner touched the ground but they were converted into gudgeons; as also that the night past a dreadful voice had been heard out of the Adytum, which spoke Greek during a full half-hour, but nobody understood it. But quitting my Romanities, to your great joy and mine, let me tell you in plain English that we come from Albano. The present town lies within the enclosure of Pompey's Villa in ruins. The Appian Way runs through it, by the side of which, a little further, is a large old tomb, with five pyramids upon it, which the learned suppose to be the burying-place of the family, because they do not know whose it can be else. But the vulgar assure you it is the sepulchre of the Curiatii, and by that name (such is their power) it goes. One drives to Castel Gandolfo, a house of the Pope's, situated on the top of one of the Collinette, that forms a brim to the basin commonly called the Alban Lake. It is seven miles round, and directly opposite to you, on the other side, rises the Mons Albanus, much taller than the rest, along whose side are still discoverable (not to common eyes) certain little ruins of the old Alba Longa. They had need be very little, as having been nothing but ruins ever since the days of Tullus Hostilius. On its top is a house of the Constable Colonna's, where stood the temple of Jupiter Latiaris. At the foot of the hill Gandolfo are the famous outlets of the lake, built with hewn stone, a mile and a quarter underground. Livy, you know, amply informs us of the foolish occasion of this expense, and gives me this opportunity of displaying all my erudition, that I may appear considerable in your eyes. This is the prospect from one window of the palace. From another you have the whole Campagna, the city, Antium and the Tyrrhene Sea (twelve miles distant), so distinguishable that you may see the vessels sailing upon it. All this is charming. Mr. Walpole says *our memory sees more than our eyes in this country*, which is extremely true, since for realities Windsor or Richmond Hill is infinitely preferable to Albano or Frascati. I am now at home and going to the window to tell you it is the most beautiful of Italian nights, which, in truth, are but just begun, so backward has the spring been here and everywhere else, they say. There is a moon; there are stars for you! Do not you hear the fountain? Do not you smell the orange-flowers? That building yonder is the convent of St. Isidore, and that eminence with the cypress trees and pines upon it the top of Mount Quirinal. This is all true, and yet my prospect is not 200 yards in length.

The systematic excavation of Pompeii was not commenced until several years afterwards. But in 1738 an attempt was made to explore the other buried city, Herculaneum. Gray was in Naples in June 1740, and he was permitted to witness the operations. His account of the ruins is probably the first that was printed in English:—

About a year ago, as they were digging, they discovered

some parts of ancient buildings above 30 feet deep in the ground; curiosity led them on, and they have been digging ever since. The passage they have made, with all its turnings and windings, is now more than a mile long. As you walk, you see parts of an amphitheatre, many houses adorned with marble columns and encrusted with the same, the front of a temple, and several arched vaults of rooms painted in fresco. Some pieces of painting have been taken out from hence, finer than anything of the kind before discovered, and with these the king has adorned his palace; also a number of statues, medals and gems; and more are dug out every day. This is known to be a Roman town that in the Emperor Titus's time was overwhelmed by a furious eruption of Mount Vesuvius, which is hard by. The wood and beams remain so perfect that you may see the grain, but burnt to a coal, and dropping into dust upon the least touch. We were to-day at the foot of that mountain, which at present only smokes a little, where we saw the materials that fed the stream of fire which about four years since ran down its side.

Gray remained in Italy until the summer of 1741. He was disappointed with his progress in Italian and other linguistic subjects. Walpole also had disappointments. Disagreements arose, and they separated at Reggio. Four years afterwards there was a reconciliation, but they never proposed a renewal of their travels in classic lands. Gray subsequently endeavoured to study the remains of Mediæval architecture in England, and it was no easy task, for there were no trustworthy books to help him. His friends and admirers believed he had mastered the subject, and he was at least competent to rebuke another poet, who declared that the ruins of Persepolis were in the Gothic manner; but one doubts Gray's judgment when he declared that Walpole's Strawberry Hill had a purity of Gothicism in it not to be seen elsewhere. Gray's few contributions to literature have, however, merit enough to compel critics to forgive his want of judgment in archæology.

STOCK PRIZE, 1893.

THE Council or the Society of Arts are prepared to offer, under the terms of the Stock Trust, a gold medal, or a prize of 20*l.*, for competition amongst the students of the Schools of Art of the United Kingdom, at the annual competition held in 1893. The prize is offered for the best original designs for an architectural decoration, to be carried out in any or all of the following processes, *e.g.*, painting, stucco, carving, mosaic, or any other process. This architectural decoration is to be either for the side of a room or a hall, a ceiling, or the apse or side of the chancel of a church, or any suitable part of the interior of a building.

The designs must be on imperial sheets. Each set must consist at least of a coloured drawing to scale of the whole design of decoration, and two coloured drawings of details on separate imperial sheets. Mere patterns or sketches of details, without the mouldings or borders necessary to make up a complete decorative scheme, will not be taken into consideration. The designs must have been made during the previous school year.

The designs are to be submitted, with other school work, in the usual manner, to the Department of Science and Art, in April, 1893. Each of the imperial sheets forming a set of competing designs must be marked "In competition for the Stock Prize," in addition to being labelled or staged according to the regulations of the Department of Science and Art.

MULREADY PRIZE, 1893.

THE Council of the Society of Arts are prepared to offer, under the terms of the Mulready Trust, a gold medal, or a prize of 20*l.*, for competition amongst students of the Schools of Art of the United Kingdom, at the annual national competition held in 1893. The prize is offered to the student who obtains the highest awards in the following subjects:—(a) A finished drawing of imperial size from the nude living model. (b) A set of time studies from the nude living model (mounted on imperial size mounts). (c) A set of studies of hands and feet from the living model (mounted on imperial size mounts). (d) Drawing from the life done at the examination on May 11, 1893.

No student will be eligible for the award who does not pass in the examination (d) in drawing from the life, and who does not obtain an award for (a) the finished drawing of imperial size from the nude living model. The other two subjects are optional. The works must be those of the previous school year.

The drawings, &c., are to be submitted, with other school works, in the usual manner, to the Department of Science and Art, in April, 1893. Each competing drawing must be marked "In competition for the Mulready Prize," in addition to being labelled according to the regulations of the Department of Science and Art.

PRESENTATION TO AN ARCHITECT.

THE new baths in Stafford have been erected from designs by Mr. George Wormal. As that gentleman is a member of the Baths Committee of the Corporation, he could not receive any fee for his services. A testimonial was therefore subscribed, and was presented to Mr. Wormal on Thursday in last week. It may be stated, says the *Staffordshire Advertiser*, that the committee who have had the matter in hand were the deputation who, as delegates from a town's meeting, waited upon the Baths Committee with suggestions for the improvement of the exterior designs of the baths from the picturesque and ornamental point of view. The testimonial consisted of a solid silver tea and coffee service, of Queen Anne pattern. The Mayor said their object in meeting together was to show their appreciation of a gentleman who had given a considerable amount of time and trouble, besides exercising his skill and ability, upon a work for which he was not under the circumstances able to send in a bill. The work had been done for the benefit of Stafford and neighbourhood, and it would have been most ungrateful if his services had not been in any way recognised. He was pleased to say that they had been recognised to some extent, and he was sure they would all heartily agree with him that Mr. Wormal was fully entitled to such recognition. Mr. Matthews, the chairman of the Baths Committee, made the presentation. He recalled the circumstances under which Mr. Wormal, who was a member of the committee, came to their assistance for the improvement of the elevation, both with respect to the street and the river front. He said he heard almost daily, both from townspeople and from strangers, some expression of appreciation of the value of the work done by the borough surveyor in connection with the interior, and of the beauty of Mr. Wormal's elevation, and he congratulated Mr. Wormal on the spontaneity of the movement for the recognition by his fellow-townsmen of the handsome manner in which he came to the front and placed his professional skill at the service of the committee. He also congratulated Mr. Wormal on the fact that the baths were not the only specimen of his skill, but that throughout the whole length of their grand old street there were monuments of his creation in the form of brick and mortar which would long remain to bear witness to his professional ability. He concluded by formally asking Mr. Wormal's acceptance of the tea and coffee service, with a parchment roll containing the names of the subscribers. Mr. Wormal, in reply, expressed his warmest thanks for the kindness shown to him by the presentation. He explained that he did not in any way offer his services, but was asked by the deputation who waited upon the Baths Committee for the improvement of the site if he would assist the borough surveyor in preparing a sketch of the exterior. He eventually undertook the sketch himself, but he did not anticipate at that time that he should be called upon to provide the working drawings and other things as well while the work went on. That, however, he found to be necessary in order to convey his ideas properly with respect to the work. His only regret was that the whole of his plan had not been carried out, comprising, as it did, a design for the fire station. The consequence was that the building had been left rather bald from that aspect, but he trusted that some time the Fire Brigade would be provided with a better station and the design completed. That would greatly improve the entrance to the Backwalls, which might possibly some day develop into a good street, as there was a lot of property in the Backwalls belonging to the Corporation, the lease of which had not many years to run. The proceedings terminated with a vote of thanks to the Mayor for presiding.

ST. GEORGE'S HALL, LIVERPOOL.

IN 1836, before their tastes found expression in the Philharmonic Society (says the *Liverpool Post*), the good people of Liverpool were ardent in the support of the Liverpool triennial musical festival, which was held—these being the best conditions then obtainable—in St. Peter's Church. Since, however, the festival was a success, there was a general feeling that it should take place for the future in a building appropriate to, and built for the purpose, and so pronounced was the desire that when a public subscription was opened with this object some £23,350 was subscribed within a limited period. For a great town Liverpool was then somewhat remarkable in having no important place of public assembly. The Town Hall, un-

like other and more modern Town Halls, was, in point of fact, a mansion house, admirable and elegant in its appointments, reflecting, as it still reflects, the commercial opulence of the port, but for holding great public meetings and musical festivals wholly unsuitable. But the Town Hall was at that date the only public building of importance, for whilst Liverpool had greatly prospered, and its merchants had built themselves many fine houses, there was still about the city a certain *publique egestas*, due, doubtless, for the most part to the rapid and; it must be confessed, unforeseen growth of the place. Under these circumstances, it is not surprising that the feeling in favour of a further adornment of the city, especially when that adornment also met a public want, was strong and widespread. The Corporation and townsmen of that date were not unlike, indeed, the *nouveau riche* who, finding himself with his pocket full of cash, has a desire, in its way laudable enough, to express his importance in a permanent form. The project for building a new concert hall was taken up warmly, and a public competition was opened among the architects of the country. For the carrying out of so large a work the competition was naturally keen; the sets of plans sent in numbered seventy-five; and the choice of the committee fell upon Mr. Harvey Lonsdale Elmes, a youthful architect, who had just entered upon his professional career in London.

Mr. Elmes, whose genius at the age of twenty-five thus triumphed so signally over the experience and attainments of so many older compeers, was the son of Mr. James Elmes, surveyor of the port of London. In conjunction with Haydon, the latter had compiled a dictionary of the fine arts, and was known as a man of superior taste and ability. But the son possessed not ability merely. Young as he was, he had mastered Greek and Roman architecture down to their minutest details, and, well knowing, as he himself expressed it, that Greek architecture, to be seen in its true beauty, must be executed in Greek marbles and have a Greek atmosphere and climate, he yet conceived that English architects, by studying nature, and boldly throwing aside the trammels of a false classicism, always tending to degradation, might produce a graceful architecture native to our climate, materials, and national character. It is said that he studied his great designs down to the smallest particulars of ornament, drawing the details over and over again, until the proportions were harmonised and perfectly balanced. The truth of this is evident in his work, for if there is one great merit in the design of St. George's Hall, it is the faultless harmony of the proportions.

The plans for the new concert hall were original and bold, but the Corporation discovered about the same time that they needed new law courts, for Liverpool had recently been made the assize town for South Lancashire, and the old courts on the west side of the Exchange were to the last degree out of date and inconvenient. Again there was a public competition as to designs, and again, among eighty-six competitors, Elmes carried off the award. Just at this juncture, as it would happen, the project for the erection of a concert hall hung fire. The first ardour of the scheme was now over, and the committee wanted more money than they had in hand. Under the circumstances, it was wisely arranged between them and the Corporation that the concert hall and law courts should be combined into one building. With this object, the two sets of Elmes's plans were put into the hands of the Corporation surveyor, to produce from them some kind of composite scheme embodying the idea in view. Naturally Elmes demanded that he ought to do the combining himself. Strange as it may appear, the demand was resisted; but the surveyor, happily, was "the soul of honour," supported his professional brother against the Finance Committee, and carried his point. The Corporation were thus saved from perpetrating a flagitious injustice. These preliminaries adjusted, the youthful architect proceeded with his work, the result of which was St. George's Hall, which, although modified in some particulars during its construction, is in every substantial detail as he designed it. The site for the building, the grounds of the old infirmary in Lime Street, is one of the finest and most commanding that could be desired. In those days, however, it consisted of unsightly rubbish heaps, and the erection of the hall was begun not to adorn an imposing thoroughfare as Lime Street is now, but among mean buildings and vacant plots. It is the result of the work that it has gained in architectural interest with every addition to its surroundings, and there is every probability—nay, almost a certainty—that in the richer and more elegant Liverpool yet to come it will be a still finer "ornament to the municipality" than it is even at the present time.

It is not proposed to enter here into the difficulties and discouragements which Elmes had to face in carrying out his plans. He had for his personal friend as well as coadjutor in the work Mr. Robert Rawlinson, assistant surveyor of the Corporation, an able man, deserving to be remembered as the author of the Bala Lake water scheme, an undertaking strictly analogous to the Vyrnwy, and one which its author saw to be absolutely necessary, although it was rejected in favour of the less far-seeing Rivington enterprise. These difficulties, these

discouragements, these contests with committees and conflicts with rumours that the immense building would not stand, combined with undeserving ridicule, are recorded in the architect's own letters, which Rawlinson afterwards printed for private circulation. One instance will be sufficient. The roof of the great hall is a brick arch, 18 inches thick, and 80 feet in span, built with hollow bricks, which reduce the weight by half. This daring piece of building construction fairly frightened most people. The Press gave currency to rumours that whilst building it had collapsed or would collapse; but the wish was father to the thought, for the designer and his supporters knew its strength and smiled at fears. The building was begun in 1842, Elmes and Rawlinson lunching on the ground on bread and cheese on the first day with the horde of navvies who were employed upon the foundations. The work of construction occupied over twelve years; but on September 12, 1854, the hall was formally opened by Mr. J. B. Lloyd, mayor. In 1851 it was visited by the Queen and Prince Consort, but was still incomplete.

The original estimate for the cost of St. George's Hall was 153,000*l.*, but the building was put up in so solid and durable a manner that the actual cost far exceeded that amount. The architect himself exercised whilst able a lynx-eyed supervision, and anyone who examines the masonry critically will observe that it is put together with great exactness, almost calculated, like the public buildings of the Greeks and Romans, to stand without cement. It is curious to hear the youthful architect complaining four years after the building was undertaken, and when the sub-structure was scarcely finished, of "bad bricks, bad work and bad workmen." These were the reasons he assigned for slow progress, but the more probable truth is that he was himself impatient.

The late Sir James Picton, among others, took serious exception to the design of the hall in some particulars, but chiefly because of the inadequate character of the entrances. The door under the south portico, for example, is apparently of noble proportions, but it is a huge architectural sham. The hall into which it opens is in truth not more than half its height; the great bronze gates are immovable, and the only means of ingress and egress is a "low-browed wicket," which gives access to a dark vestibule, which in turn leads to tortuous passages. Again, the late architect and antiquary thought it a defect that the entrances to the great hall from the east portico passed through a corridor not more than 12 feet high; that the entrance to the hall should not have been from one end, that it might burst at an instant on to the view; and that the doors leading to the north vestibule were no bigger than ordinary house doors. Again, he took exception to the windows in the west front as destroying the monumental character of the building from that side, and objected to the square pillars as heavy-looking. After a little reflection, however, these objections become more apparent than real. The doors under the east portico are in the shadow, and do not form a feature of the façade. Moreover, they are not unimposing or dwarfed, for the doors in buildings of Greek and Roman architecture were never great yawning openings like those in Gothic cathedrals. In this respect Elmes kept to the traditions of ancient art as well as to the necessities of the case, for a high entrance from the east must have wholly spoiled the interior. Beyond this, anyone who studies the west front from a point of view of some vantage, say the plateau in William Brown Street, cannot fail to be struck with the perfect balance of the parts. The front is plain, and the lines, though severe, are chaste and effective. The massive character of the pillars is in keeping with the whole, and the windows decidedly heighten the effect.

Severely critical as he was—perhaps too much so—Sir James Picton could not help admiring the admirable Classic taste of the ornament and details of the building. In truth these recall the best periods of Greek art, and show great knowledge and judgment as well as intellectual force. The recessed galleries in the east front were a novel design, but very striking and effective. It should not be forgotten that St. George's Hall is still incomplete. With two exceptions, the ten panels designed for sculpture are still rough unhewn stone, and the fifteen pedestals for statuary between the square pillars beneath the portico and elsewhere are still, with one exception, empty. Were these adornments but complete, we should have a number of fine and graceful lines, harmonising with the beautiful but severe lines of the architecture, and affording objects of pleasure and attraction to the eye, which would make the St. George's Hall at once a public education in taste and a monument of that love for the liberal arts which is the most permanent honour of a community.

Without reviving a bitter controversy which arose as to the position of the great organ, it is interesting to note that one of the most cherished ideas of the architect was a vista through the hall from one of the law courts into the other. In one of his letters he wrote:—"I suppose you to stand on the judge's platform in one court. Your eye, glancing along the ranges of ruddy columns on either hand, in all the richness and strong colour of a foreground, reposes for an instant on the lofty

arched opening connecting with the hall, whose broad and coloured soffit throws a shade upon the grey columns beneath, and forms the middle distance. It pierces the atmosphere of the great hall, passes the corresponding opening into the other court, and, without distinguishing a particle of the detail, from the great distance, finally rests upon the further judge's throne." This "magnificent distance" left out of account the organ, and remained in consequence but a splendid vision.

It needs but to add that Elmes, breaking in health through his arduous labours, undertook a voyage to the West Indies, accompanied by his young wife and an infant daughter. He died abroad whilst still under thirty, and when St. George's Hall was not nearly complete. Liverpool is to be congratulated upon having the most important example of the work of this distinguished architect.

ST. MARY'S CHURCH, OXFORD.

THE Secretary of the Society for the Protection of Ancient Buildings has replied to Mr. T. G. Jackson, A.R.A. He says:—

Assuming that Mr. Jackson has been correctly informed, the fact that two of the existing statues are modern, and that they are not recognisable as such from below, goes far to confirm the statement in my letter. Whatever may be the case nearer the ground, I did not deny that at such a height spurious antiquities would eventually mislead the public. On the contrary, I affirmed this, and I only differ from Mr. Jackson as to the advantage of such deception. In the matter of classical texts good scholars have determined that conjectural restoration is undesirable, and that it is better to leave a gap in a Greek chorus than to attempt to supply the missing lines. The time is approaching when this principle will be more widely accepted. It will be applied with as little question to decorative features in architecture as it is already applied to paintings and isolated pieces of sculpture. If, after every effort, it should prove impossible to secure the unruly members described by Mr. Jackson, and to brace up all that remains of the ancient figures, two alternatives may be considered. The first is to remove the statues and to leave their places untenanted, which Mr. Jackson declines to do. The second is to carve statues which, being frankly modern, can never be mistaken for the productions of another century than our own. Either course would be more honourable to the University, and to the memory of the master-builders who raised and adorned the spire, than that which Mr. Jackson has advised.

LIBRARY ARCHITECTURE.

THE American Library Association is preparing an exhibit for the World's Columbian Exhibition at Chicago, under the auspices of the United States Bureau of Education. A prominent position in the exhibit is to be assigned to library architecture. The purpose of this department will be twofold. On the popular side it will serve to call public attention to the architectural importance and significance of libraries, and to suggest to communities and to individuals the erection of library buildings. For this purpose large and effective exterior views or models are particularly desired. On the professional and technical side it is intended to show the development and present state of library science as regards the adaptation of the building and its equipment to the practical purposes of a library. In this direction more importance attaches to floor-plans, sections and interior details than to exteriors.

Trustees, librarians and architects are invited to send for exhibition drawings or photographs of existing or proposed library buildings or rooms, whether built for the purpose or altered from premises intended for other use. While it is earnestly desired that the large modern libraries should send full sets of plans, it is equally to be hoped that the older and smaller libraries will contribute, for most of the libraries of the future which will derive benefit from this exhibit will be of moderate size and means. Librarians and trustees are asked to send, with their plans, suggestions as to merits or defects which have been developed in use. Architects who are preparing plans for library buildings, or who have submitted plans in recent competitions, are invited and urged to send them for exhibition, inasmuch as any carefully matured plan, even if not adopted, may contain features of practical interest to librarians.

If plans are prepared expressly for this exhibition, it is recommended that they be made on a scale of one-eighth of an inch to the foot, and rendered with India ink. The largest frames on which the plans are to be displayed will be 28 inches high by 40 inches wide, so that plans should not exceed that size. Many of the frames will be only 22 by 28 inches, and this size of plan is preferred by the Bureau of Education. The plans and models contributed will be arranged and displayed

as effectively as the available space will permit. After the Exhibition they are to form part of a permanent library exhibit. If the contributors are unwilling to part with their drawings for this purpose, it is hoped that photographic copies may be permitted.

The Library Association of the United Kingdom has promised thirty or more representative plans of English and Scotch library buildings, and if the American collection can be made thorough and representative, the combined exhibit will not only be very useful to those interested in library administration, but it may also serve to stimulate and encourage the building of libraries in all parts of the United States. Notification of willingness to send plans should be sent at once, and the plans should be forwarded (flat) as early as possible to C. C. Soule, 15½ Beacon Street, Boston, Mass.

ARCHITECTS' FEES.

AT the last meeting of the Stafford Board of Guardians a letter was received from Mr. G. Wormal, architect for the new hospital at the workhouse, with reference to the resolution passed at the last meeting of the Board offering to pay him 85% for the preliminary plans and 5 per cent. in respect to the adopted plans on the contract amount of 3,900*l.* Mr. Wormal said first, with respect to the work done in the abandoned scheme, his account of 115*l.* was prepared with care, and did not include many small matters which he was fully entitled to charge for. Up to the present moment, although the account had been before the Guardians for more than two months, no single item had been called in question. Their first offer he rejected, but offered in his turn, as a concession to sentiment, to reduce his account by 15*l.*, making it 100*l.*, and this amount he still held to, although it was not accepted. He was therefore compelled to decline 85% as settlement of his account. With regard to the second part of the resolution, in a work of this magnitude, variations of a slight character were bound to occur during the progress of the work which would have to be adjusted at completion, but he could assure the Guardians that no material addition or alteration would be made at his instance without consulting them first. He would suggest, therefore, that the commission be 5 per cent. on the actual cost, and not on 3,900*l.*, the contract amount. The Rev. E. C. Perry thought there was no doubt they would have to pay. Mr. Dodd was of the same opinion, but at the same time considered there had been neglect in not having a proper bargain. He moved that the charges be paid. Mr. Goodall thought it was right Mr. Wormal should be paid his charges, which no one had disputed. The Chairman said he had taken the opinion of several gentlemen whom he could rely upon, and they thought that the charges were somewhat too high, and that under the circumstances the architect should have conceded more than he had done. At the same time, it was pretty sure that they would be beaten if they carried the matter to a reference, and therefore he should support the resolution. Mr. W. Peach said it was the unanimous opinion of the business men who formed the committee that the charges were too high, especially in respect to those plans which were discarded. Major Johnson remarked that if the Guardians thought these charges were more than a country architect ought to make, in future they could dispense with his services. Mr. W. H. Peach asked if the building work was going on satisfactorily. He had heard remarks as to the material that was being used. Mr. Sampson said the Building Committee considered that some of the material was not up to the standard they could wish. The committee had only met once as a body, and he suggested that they should meet again and report to the next meeting of the Board. The Chairman thought it would be necessary to have an understanding that the 5 per cent. should be paid on a sum not exceeding 3,900*l.* In the result, the resolution was carried.

ENBORNE CHURCH, BERKSHIRE.

THERE are very few churches now left in Berkshire which have not been modernised by the hand of the restorer. One of the few so remaining, says a correspondent of the *Reading Mercury*, is Enborne, near Newbury, a long, low, quaint little church with a very small wooden bell turret. Inside it is filled with high deal pews, too narrow and hard to be comfortable. But the church possesses many points of interest for the antiquary. Two years ago I visited and examined it. The chancel had been restored, the whitewash removed, and one fairly discernible fresco (the Annunciation) brought to light; probably one of a series, the rest of which are no longer visible. Open choir-stalls had been added. The piscina is double arched and behind, within the recess, is a hollow in the wall, probably the aumbry. The east window is poor, a later addition. The nave had once two aisles; of these only the southern now remains, with its fine Norman

arches and pillars; the corresponding ones on the opposite side are yet remaining, but are built up in the northern wall. These are, in the proposed restoration, to be uncovered, and an aisle built, but the design contemplated externally is scarcely Norman, nor is it likely to improve the appearance of the church, for it will hide the very high-pitched roof and tend to dwarf the church as seen from the lych gate.

The southern wall had to be rebuilt some years ago: it was being re-pinned, but was in such a bad condition that it fell down, nearly killing the workman engaged upon it. A very perfect fresco was lost upon this wall, but I did not ascertain what subject it represented. The wall had been undermined with vaults, which made it unsafe and caused its destruction. I fear the western portion is also in a bad condition. The timbers supporting the turret are eaten away, and like tinder, and the whitewash peeling off with damp is exposing to view the well-known red-brown colour of another fresco.

There are very few memorial stones within the church, none older than the last century; the oldest is dated 1734, to the memory of the Rev. Mr. Dashwood. Another rector, the Rev. Henry Craven, is commemorated by a very handsome dark marble vault stone, ornamented with the coat-of-arms and crest. There is also a tablet to the Rev. N. Lloyd, 1789, and two others to the Bunbury family, who owned Marlstone House. In the nave is a vault stone to John Richens, of Newbury, 1731; also a large vault stone; but this last is so hidden beneath the pew floor that neither name nor date is visible. The churchyard is very full; but the stones are so neglected and overgrown with orange lichen that many inscriptions have perished and become illegible, though with care they might be discovered and restored. The quaint little grinding organ was probably once considered good. It is by Bevington. This, of course, will be ousted by an organ or harmonium, and the familiar tunes of the old grinder will also disappear, though the change will doubtless not be regretted by anyone.

Enborne is interesting as having been a centre of the warfare between King Charles and his parliament. Near here the troops met in battle, and there probably many of the slain soldiers were buried, although in many instances such burials took place on the parish boundaries nearest to the field of battle. To this day relics of the fight are constantly being found—cannon balls, bullets, or accoutrements. It was in this quiet little parish that two battles of the Civil War took place.

The church plate consists of a tall cup dated 1663, but its plate mark is of the year 1633, when it was made, although not perhaps presented to the parish until after the war. A thin paten, very much worn, has four silver marks; its date letter is 1679. The rest of the plate is of this century, namely, a large paten or plate, 1801, and a modern alms-plate, 1856, the gift of Mr. Valpy. Lysons gives but a brief account of the parish, which, he says, was divided into two manors, East Enborne and West Enborne, the latter known as Chéney. Apparently the two manors were united in the time of King Henry VIII.

The old clerk's notes of the parish registers are still preserved, loose parchment sheets stitched together dating from 1559 and, I think, ending with the Civil War time. These are in fair condition, though in some parts illegible. The later registers have been neatly transcribed by former rectors, and it would be a good thing if the old ones were also neatly transcribed.

LONDON IMPROVEMENTS.

THE Bill which has just been deposited in the Private Bill Office of the House of Commons by the London County Council, dealing exclusively with specific improvements, as distinguished from general improvements (which are embodied in another of their deposited Bills) contains forty-nine clauses, including the "betterment" clause, which after being rejected by Hybrid Committees of the House of Commons for two years is again introduced, but in a form which, in the event of its not receiving the sanction of Parliament, need not necessitate, as in previous years, the withdrawal of the contemplated improvements. As we have already stated, the most costly of the works under the powers of this Bill is the construction of the "New Central Street" from Southampton Row, Holborn, to the north side of the church of St. Mary-le-Strand, which improvement will include the removal of the southern side of Holywell Street, and the laying out of ten new but subsidiary streets running from the new main thoroughfare to points surrounded by the Strand and Holborn. The Bill does not contemplate any interference with either of the churches in the Strand, except the setting back of the railings surrounding St. Clement Danes. The gross cost of this improvement is estimated at 3,869,550*l.* The Bill also seeks power to enable the Council to make a new approach to the Tower Bridge by the widening of Bermondsey New Road and Church Row, and the laying out of a new road between those two thoroughfares. The gross cost of this improvement is estimated at 436,000*l.*

The proposed rebuilding of Vauxhall Bridge and the maintenance of a temporary bridge during the rebuilding, for which powers are also sought in this Bill, are estimated to cost 484,000*l.*; and the proposed new ferry across the Thames between Rotherhithe and Ratcliff, powers for which are also included, is estimated to absorb 443,000*l.* The remaining improvements to which Parliamentary sanction is sought by this Bill is the widening on the south side of the approach road to Woolwich Ferry, estimated to cost 3,000*l.*, and the widening of Wood Lane, Hammersmith, the gross cost of which is put down at 47,215*l.* With reference to this widening, the Bill expressly excludes it from the operation of the "betterment" clause. The rehousing of the working classes who will be displaced by the destruction of the new streets will bring the estimated gross cost of these improvements up to 5,327,765*l.*

Cottage Building.

SIR,—There are two improvements which I think might be made in cottages which would add greatly to the comfort of the inhabitants. First, as to heating. At the present time the upper rooms derive no benefit from the fires below. A medical man said to me some time ago, "People in cottages often say to me, 'Well, doctor, I am quite warm in bed and well wrapped up.'" "Yes," he said, "you may be, but at the same time you are breathing cold air and chilling your lungs at every breath." This is quite true, and a dry warm atmosphere is one of the chief things to be considered in case of illness, and indeed for keeping in good health. In small houses a fire in a bedroom is a great difficulty, as I know full well.

I would propose that the usual chimney-breast should be done away with, and that the chimney should consist of an iron pipe or sanitary earthenware pipe carried up from the lower room through the room above, so that it may radiate heat into both rooms; on either side I would build up a wing of brick-work projecting a brick and a half, and before this might be

placed wirework, as shown in the sketch, in the lower room. The pipe at the top of the bedroom would disappear in an ordinary chimney-stack, as drawn; a clear space would be left between the pipe and the wings for the heat to circulate. By this means the bedroom would always be kept dry over the kitchen, and would at all times be healthier and more comfortable than sleeping in a damp, cold atmosphere. The cost would be absolutely nothing extra in a new building. The fixing, length and material of the pipes are merely matters of detail. The pipe could be coloured stone-colour, like the funnels of steam yachts—or indeed any colour.

Again, why is all the roof-space to be shut up and not utilised? In a room of 10 feet square with an ordinary pitched roof, ceiled in the usual manner, there is a loss of 200 or 300 cubic feet of breathing space. I would propose that the flat ceiling should be given up and the rafters either underdrawn, match-boarded or covered with wire-wove material or linoleum. If there should be a necessity for a tie-beam in such small rooms, then a tie-beam 6 inches square, with a king-post in

the middle, both nicely moulded, would be, not an eyesore, but a pleasant feature in the room. In case of larger rooms, if it was desired to have all the roof-space free from tie-beams, a flat wall-plate 1 foot wide, consisting of two 2-inch planks with a half-inch boiler-plate, the lengths properly rivetted together, all bolted secure, would sustain a great lateral thrust from the rafters of the roof. The roof should have a layer of felt.

These suggestions, of course, are applicable to any house. In a country like this we want all the warmth, pure air and comfort we can get in our houses.

Whorlton Vicarage.

(Rev.) J. C. FOWLER.

Beauvais Cathedral.

SIR,—I observe in one of your "Notes" last week a reference to a work by M. Benouville on the cathedral of Beauvais. We can hardly have too many disquisitions on Mediæval building, but it ought not to be forgotten that M. Benouville is not the first who has attempted to discover the principles by which such a wonderful *tour de force* as we can see at Beauvais was produced. Need I remind your readers that the subject is treated in a masterly way in the "Dictionnaire raisonné de l'Architecture française"? Viollet-le-Duc considered that the cathedral (that is to say, the choir) was the very best exemplification of the building science of the thirteenth century. In it, he says, the architect went as far as he could to display what was feasible with stone. The accident is ascribed by Viollet-le-Duc to two causes—first, the defective workmanship of the men; secondly, the insufficiency of the materials. It might be said that the architect designed a remarkably economical church, and one which gave the fullest scope for processions and other ceremonials; but, as sometimes happens in England, either the clergy or the contractors for the masonry considered that the architect's margin of safety was excessive, and they carried his principles farther than he would attempt. To say, therefore, as is done in the guide-books, that there was a miscalculation on the part of the architect of Beauvais is not warranted. If M. Benouville will only succeed in persuading the compilers of such works to hesitate before they hazard explanations he will be doing a good work. It may be granted, however, as possible that the thirteenth-century designer was not sufficiently acquainted with the qualities of the building stones that were to be used, and, if so, the case would go to prove that the design was not prepared at Beauvais.—Yours truly,

F. S. A.

GENERAL.

The Demolition of the Hippodrome, Paris, is now in progress. The scheme to convert the immense building into a museum of machinery has therefore failed. The site will be used for mansions.

Mr. T. Chatfield Clarke has been appointed a justice of the peace for the Isle of Wight by the Lord Chancellor.

Mr. J. Charlton Parr, the late chairman of Parr's Banking Company, Warrington, has offered the town 5,000*l.* for the erection of a public hall in Warrington.

The Dundee Institute of Architects held their first ordinary meeting of the Institute for the session on Thursday evening, January 5, when a lecture was delivered on "Curiosities of Architecture in Dundee," by Mr. A. H. Millar, F.S.A. Scot., Dundee.

The Partnership formerly existing between Messrs. Keen & Drake has been dissolved. Mr. Keen retains the offices at 41 Bedford Row.

The Glasgow Corporation have accepted tenders for the erection of a new police station in Oxford Street, South Side.

The Manchester City Council have decided to make an application to the Local Government Board for power to borrow a sum of 150,000*l.* for the erection of the new Municipal Technical School and other purposes of the Technical Instruction Acts; 110,000*l.* will probably be the sum required for the building, but in addition there will be a considerable amount required for the equipment and fitting of the new school.

A Sub-Committee of the Glasgow Town Council, after long investigation, have reported against the adoption of overhead electric traction for tramways in that city. They recommend consideration of the cable system.

The Manchester Church Building Society, at the quarterly meeting on the 26th inst., will consider the following applications for grants:—Towards building a parsonage for St. Matthew's, Preston, at an outlay of 1,640*l.*; building a mission-room for the Albert Memorial parish, Manchester, at an outlay of 630*l.*; purchasing a parsonage for the parish of Christ Church, Patricroft, at an outlay of 1,305*l.*; building a mission-room for the parish of St. Peter's, Fleetwood, at an outlay of 1,110*l.*; and rebuilding Royton Church, Oldham, at an outlay of 6,792*l.*

The Architect.

THE WEEK.

It was wisely decided by the Commissioners of Sewers on Tuesday that Mr. H. H. BRIDGMAN's proposition for the improvement at the junction of Cheapside, St. Paul's Churchyard, Paternoster Row, Newgate Street, and St. Martin's-le-Grand should be considered. It appears that Colonel HAYWOOD, the engineer, recommended the scheme twenty-seven years ago. Everyone knows that the highway is far too limited to accommodate the combined traffic from north, south, east and west which meets there. It is calculated that 100,000 pedestrians and 30,000 vehicles pass every day. Mr. BRIDGMAN recommends that on the west side the frontage should be made to follow a curved line from the corner of Panyer Alley to St. Paul's Churchyard. The effect would be an addition of 20 feet to the roadway at PEEL's statue, 30 feet at St. Paul's Churchyard, and 30 feet opposite the Post Office Yard. The cost of the improvement is put down at 100,000*l.*, although very few houses are affected. Whatever is the outlay, something will have to be done to meet the traffic which, after the creation of a widened roadway, will still need severe control by the police. It was suggested that the London County Council and the Government ought to contribute towards the improvement, but it would be foolish to rely on either body. Fortunately, the City funds are not yet exhausted.

THE directors and proprietors of the Manchester Exchange have lately demonstrated that they were willing to undergo a sacrifice, in order to meet the interests of the citizens, by an alteration of the exterior of the building. But the Corporation are not satisfied, and seek for more land. Notices have been served on the directors by which, *apropos* of a scheme for obtaining accommodation, a building line is set down for adoption which is alleged to be an encroachment on their property. The Master of the Exchange has informed the Town Clerk "that the directors of the Manchester Royal Exchange are advised that it is open to grave doubts whether the laying down of the new building line indicated is within the powers of the Corporation, and accordingly the directors do not admit the validity of the notices, and will in case of necessity assert all legal rights and powers to which they may be entitled of erecting or altering their buildings in advance of the new building line mentioned in the notices. While thus protecting the rights of the proprietors, the directors desire, as far as possible, to avoid any course of action which would be opposed to the views of the City Council, and they have therefore resolved to provide additional accommodation for the convenience of their subscribers by means of such alterations inside the building as will not meanwhile necessitate any interference with the external structure." The communication, it must be said, is not a sign of diplomatic skill. If accommodation can be provided without any change of the exterior of the building, there was no use in asking authority for such a change. Again, if the notices are to be obeyed, there is not much visible gain in declaring they are to be resisted. In the contests between directors and City Council it is to be hoped the architect will not have to undergo the misfortune of mutilating his building more seriously than was first proposed.

THE new Archbishop of Westminster is credited with the possession of ability as a financier, a quality which no doubt helped to gain influence for him in Manchester. The sale of the seminary at Hammersmith by his Grace is a transaction which would do credit to any of the Fellows of the Surveyors' Institute. The buildings were erected to contain ecclesiastical students, but financially the college was not a success, and it was decided to have the training conducted elsewhere. Every expert knows that when buildings have to be employed for uses which the architect did not contemplate their value is much diminished in the market. It did not matter whether the seminary was utilised by the Jesuits or some other

religious order, or was vulgarised by the Salvation Army, as was one of the possibilities. In any case costly changes must be undertaken. As we believe the Jesuits offered 25,000*l.* for the premises, that sum may be considered as representing the market value. It was also desirable to lose no time in getting rid of the premises. Through his skill in conducting the negotiations (for his Grace was his own agent), the Archbishop has succeeded in obtaining 37,000*l.* for the property. The purchasers are the nuns of the French order of the *Sacré Cœur*, in whose schools young ladies of the highest and wealthiest classes are trained for society. We believe they acted on the advice of French agents, who are not necessarily the best judges of the value of property in London. As English ladies of all creeds are sent by their parents to the sisters' schools to be polished in French style, it is, we suppose, an advantage to offer equal facilities in England, and hence a liberal price was paid to gain a footing at the West End. It is to be hoped that for the alterations an architect will not be despatched from Paris. The buildings have been neglected by the occupiers, but they are among the best modern examples of collegiate Gothic, and the designer should have the control of any works that may be proposed.

THE sum of 115,000 francs granted by the French Government towards the cost of casts of examples of French sculpture for the Chicago exhibition has been expended. The progress of the art from the eleventh to the nineteenth century in France will be illustrated. There are casts of the portals of cathedrals with figures, each of which have cost about 10,000 francs. Examples of the Mediæval work at Clermont, Bourges, Chartres, Rheims, Beauvais, Amiens, Rouen, Paris, will be comprised in the collection. The sculpture of the Renaissance period will be suggested by casts ranging from the *Tomb of Francis II. and Marguerite de Foix* at Nantes to the JEAN GOUJON's *Fontaine des Innocents* in Paris. The seventeenth and eighteenth centuries have also a share, but the only representatives of the nineteenth century will be a work by RUDE and another by BARYE. If casts of later sculpture are desired they will have to be obtained in other ways.

ANYONE who is acquainted with the records of French life in the eighteenth century knows how very difficult it is to distinguish between facts and falsehoods. There were writers who found pleasure in inventing and printing calumnies, and every man or woman who was distinguished was liable to be traduced without any reason except the production of sport for writers and readers. At a later time there is a risk that the origin of the statements will be forgotten, and they will be accepted as historical facts. French society of the eighteenth century and the beginning of the nineteenth, in consequence, appears to many as corrupted throughout. A writer in the *Illustrated London News*, through this prejudice, has been led to make a statement which has given pain to a French nobleman, who, from the possession of property in England, may almost be accounted as an English gentleman. In describing an engraving of one of the miniatures which are on exhibition in New Bond Street the subject is said to be "Marquise DE NOAILLES, mistress of PRUD'HON, committed suicide 1821." There is no doubt the painter's mistress killed herself in 1821 on May 26, but her name was CONSTANCE MAYER. She was a pupil of PRUD'HON, and for eighteen years had charge of his home. He suffered the extremest remorse for her death. The most credulous believer in ancient scandals could hardly credit that two ladies killed themselves to vex PRUD'HON, therefore the description of the subject of the miniature is inaccurate. But it can be proved to be baseless in another way. At that period there was no Marquise DE NOAILLES. In 1802 a Marquise died very young, leaving a son, who was afterwards Duc and was admitted into the French Academy. But until 1868, when the marriage of his brother, who was then Marquis DE NOAILLES, was celebrated, the aristocracy of France was without a Marquise DE NOAILLES. It is well to put these facts on record, for otherwise we may expect to find that future biographers of PRUD'HON will have much to say about his conquests amongst the nobility, which are as legendary as those of Mr. MANTALINI or DICK SWIVELLER.

FRENCH GOTHIC.—II.*

THE Mediæval abbeys have not secured much attention from students of architecture. If the buildings are still used for habitation, one naturally hesitates to claim admittance in order to examine them. If they have been adapted to uses which the designers did not contemplate, they are sure to be deficient of many interesting parts. Such causes produce general neglect. It would need a lifetime to do justice to the survivals of the French abbeys, and the time would be well spent, although few might care about the information. The study of the abbeys is interesting on account of their character, and also because they may afford aid in working out the histories of the churches, cathedrals, and other Mediæval buildings. If, for instance, the great structures that were outside the limits of an abbey were designed by monks, we might expect to find examples of a similar design among the abbey works. It should be remembered that a monk was expected to be loyal to his order, and if possessed of talent of any kind he was glad to exercise it for the advantage of the house to which he belonged. The abbeys were, therefore, treasuries of the

religious purpose was designed by a monk, canon or ecclesiastic, yet after the twelfth century the architects, with some imperceptible exceptions, were laymen. He cites as examples of the latter ROBERT DE LUZARCHES, THOMAS DE CORMONT, HUGUES LIBERGIER, ROBERT DE COUCY, PIERRE DE MONTEREAU, JEAN DE CHELLES, and ERWIN DE STEINBACH. According to M. VITET, the round-arched or Romanesque buildings are the work of the clerics, while the pointed or ogival arch is a characteristic of a building which was produced by a layman. The intermediate twelfth century was therefore, according to him, a period of struggle between the adherents of the two systems.

A conclusion by M. VITET on any point in the history of Mediæval art calls for respect, but in this case he seems to us to have been too summary in dealing with evidence. If the monks were defeated by laymen in the twelfth century, they would not so easily abandon their own system to introduce one which in their eyes must have appeared as a worldly invention that was intended to delude good people. The pointed arch would be as little respected as physical science is now by many ecclesiastics. We find, however, that the new style was generally employed in abbeys, and that circumstance alone is enough to prove how it appeared as attractive to architects who were monks as to those who were laics. The identification of the style with ecclesiasti-

CELLAR (WITH ALMONRY BEYOND), MONT ST. MICHEL.

works of the community executed at different times. If a monk were employed as an architect, painter or sculptor by the secular clergy or by laymen, it may be assumed that he left some example of his ability as a memorial of himself among his brethren. The history of the Dominican artists by MARCHESE proves to us that the practice of reserving works for the convents was kept up until a comparatively late time. On the other hand, if we could not discover any correspondence between the architecture of some part of an abbey and the buildings of the surrounding district, it would be reasonable to conclude that the designer of the latter was not a monk, but a layman.

It is not possible to ascertain the names of more than a few of the Mediæval designers of France, but an effort has been made to determine whether buildings were designed by laymen or monks. M. VITET affirms as if it were incontestable that, although prior to the twelfth century every building in the north of Europe which was to be used for a

ALMONRY (WITH CELLAR BEYOND), MONT ST. MICHEL.

cism would be an impossibility without the most cheerful co-operation of the monastic orders as well as the clergy.

M. CORROYER recognises the importance of the causes which exercised an influence on French Gothic, and accordingly a division of his book is assigned to "Monastic Architecture." He says nothing about a contest of architects. He quotes M. A. LENOIR'S words:—"From the early centuries of the Christian era down to the thirteenth century architecture was practised only by the clergy, and came to be regarded as a sacred science." M. CORROYER explains how the monastic system arose and under what conditions the practice of architecture was made part of the duties to be observed. The power exercised by the monks of certain abbeys, such as Cluny, which became schools of art, is described, as well as the effect which changes in discipline and reformations in monastic practices produced on the character of churches. It is also shown, as in the following paragraph, that the lay architects derived their knowledge from masters who belonged to the orders:

It is bare historic justice to remember that the Middle Ages derived their chief title to fame, and all their intellectual enlightenment, from the abbeys, and that the great religious houses were in fact

* *Gothic Architecture.* By Edouard Corroyer, Architect to the French Government, and Inspector of Diocesan Edifices. Edited by Walter Armstrong. (London: Seeley & Co., Limited.)

schools, the educational influence of which was immense. It must be borne in mind that if the great cathedrals of the twelfth and thirteenth centuries were not actually constructed by the monks, their architects were nevertheless the pupils of monks, and that it was in the abbey schools, so generously opened to all, that they imbibed the first principles of the art they afterwards turned to such marvellous account. The study of architecture in particular was not merely theoretical. It was demonstrated by the monks in their important monastic buildings, the crowning point of which was the abbey church, a structure often larger and more ornate than contemporary cathedrals.

The disturbed condition of several districts in Europe compelled the monks to fortify their abbeys for the protection of their valuables. As the abbots were often obliged to furnish men and arms to their kings the abbeys were treated as ordinary castles by enemies, and it was therefore

REFECTORY, MONT ST. MICHEL.

necessary to strengthen them against besiegers. Our readers who may not be archæologists cannot fail to remember from SCOTT'S "Monastery" and "Abbot" the dangers which surrounded monasteries at times of disturbance.

One of the most interesting survivals of a fortified monastery is Mont St. Michel, on the French coast. Anyone who has visited the place will recollect that the site possesses those natural advantages which impart security. The buildings can only be approached during a limited number of hours every day, but the Benedictine monks resolved to make security doubly sure, and they constructed works which still excite admiration. M. CORROYER has been long officially connected with Mont St. Michel, and there is no architect living in France who has a more exact knowledge of every part of the buildings. The top of the hill is about 250 feet above the sea, and the architects adapted their buildings to the peculiarities of the site. As M. CORROYER says, they set about their work on the same principle as the Pyramid builders, and a section of the hill and buildings may be said to be pyramidal—an arrangement that is most impressive, from whatever side the group is observed. The church is the nucleus of the group, and around it are erected cloisters, towers, guest-rooms, dormitories, &c. The buildings have been raised in various periods between the eleventh and fifteenth centuries. For example, the Galerie de l'Aquilon, or Gallery of the North Wind, as will be apparent from the woodcut, belongs to the early part of the twelfth century; the vaulting is of a later time. In 1203 a great part of the buildings were destroyed. Under Abbot JOURDAIN and his successors almost the entire monastic buildings were constructed:—

As the peculiarities of the site made it impossible to adhere strictly to the Benedictine system of direct communication between the main

buildings and the church, the *lieux réguliers*, or accommodation reserved for the monks, were disposed above the magnificent building to the north of the church, which from the time of its foundation was known as *La Merveille* (the Marvel). This vast structure fairly takes rank as the grandest example of combined religious and military architecture of the finest Mediæval period. The *Merveille* consists of three storeys, two of which are vaulted. The lowest contains the almonry and cellar; the intermediate storey, the refectory and the knights' hall; the third, the dormitory and cloister. The building consists of two wings running east and west. The apartments are superposed as follows:—In the east wing the almonry (see illustration), the refectory (see illustration), and the dormitory; in the west the cellar (see illustration), the knights' hall (see illustration), and the cloister. This splendid structure is built entirely of granite. It was carried out by one continuous effort, under the inspiration of an incomparably bold and learned design of the Abbot Jourdain, to which his successors religiously adhered. The undertaking was entered upon in 1203 and finished in 1228, the final achievement being the cloister, the architects or sculptors of which are commemorated by an inscription in the spandrel of one of the arcades in the south walk. To fully appreciate this stupendous monument we must realise the extraordinary energy which enabled its architects to complete it in the comparatively short space of twenty-five years. We must take into account the conditions of its growth—its situation on the very summit of a rugged cliff, cut off from the mainland at times by the sea, at other times by an expanse of treacherous quicksand. We must also consider the enormous difficulties of transporting materials, seeing that all the granite used was quarried by the monks from the neighbouring coast. It is true that an unimportant quota of the stone was dug from the base of the rock itself. But though the passage across the sands was by this means avoided, the difficulties of raising great masses of stone to the foot of the *Merveille*, the foundations of which are over 160 feet above the sea level, had still to be met. It seems certain that the east and west buildings of which the *Merveille* consists were built at the same time, for though certain differences are perceptible in the form of the exterior buttresses, they evidently result from the interior formation of the various apartments. A study of the plans, sections and façades of the buildings is convincing on this head, and the general arrangements, notably that of the staircase, all point to the same conclusion.

The character of the work may be inferred from the engravings after M. CORROYER'S drawings; but from Mont St. Michel a great many most valuable illustrations could be derived. It is not only in refectories and cloisters that skill is seen, but there are countless parts within and without which reveal the mind of an artist. It is a treasury for

CHAPTER-HOUSE, OR "HALL OF KNIGHTS," MONT ST. MICHEL.

which the French may well feel grateful. It would be a crime if the conservation of the building were neglected on the score of economy, or in the hope of offending the clerical party.

Another chapter relates to the circumvallation of the towns. The gatehouse of Mont St. Michel prepares the visitor for what he has to see on the summit of the rock, and at Carcassonne, Aigues-Mortes, Avignon, St. Malo, beauty was imparted to the sternest system of defence. The Mediæval

builders were unable to realise that ugliness must be a quality of utility. One reason for the difference between the work of that period and our own is described by M. CORROYER:—

■ The Latin, Roman, Gallo-Roman, Romanesque and Gothic architects were versed in every department of the art they practised. The same architect was called upon to construct the church and the fortress, the abbey and the ramparts, which were often its necessary complement, the donjon and castle, the town hall, the hospital, the rural barn and the urban dwelling. He was responsible not only for the inception of every class and form of building, but for its successful elaboration; on him alone the responsibility of its execution rested; no scientific specialist checked his conclusions and verified his calculations as in our own time. The system by which the architect and the engineer have each their separate functions and responsibilities in the construction of the same building was unknown. The builder, or mason, as some would have him called, was an architect in the fullest sense. He himself traced the diagrams of his conceptions and directed the execution of every detail, careful alike of stability and beauty. It is a curious and disheartening phenomenon that such a direct contravention of the principles of Mediæval art as the modern system of divided responsibility implies should obtain only among the French, the very people to whom Western Europe owes its initiation into those principles. In England, in Belgium, in Holland, Switzerland and Germany the architect is also the engineer; the science and the art of his craft are inseparable. This intimate union of qualities gives an individuality to certain productions of these nations which we might well lay to heart and make the subject of serious comparative study. We must needs admit to begin with that we ourselves have become disciples rather than pioneers in a great movement.

The examples of castles and keeps, gates and bridges, are additional evidence of the relations between all classes of Gothic architecture. However diversified might be the purposes of the structures, and however novel the arrange-

GALERIE DE L'AQUILON, MONT ST. MICHEL.

ments, they all show a recognition of the principles of the art and a capacity to realise them. This skill is further seen in a great many of the civil buildings which M. CORROYER describes. The barns at Perrières and Provins, the granary at Vauclair, the lazaret-house at Tortoir, the hospitals at Angers, Ourscamps and Tonnerre (the last having a great hall measuring 300 feet by 60 feet, with an open timber roof) display remarkable skill in adaptation to necessities. The houses show no lack of variety, and whether stone or wood was employed, picturesqueness was aimed at and secured; even the houses in a long street became picturesque.

It was inevitable that M. CORROYER should be obliged to go out of France for the majority of his examples of town halls. The French Communes did not possess sufficient liberty or wealth to erect buildings of the class. M. CORROYER says that "the greater number of the infant Communes were sunk in poverty, and so overwhelmed with dues and taxes that they had no margin for communal buildings. In the fourteenth century even the Commune of Paris could boast only the most modest of town halls. In 1357 ETIENNE MARCEL, provost of the merchants, bought from the collector of the salt tax a small two-gabled building which adjoined several private dwellings. We may, therefore, conclude that down to this period the town hall was in no wise distinguished from an ordinary habitation."

It is not necessary to consider M. CORROYER's book further, and we arise from a perusal of the pages with an increase of our respect for the author. He must have found a difficulty in observing the limitations of so small a volume; but he has, however, contrived to produce chapters that will be a guide to all classes of French Gothic. The intention of the author was to address architects, but amateurs and tourists in France will find that the book is not beyond their comprehension, and a knowledge of the pages will impart additional interest to the buildings that are visited during excursions.

ST. MARY'S CHURCH, OXFORD.

THE Secretary of the Society for the Protection of Ancient Buildings must have an odd sort of passion to be confessed in public, for he has once more written to the *Times*, saying:—

The Society for the Protection of Ancient Buildings is by no means "annoyed" at having been unprovided with the information which Mr. Jackson himself has "still to verify"; nor will it be led away from the point at issue by his somewhat irrelevant attack. However fragmentary the old statues may be, there is still abundant interest in the genuine portions of them. This Mr. Jackson admits. Will he kindly tell us what interest he expects us to find in the proposed substitutes—confessedly imitations of the old work, used as makeshifts to conceal the gaps which will have taken place in the architecture? In the opinion of this society the manufacture of such things is in itself an injury to that art of sculpture which, as Mr. Jackson perceives, should always bear some serious relation to the buildings upon which it is employed. The Mediæval sculpture was never makeshift, but was produced by imaginative artists, doing their best to convey the ideas of the period in which they worked. Whereas the masons who have been trained to supply modern antiquities, in all styles, are not employed to express their own ideas. It is their business to turn out feeble and lifeless imitations, in which the shortcomings of the old work are parodied, while its merits are necessarily ignored. If any one desires to see what these productions are like, deplorable examples may be instanced throughout the country, and notably in the "restored" north porches of Westminster Abbey. Compare these with any of the mutilated porches which are, unhappily, so numerous in France. That of St. Etienne, at Beauvais, is a good example, through which, though every figure is shattered and headless, the undying beauty of the original conception still shines. Mr. Jackson appears to have misunderstood my use of the words "frankly modern." It is a matter of course that any intelligent sculptor would, so far as possible, put himself under the influence of the architecture of which his work was to form a part. But, if an artist of any character, and free from the trammels already referred to, he would still give us ideas expressive of himself and of the society of to-day, between which and the society of the Middle Ages there is so wide a gulf. This cannot be bridged over by servile imitation, but only by a sympathetic understanding of the discrepancies and *rapprochements* of either epoch. For my part I think that the "pedantry" does not lie with the society, which seeks to discriminate between the real works of an organic period of art and the makeshift diagrams which are too often used to supplant them.

Mr. Jackson in reply writes:—In former letters for which you have been so good as to find space I have explained that the statues round the base of the spire have so far perished that it is not safe even to allow their ruins to remain; and further that, if the niches are left empty after the statues are removed, the outline of the steeple would be spoiled. To this Mr. Thackeray Turner replies in your issue of to-day that new statues would be confessedly "makeshifts" to conceal the gaps that will have taken place in the architecture." This is certainly a humorous way of putting it. If the spire itself should fall in and have to be renewed, I suppose, by the same rule, Mr.

Turner would regard a new spire as a makeshift to conceal the gap which would undoubtedly have taken place in the architecture. And the statues at St. Mary's are in their measure as necessary to the completeness of the design as the spire itself. To his question, what interest I expect him and his friends to take in these proposed makeshifts, I reply that there is no reason why the new statues should not be as interesting as their immediate predecessors, of which the principal parts are only forty years old, but "whose effectiveness," Mr. Turner says, "has often struck members of his committee," until, I suppose, they found out they were admiring what they call spurious antiquities. With the latter part of Mr. Turner's letter I have no quarrel. I have not and never had any sympathy with mock-Medævalism, and as I said in my last letter, I have no intention to put up slavish copies of the old statues. Mr. Turner turns my "slavish" into "servile," and gives me back my own sentiments in no doubt much finer language. The Society for the Protection of Ancient Buildings has an excellent zeal; it is a pity it should not always be according to knowledge. The days and hours I have spent on the scaffolding of St. Mary's trying this stone and that stone in the hope of saving it, and in particular handling every bit of sculpture, and only bringing myself at last to the sad conclusion that preservation was impossible, may, I venture to think, carry as much weight as the protest of this society, written comfortably five doors off from here, without any examination of the building or any reference to the published reports, but simply demanding that the old statues should not be taken down because old sculpture is more interesting than new. We do not need Mr. Thackeray Turner and his society to teach us that. With this letter my share in the correspondence must cease. If Mr. Turner likes the last word he is quite welcome to it.

THE ANTIQUITIES OF APULIA.

THE Rome correspondent of the *Times* writes:—In the multitude of its exhausting demands on the budget the Italian Government finds something always for its artistic and archaeological interests, and some of its latest researches into the mines of art-wealth almost or quite unknown are of great value to students. Signor Boni, inspector of antiquities for Apulia, has been for the last year employed in cataloguing and securing photographs of the monuments of the region under his care, indicating, to the study of the architect and Mediæval archaeologist, basilicas and churches of the eleventh to the thirteenth centuries, with a wealth of material unsuspected hitherto. Amongst these is the discovery of a Norman cathedral at Nardo, entirely covered by *barocco* restorations of a Neapolitan bishop at the beginning of the last century, by the removal of which there appear the columns of the original, with capitals of olive and palm decoration, the motive of which is borrowed from that of the vases of Magna Grecia, with pictures of excellent technique, one of which bears the date of 1249, with an inscription recording that the Benedictine abbot, Goffredo, had caused them to be painted *tempore Divi Friderici* (Frederick II. of Suabia) by the painter Bailardo, with others of the thirteenth century of great value for the accuracy of the vestments of the clergy. The cathedral has three naves, with circular apses, and appears to have been the work of the Norman counts of the end of the eleventh century. The edifice presents singular characteristics in the dissimilarity of the arches, which differ on the two sides of the church, those on the right being of a rude and robust type, as of the first Norman construction, the left of exquisite elegance, with indication of Saracenic influence, the *ensemble* reminding of the façade of the Roman-Pisan church of St. Paolo à Ripa d'Arno, the portico of the abbey of St. Clement at Casauria, St. Ambrose at Milan, and other early structures, in which the composition involves symmetry without repetition in corresponding parts.

DRY ROT IN THE GLASGOW MUNICIPAL BUILDINGS.

AT the monthly meeting of the Glasgow Town Council on the 5th inst. among the business done, according to the *Glasgow Herald*, was the consideration of the minutes of the Municipal Buildings Committee of December 29, which contained a report by the city engineer on the ceilings of the City Chambers. The report stated that:—

The reporter had directed 35 plain-plastered ceilings of apartments, corridors and staircases to be laid bare and replastered. The examination of these ceilings, when they were exposed, showed in every instance the presence of dry rot in a more or less aggravated state of development. In one case the decay was so far advanced that part of a ceiling fell while the workmen were engaged removing an adjacent part. The fungus of dry rot has been more abundant in the ceilings of the corridors than in the apartments, and it now seems probable that

decay may be found in some ceilings which were formerly believed to be sound, although these will not be taken down until a further examination has been made. The incompleteness of the result of partial examination makes it extremely difficult to arrive at a satisfactory determination as to the actual state of the ceiling timbers. This was illustrated very remarkably one day this week, when a piece of timber, which had formed the support of a cornice, was found in a state of absolute decay at either end, the centre of the timber being to all appearances perfectly sound. The ceilings which have been already dealt with include all the rooms and corridors, and the staircase of the Town Clerk's office, the chamber keeper's room, Mr. Lang's office and the rooms adjoining with corridor and lavatory, the staircase giving access to the Master of Works' office, and two of the rooms occupied by his staff. The examination of the public offices of the gas and water departments has not meanwhile disclosed any apparent defect, but, in the opinion of the reporter, the whole matter should be continued for the further consideration of the sub-committee.

The committee remitted the matter back to the sub-committee for further consideration.

Mr. Wallace moved the approval of the minutes. Mr. Holmes seconded the motion.

Mr. Gray moved as an amendment that it be remitted to the committee to have interviews with the architect, inspectors, joiners and plasterers for their explanation as to the condition of the ceilings of the buildings at the present time. After the liberal expenditure in connection with these buildings it was most humiliating to have such a state of things existing as was now contained in the report of the city engineer. The Council should take up the position of having an explanation from the persons who ought to be able to say something about the condition of matters. They paid the joiner 80,000*l.*, the plasterers 18,000*l.*, and to the architects, inspectors and measurers 26,000*l.*, and these persons ought to give some explanation. The committee were previously empowered to get an examination made of the ceilings, and to take other steps as they might consider necessary. He did not know whether the committee had taken any further action, and, therefore, in the interest of the public, these parties should come forward and handsomely donate a sum of money for the erection of the fountains.

Bailie Brechin seconded. No stone should be left unturned to find out the cause of the present condition of matters.

Mr. Mayberry expressed the hope that the Council would remit to a committee to have a thorough investigation from beginning to end.

Mr. John Murray asked if the various tradesmen had been dealt with direct, and if the work had been accepted from them as finished, and the accounts settled? If that was the case, what was to be the result of Mr. Gray's inquiry.

Mr. Battersby asked if the Council or the committee who had charge of the erection of the buildings accepted the contracts from the joiners, plasterers and others, or whether it was one firm that was responsible for all the others?

The chairman (Bailie McLennan) said that in most cases the contracts were entered into direct between the Municipal Buildings Committee and the various contractors.

Mr. Steel suggested that an independent report should be obtained as to the condition of the building, the cause of the defects, and who was to blame.

Bailie Wallace, convener of the committee, said that the architect and the contractors had already been communicated with. He had, however, no objection to go over the same course again, and report to the Council. He might state that all over the country there were cases of buildings in the same position.

The Chairman asked, seeing that the matter had been gone into as the convener explained, if it would not meet Mr. Gray's view if the convener undertook to report the result of these investigations at next meeting.

Preceptor Dickson remarked that they had a committee in charge of the erection of the buildings, they employed inspectors, and they had an architect to whom they paid a very large fee. In these circumstances it was an extraordinary thing that they could not put up a building without the whole thing going to wreck and ruin. The Council should, therefore, have a thorough report on the whole matter.

Mr. Mitchell thought they should have a report from an independent authority. Surely they could saddle the blame on somebody, and perhaps get something back.

Mr. Martin did not think there was any necessity for the motion of Mr. Gray, because the committee had already had interviews with the architect, and had heard his explanation. No fault attached to the joiner, the plasterer, or any of the tradesmen. The matter complained of had arisen through the architect departing from that original plan of plastering in the corridors. For the purpose of deafening the rooms he inserted dooks into the concrete, instead of plastering on it, as originally intended. This was the reason for the dry-rot getting into the building.

Mr. Robert Anderson said the architect stated that the alteration to which Mr. Martin referred was done under the

approval of the Municipal Buildings Committee. No trace could be found of any such authority being given, and if the architect acted without authority of course he was morally responsible. Unless they were prepared to enter on litigation with the view of recovering something from the architect, he thought there was not any use of going further.

Mr. Mitchell proposed, as a further amendment, that it be remitted to the committee to obtain an independent report as to the cause of the dry-rot in the building.

Mr. Walter Wilson seconded this amendment.

Mr. Ure thought an independent report was unnecessary. They had full confidence in the city engineer.

Mr. Dickson thought if the committee put in the minutes all the information they had obtained that would be sufficient.

Mr. J. W. Dick thought that what they had to see to was to get the damage repaired without further expense being incurred.

Mr. Sinclair urged the convener to take the matter back and to bring up a new report.

Mr. Gray said he wished to have a vote, but ultimately, on Mr. Wallace agreeing on behalf of the committee to bring up a report embodying all the information they had received, both amendments were withdrawn and the minute was approved.

TESSERÆ.

The Greek Lesche.

THE Lesche has been represented as an oblong court, the longer sides of which were appropriated to the paintings and the front ornamented with an open portico. From the very general application of the word, frequently to buildings which had been erected for other purposes, it is uncertain whether any edifices were raised with the sole object of being a place for lounging and conversation, and whether such edifices had any distinct peculiar form. Certain it is that no buildings in all Greece are preserved to us of this nature, although we are informed that at one time they were of so extensive an use that in the city of Athens alone there existed no less than 360. But as it is possible that buildings may have been expressly constructed and set apart for such a destination, and as one of the most striking excellences of Grecian architecture was the appropriateness of each building to its specific purpose, and as the descriptions of some of these buildings do appear to correspond together, so we should endeavour to ascertain what form of arrangement will best combine to answer the various requirements of such a building. The first particular we have of the Greek Lesche is that it was a building without doors. A modern building which has much of this character is the Ruhmeshalle, or Hall of Renown, at Munich. It has nine columns at the flanks and seven inside. The columns are 4 feet 1½ inches in diameter, English measure. We have here a building of important dimensions and decorated with paintings, but having neither door nor chamber. From Hesiod we learn that it was warm, and that in winter time any close warm room to which people resorted constituted a Lesche. From this passage Siebelis conjectures that the Lesche was not *ἀθύρωτος*, but closed in on every side. This, however, does by no means follow, for the building might have been of any form, and opened or closed indifferently provided it was warm. The Lesche was, moreover, sunny, and resorted to by old men, who loved its genial warmth and could take their gentle exercise in its porticoes or enjoy quiet and repose on the ample seats. The most general, and indeed as its name denotes, the most apparent destination of these buildings was for the purposes of conversation. From Plutarch it appears to be a place of assembly and conversation. From "Ei apud Delphos" and from Suidas, a place for disputing on scientific and philosophical subjects. From Proclus it seems to have been devoted to any profitable conversation. Poems were recited in them, and even Homer is said to have sung his verses in the Lesche of Cyma. From Eustathius, Proclus and Moschopolus we may gather that they were frequently diverted from these intellectual occupations to idle gossiping and chatting. Pausanias, in his description of this at Delphi, says they were used for idle and serious conversation. Antiphon, again, calls the Lesche a place for lounging; Harpocration, a place for idle people; while Homer, Hesiod and their commentators make it a place of resort for beggars. From these several authorities it would appear that the Lesche was provided with ample seats, which might be placed in recesses, called *exhedræ*. Another feature of the Lesche was probably a long ambulatory or colonnade for the philosophers to exercise and enjoy themselves in. The Lesche appears to have been generally painted, and therefore frequently called *Pœcile*, or enriched with a variety of ornaments such as paintings. The latter building appears to have consisted of a *stoa*, or portico, which would naturally be suitable to the purposes of a Lesche, so that we may conceive that these buildings were frequently identical. Pausanias informs us that the Lesche at Delphi was decorated with pictures, and that the

stoa at Athens and one at Elis were called *Pœcile* because decorated with paintings, and that one of the two Lesche at Sparta was also called *Pœcile* for the same reason. Lastly, the portico in Hadrian's Villa, which has been taken as the type of the Greek Lesche, is called the *Pœcile*, and the *Pœcile* was among the buildings executed at Tivoli by the Emperor Hadrian. Another important circumstance connected with these buildings is that with the exception of the Lesche at Delphi, which had a painting on each side of the wall, all the other instances referred to by Pausanias had but one painting, or one wall decorated with paintings, which, if we may judge from the Long Portico at the Piræus, was executed on the southern or principal side. Thus, although Pausanias describes at length the paintings in the *Pœcile* at Athens, painted by Polygnotus, Micon, &c., in a portico at Athens painted by Euphranor, and in the Long Portico of the Piræus painted by Leochares, he describes only the painting or paintings on one wall in each of these edifices. It is probable that all these buildings were ornamented with statues. The Corcyrean portico had statues on each side of the wall, and Pausanias incidentally notices certain statues in the Royal Portico at Athens, in the *Pœcile* of that city and in the *Pœcile* at Elis. Among other decorations the *Pœcile* at Athens was ornamented with shields and other spoils.

Gibson and Thorvaldsen.

In some instances the works of John Gibson have been compared with those of Thorvaldsen, and a certain identity of career and character may be traced in many points between them. Gibson, however, gains by the comparison. Both sprang from the lowest class of society, and both found their true home and inspiration in Rome; but Thorvaldsen was brought there by no aspiration of his own, and almost against his will. Gibson never rested till he had, as it were, worked out his passage to the great goal of his ambition. Both were either sculptors or nothing; but Thorvaldsen was phlegmatic and laggard in his work. Gibson had a will which never flagged in the fulfilment of his obligations. Both were easily imposed upon, but in Thorvaldsen's case credulity was accompanied by a strong mixture of suspicion. Friends knew all that was in Gibson's mind. No friend ever penetrated into the secrecy of Thorvaldsen's. Both were childlike in indifference to outer appearances, in ignorance of business, and forgetfulness of their dinner engagements; but Thorvaldsen only mistook at which great house he had to dine, or never rightly understood where he had been dining; Gibson forgot that he had to dine anywhere at all. When they are both designated as childlike, and the charm that each possessed in that respect is admitted, it must be remembered that that characteristic includes somewhat that, in a man, is neither pleasant nor convenient. The indulged child is generally ungrateful, the praised child vain. Neither of these great artists was entirely free from the fault or the foible. But, as regards the fault, Gibson must not be included in the same category with one who kept his first patron—him from whom, humanly speaking, all his subsequent success flowed—waiting twenty-six years for the fulfilment of his engagement. Further, neither were tested in their lives and conduct by those family obligations which are entailed by marriage; but Gibson, at all events, did his duty by such as belonged to him, while Thorvaldsen let his own father die in an almshouse, while he supported the faithless wife of another man. Finally, both bequeathed their works and their fortune—Gibson nearly all, and Thorvaldsen nearly half of his—to the academy of their native country; in Thorvaldsen's case to be received with gratitude and augmented with liberality, in Gibson's without any token of adequate recognition.

Assyrian Records.

The public records of the Assyrians were engraved on stone, for which the arrow-headed character, from its simplicity, was peculiarly well adapted, and were usually placed on the walls of temples or palaces, and on rocks. For private as well as in some cases for public purposes, two other materials appear to have been used, baked clay or terra-cotta, and rolls of leather or papyrus, as in Egypt. In the first case the letters were stamped or incised with a sharp instrument upon the moist clay, moulded into the shape of an octagonal or hexagonal cylinder, or into square or oblong tablets, and then baked in the furnace. An immense number of such documents have been discovered in Assyrian and Babylonian ruins, and a large collection is now in the British Museum. The cylinders are historical and are inscribed with the records, in the shape of annals, of various kings of Assyria, by whose orders they appear to have been distributed amongst the different cities of the Empire, to be deposited, it may be conjectured, in the public archives. The smaller tablets are mostly of a more private nature; some are evidently contracts for the sale of land or other property, and have upon them impressions of seals and the names of witnesses; others appear to commemorate dedicatory offerings to the gods; others again have chronological tables and astronomical calculations which will probably prove of great value;

and upon some have been detected alphabets and apparently lessons in grammar or spelling. In fact, there is reason to hope that they form almost a complete Assyrian library, furnishing us with a vast amount of information regarding the history, sciences and customs of the Ninevites. No remains of the scrolls of parchment or papyrus have been as yet discovered; they have probably all been destroyed by time, but seals once appended to such documents have been found in considerable numbers, and in the bas-reliefs officers are continually represented as registering on such scrolls with a pen or stylus the amount of the slain and of the spoil after a battle.

Mediæval Coloured Decoration.

If we take a series of examples of coloured decoration, we find that there are two broad styles, one which we may call the Norman style, reaching down to the time of Henry III., and a second reaching down to late in the fifteenth century. The Norman style seems to have been adapted to the tastes of those who had been accustomed to see colour produced by the use of different constructive materials. An arch, for example, which we should treat as a great banded bow, with concentric lines of colour, is often under the Norman style treated as if it were of different coloured stones, and is painted accordingly, with the alternate voussoirs of different colours; and at Winchester we even find a label moulding divided into spaces to match these voussoirs, and painted of contrasting colours, *e.g.* where two neighbouring voussoirs are red and green, the adjoining spaces of label will be green and red. In the coigns of openings also the same principle obtains, and one stone is painted red, another yellow, and the next green. We also commonly find produced in painting those forms with which we are familiar in sculpture. The usual chevron moulding, for instance, is frequently reproduced in colour. The effect of sculpture is also frequently heightened by tinting it with colour. The capitals of pillars also are sometimes painted. In one instance the groining of the roof is heightened by lines of red, with yellow at the intersections, producing an agreeable relief to the stone colour. In the second style, which obtained in the fourteenth and fifteenth centuries, we find the ground of parchment colour often diapered with roses, fleurs-de-lys, or other patterns. Sometimes those patterns are enclosed in a kind of frame, as if intended to imitate pieces of tapestry work. It is in this style especially that we find historical painting introduced for wall decoration. For the most part subjects are drawn in outline only, with washes of colour in the drapery of flat tints of low tone. These paintings are arranged in various ways on the walls. At Wiston, Suffolk, they are arranged in panels under a painted arcade, which runs round the walls between the windows. At Headington, Oxon, they are placed upon the splays of the windows. In some other churches they are between the clerestory windows, in others in the spandrels of the nave arcades. In a chapel at St. Brelade, Jersey, they are arranged in three lines in the vaulted roof over the windows, and run in a continuous line, like the subjects in the Bayeux tapestry or the sculptures in the Salisbury chapter-house. Still more frequently we find these wall-paintings placed on the walls of different sizes, without any principle of arrangement or any connection of subjects, as in the heterogeneous collection in a modern picture-gallery.

The Chapel of the Nine Altars, Durham.

The Chapel of the Nine Altars is in seven divisions, formed by lofty clustered piers of stone with slender detached shafts of Frosterley marble, all united together under one capital. The piers are banded on a level with the string course at the base of the lower stage of windows, and again midway between that and the capitals. The central division is of the same width as the choir, and has three lancet windows to the east, with slender attached clustered and banded shafts in front of the window jambs and supporting their arches, the architraves of which are enriched with the tooth moulding, and terminate in corbel-heads. Single lancet windows of similar character and decoration occupy the lower stage of all the other compartments on the eastern side. Corresponding windows, of a smaller size, occupy the upper stage of the divisions, excepting the central one, which is entirely filled by the magnificent marigold or Catherine window, which gives character to the eastern termination of the building. Its tracery was restored with tolerable regard to the period to which it belonged, about the year 1795. It consists of an outer circle of twenty-four lights, and an inner one of twelve, radiating from a foliated circle as their common centre. The painted glass with which it was originally filled by the liberality of Richard Pickering, rector of Hemingburgh, between the years 1409 and 1413, has perished, and has been replaced by the fragments of that which once adorned the other windows of this chapel. Previously to the alterations in 1795 these windows were filled with tracery of the Perpendicular period, the work of Prior Wessington, and were adorned with painted glass, representing the legendary history of the saints whose altars stood beneath them. Wessington's tracery was not restored, and the whole range of

the eastern windows of the nine altars now appear in their original Early English character. The Perpendicular tracery of the windows at the south end was sedulously recopied when that part of the building was restored in 1827. The great window of the north end was called Joseph's Window, from the history of that patriarch being therein depicted. It is of Early Decorated work, and is singularly interesting for the beauty and simplicity of its Geometrical tracery. It may be further remarked (to use Mr. Billings's words) that "it is perfectly unique in the repetition internally of the great ribs of the tracery supported on clustered columns, the latter being connected with the mullions by through stones at five different places, which add materially to the strength of the whole. There is an iron bar which appears to be original, acting as a tie, running through this internal tracery and resting upon the capitals." An arcade runs round the whole of the lower part of the interior, consisting of a series of trefoil-headed arches, supported by slender detached single shafts of Frosterley marble. The hood mouldings of the arches terminate in corbel-heads of various device, kings and bishops and cowed monks—most of them, unfortunately, sorely mutilated. The space above, between the arches and the string-course, at the base of the lower windows, is occupied by a range of quatrefoils, sunk into the wall, with bold projecting mouldings. The altars have evidently been an integral part of the original design, as may be seen by the most cursory observation of the manner in which the arcade is made to adapt itself to the places which they occupied.

The Parvis of Peterborough Cathedral.

The construction of this elegant little edifice is extremely scientific, especially in the manner in which the thrust is distributed through the medium of the side turrets so as to fall upon the buttresses in front. These turrets being erected against one side of the triangular columns on the right and the left hand support them in two directions at once, *viz.* from collapsing towards each other and from falling forward. The latter pressure is thrown wholly upon the buttresses in front, which project 7 feet beyond the base of the great pillars. The style of this parvis on the whole is Decorated, and not Perpendicular, as some have thought, judging too exclusively by the lines of the window tracery. The form of the entrance archway (which is not four-centred, but pointed-segmental, just passing into the former by rounding off the inner order of mouldings at the point of contact with the impost), the details of the capitals and groin-ribs, the plan of the vaulting, the panels and canopies of the front, and the later forms of the curvilinear tracery point to about the year 1370 as the date of its erection. Many critics have objected to this parvis as an unsightly incumbrance in its present position, considering that it violates the uniformity of design displayed in the west front. The principal matter of regret perhaps is the concealment of the upper part of the great inner doorway, which probably yet retains some interesting sculptures and enrichments above the central dividing shaft, like the quatrefoil in the great west doorway of Croyland Abbey. It is likely, however, that its insertion was not a question of taste, but of necessity for the safety of the fabric.

Greek Colouring.

The Greeks applied colour with the particular object of clearing out and rendering their detail more distinct; the Saracens covered the entire surface of their buildings with colour, whether in the intricate moulding or the flat surface, but always in strict architectural arrangement; while the Gothic architects frequently employed coloured decoration without reference to the form, as in clustered columns, which are frequently covered with large diaper work. In the Greek temples we admire how the sculptures are brought out by a blue ground, how the horizontal line of the sculpture on the cella wall brings out the perpendicular lines of the columns in front, how the architects endeavoured to "neutralise" the confusion arising from a grove of columns in the pronaos and posticum of their temples, how the indistinct forms of the mouldings and ornaments in the soffits were lightened and picked out, and, to select one instance, how in the Erechtheum the dark confused shade produced by the great projection of the northern portico was remedied by the aid of toreutic art. The walls of Ecbatana were painted white, black, purple, blue, orange—and the last two were silvered and gilt. At Athens were two tribunals, the green and red, clearly showing that these colours were the predominant ones employed in those particular buildings. What constitutes the charm of the houses at Pompeii is the variety of decoration which abounds in them. They did not select any set colour or design which they conceived to be the most beautiful and adhere to that invariably, but they endeavoured to give a different character to each portion of the house. What can be more beautiful than the chaste arabesques on a white ground which decorate the tablinum of the Casa delle Capitelli Colorati, unless it be the more celebrated arabesques on a black ground in the house called, in consequence, Casa della Camera Nera?

ILLUSTRATIONS.

THE STAIRCASE OF FRANCIS I., CHATEAU DE BLOIS.

THE castle of Blois is mainly the work of LOUIS XII., FRANCIS I. and GASTON, of Orleans. The part erected by FRANCIS I. is generally most admired, and among all the staircases not one has been so often drawn as that which we illustrate this week, and which is the central point of one façade. In a country where so much of life is spent out of doors it was an advantage to have free access to the balconies, and Blois is not the only case where the approaches are open. The raking lines, instead of horizontal, were inherited from Gothic rather than from Classic times. The figures under canopies are the work of JEAN GOUJON. He may also have carved some of the salamanders of FRANCIS I., a device that is found throughout the parts which the king had erected. It has not yet been discovered who is the author of this admirable work. Among the scenes of which Blois was the theatre was the murder of the Duke of GUISE. The Vieux Cabinet, where the tragedy took place, was approached by this staircase.

TATE CENTRAL LIBRARY, BRIXTON.

THE new library recently erected at Brixton, and illustrated in this number, is from the architect's drawing, which was exhibited in the last Academy exhibition. The building (with site) was presented to Lambeth by Mr. HENRY TATE, and was carried out from the design and under the superintendence of Mr. SIDNEY R. J. SMITH, F.R.I.B.A. (the architect of the new picture gallery which is being built at Millbank). The cost of the library and site was 15,000*l.* The red bricks are from Elham Valley, the stone in the facings is Portland and Beer, the fittings, news-stands, tables, counters, &c., are all carried out in polished walnut. The dimensions of the main rooms are as follows:—Magazine-room, 35 feet by 27 feet; newspaper-room, 45 feet by 35 feet; lending library, 46 feet by 37 feet; reference library, 85 feet by 28 feet; and book store, 46 feet by 38 feet. In the basement are book-stores, binding-rooms, strong-rooms, &c., and at the side is the librarian's house. The carving was executed by Mr. C. SMITH, the heating and lighting by Messrs. Z. D. BERRY & SONS, and the ironwork construction by Messrs. DENNETT & INGLE, Messrs. WAYGOOD for lift fittings, and Mr. STONE for the iron railings and staircase railing. Messrs. F. & H. F. HIGGS, of Station Works, Loughborough Junction, were the contractors. This is the third library, so generously given by Mr. TATE to South London, that has been carried out by Mr. SMITH.

The Imperial Institute.—We omitted to state last week that our illustrations were reproduced from photographs by Messrs. Bedford Lemère & Co. But it was hardly necessary, for as their plates are superior to all others in this country, copies from them can be easily recognised.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening, Mr. Macvicar Anderson, president, in the chair.

Medals and Prizes.

The award of prizes was read as follows:—

Silver Medal and Ten Guineas (Drawings)—George S. Hill (Glasgow).

*Soane Medallion and 100*l.**—Arthur T. Bolton, Associate. Medal of Merit and ten guineas: James Scott Stewart. Medal of Merit: Alfred C. Houston, Associate (Ashpitel Prize).

Pugin Studentship—John James Joass. Medal of Merit: Thomas Arthur Sladdin. Hon. Mention: Harold Brakspear.

Owen Jones Studentship—Alfred Hoare Powell.

Godwin Bursary—Banister F. Fletcher, Associate.

Tite Prize—Charles A. Nicholson. Five guineas: R. S. Dods.

Grissell Medal—(Not awarded). Five guineas to Mr. W. Tait Conner, Associate.

Two Essayists five guineas each: C. Bernard Hutchinson, T. Rowland Hooper.

Mr. ANDREW N. PRENTICE, Soane medallist, then read a paper, of which the following is an extract:—

Tours in Spain and Majorca.

Mr. Prentice, in his introductory remarks, said he considered no country in Europe possessed the same variety of styles as Spain; and Seville was one of the most interesting of its cities—a city in which the hands of the Moor could be traced in the tortuous and narrow streets, the courtyards, the ancient walls and aqueducts, and lastly the famous tower of the Giralda. The original tower was built in 1196 by the Moors, and was of the same height as the campanile of St. Mark's; the Renaissance work was added by the architect, Hernan Ruiz, in 1568, and though considered by some to have spoilt the proportions of the tower, it was to the author's mind a very picturesque object. The sacristy of the cathedral was a spacious apartment in the Renaissance style, while the Sala Capitular was more beautiful and refined. The latter was in the form of an ellipse, the ceiling, pavement and walls being decorated in the most splendid style. Through the instrumentality of the Institute Travelling Card he obtained permission to measure the great screens around the high altar. After the cathedral the Alcazar was the next building of importance, and he had spent several weeks making sections and plans of its beautiful details. It was a large Moorish building somewhat later in date than the Alhambra, and, though smaller, equally fine. The entrance gateway was magnificent, and there were more variety of wall tiles than at Granada, of which he had taken full-size rubbings. Much of the original colouring remained in spite of the cruel whitewashing to which the building was subjected in 1813. Another palace in Seville in a semi-Moorish style was the Casa Pilatos. It had a large courtyard some 50 feet square, the walls of which were covered with tiles to the height of 10 feet. The Casa Ayuntamiento was a very fine specimen of the Plateresque style, and worthy of mention. Although familiar with the appearance of the Alhambra from photographs and books, any one entering its courts for the first time could not but be carried away by the novel surroundings, and interest was at once awakened as a new-found treasure. After Seville he, at first, had the idea that the Alhambra was a blaze of colour; but, with a few exceptions of decoration, the delicate traceries and walls were of a creamy and white colour. If the Alhambra had ceased to charm the architect at home, from the many vulgar attempts at its reproduction, still, any one with a soul for the artistic could not fail to appreciate the wonderful grace of form in the proportion of the arches and openings. A careful study of any of its parts was a useful lesson to the student; the Hall of Ambassadors, for instance, the entire surface of which was a mass of decoration, still it did not appear in the least degree overdone. This effect, he thought, was gained by the variety of the ornament, and the mode of placing a large pattern next to a small and intricate one. The advantage of beginning at the floor level with a delicate arabesque, and increasing in boldness as it ascends, also became apparent. Under Italian influence the still unfinished Renaissance palace of Charles V. had been begun in 1526—a building unique in Spain both for its style and plan. Built in close proximity to the Alhambra, Spaniards seemed to have taken a dislike to its formal style, and had evidently preferred to imitate their own buildings, their sympathies lying more with the Moorish work. Having drawn attention to the many points of similarity between the Moorish and Renaissance work—notably in the increasing boldness of the arabesques the further they receded from the eye, and in the mode of lighting, he considered a careful study of the plans of Moorish buildings of great value and interest. Nothing was haphazard. The doors and halls were arranged on a central axis producing charming vistas, while, no matter what size the houses were, they all had courtyards, varying from 6 feet square, as on the Torre Captiva, to the large Court of the Lions, 116 feet by 66 feet. During a stay at Cordova he made a study of the entrance to the Holy of Holies in the mosque—a most impressive piece of decoration. Besides the mosque, many instructive lessons might be gained by an exploration of the town. His first impressions on arriving at Toledo were disappointing. Coming from the south, where the houses and streets were bright with colour, Toledo looked grey and cold; on returning after a journey in the north his impressions were completely reversed. It contained many specimens of the Early Renaissance work. The popular idea that Spain was the country *par excellence* of the grotesque in Renaissance architecture he was well aware of, and he knew few countries where the spirit of *abandon* was so completely displayed. But when the Renaissance in Spain was analysed it was found that it was divided into three distinct periods—the Plateresque, the Græco-Roman or Estelo de Herrera, and the Rococo or Churrigueresque. The principal buildings in Toledo described were the Hospital of the Holy Cross, the Alcazar, and the cathedral, which contained numerous iron screens of the Renaissance period. The study of such screens he had followed up at the cathedral of Cirenca, where the finest collection in Spain was to be found, and where the interior was a perfect mine of Renaissance detail in stone, wood, iron and rich jasper. Madrid possessed few ancient buildings of note, but

STAIRCASE OF FRANCIS I., CHÂTEAU DE BLOIS.

(From a Water-Colour Drawing by Mr. Waterhouse, R.A.)

several modern buildings had sprung up of late, constructed on the most approved fireproof principles, such as the Bank of Spain, a large new railway station and buildings connected with the municipality. Salamanca, after Seville, was the most interesting city in Spain, and might justly be called the home of the Renaissance. In the cathedrals of Spain the choir was situated in the nave, but in a number of smaller churches, and especially in conventual buildings, it was placed at the extreme west end. The journey to Leon and Santiago de Compostilla should not be missed; the latter place had a distinct character of its own, nearly all the houses being of granite and the street being lined with arcades. From Burgos he had brought several sketches of the local Renaissance, and the cathedral at Sigüenza, a city not often visited, contained many gems of Plateresque work. Owing to the absence of stone in the locality of Saragossa most of the houses were built of flat bricks crowned with wooden cornices. Of the many monastic buildings in Spain the Benedictine monastery of Poblet, now in ruins, was the most interesting and extensive after the Escorial. From Barcelona Mr. Prentice proceeded to Palma, in Majorca, where subjects for sketching were innumerable, from the large cathedral down to the door-plates of the houses. His object while in Spain had been to study and sketch as much of the architectural remains as time permitted, as he was conscious that the past was being trampled out of the country and many ancient buildings rapidly disappearing.

The paper was illustrated with drawings made by Mr. Prentice and Mr. Heber Rimmer.

A vote of thanks proposed by Mr. R. Phené Spiers and supported by Mr. Dawson, Mr. Blashill and Mr. A. Payne was unanimously accorded to the reader of the paper.

ARCHITECTURE IN DUNDEE.

A MEETING of the Dundee Institute of Architecture, Science and Art was held last week, Mr. W. Mackison, burgh engineer, president, in the chair. Mr. A. H. Millar, F.S.A.Scot., read a paper on "Curiosities of Architecture in Dundee."

Mr. Millar said there was a widely-spread opinion on both sides of the Border that Dundee was a mere burgh of yesterday, a place which had risen into importance during the present century, and which had no ancient history worth speaking of. This delusion had probably arisen from the fact that the increase of Dundee through the development of her commerce and manufactures since this century began had been phenomenal, and almost without a parallel in the kingdom. It could be proved from documents in existence that Dundee was regarded as a centre of commerce when Scottish trade was in its infancy, and that it was considered by the sovereigns of ancient times as one of the most important east coast burghs. From papers still existing in London it could also be proved that a regular trade was carried on between Dundee and that city towards the close of the twelfth century, and it might be remarked that this was an earlier date than had been found in connection with the commerce between England and any other Scottish town. Without dealing with the literary evidences of Dundee's antiquity, Mr. Millar said it was his purpose rather to trace the development of Dundee from early times to the present day by means of existing or recently existing buildings, to contrast the civic life of former times with that of our own day—to give, in short, a brief sketch of the history of Dundee in stone and lime. For that purpose the lecturer then had thrown on the screen a long series of excellent lantern-slides, arranged in chronological order. There was first exhibited a series of views of genuine old buildings, including the Old Steeple, Our Lady Wark; the old Custom House, known as Drummond Castle; Dudhope Castle, the Franciscan Nunnery, the Wishart Arch, and several of the carved stones now preserved as relics in the Old Steeple Museum. These, said the lecturer, brought them from the thirteenth to the close of the sixteenth century. A new era in the architecture of Dundee began with the work of William Adam, a name familiar and renowned in the history of Scottish architecture. The Town House was erected from his design in 1734, and the revolution in style which he then introduced had marvellously affected the architecture of Dundee even up till the present time. Views were then shown of a number of representative buildings which, the lecturer stated, were either confessedly modelled upon Adam's style or were unconscious imitations of it, such as St. Andrew's Church, the Trades Hall and the Union Hall, the two latter having been expressly designed so as to agree with the frontage of his Town Hall, near which they stood. As an example of the far-reaching influence of this architect Mr. Millar referred to the latest church erected in Dundee, the Gilfillan Memorial, in Whitehall Street, in which, he said, some of the most characteristic features of Adam's style were introduced, although probably

without intention. Leaving the public buildings, castles and urban mansions of the olden time, attention was next directed to street architecture. The regenerative activity of modern times had cleared away within the last twenty years very many of these relics of ancient social life, and though there were still some delightfully insalubrious closes and wynds and not a few charmingly picturesque slums in Dundee, the all-powerful Improvement Act of 1871 had cleared many of them away. Nevertheless, it was possible still to show streets and closes as they existed in Dundee in the middle of the sixteenth century and to indicate the forms of the street architecture in the principal thoroughfares of that time. Representative examples were then shown of the inner courts in some of the wynds and closes, the "posterior tenements" of the old charters. After speaking of the changes in the form of the outside staircase, the lecturer dealt with the development of architectural ideas in Dundee during the last fifty years, and views were projected on the screen of many of the modern public buildings. The quasi-Gothic style, as applied to church architecture about 1840, and the florid Gothic style, as illustrated by Sir G. Gilbert Scott's Albert Institute, were taken as examples of two varieties of these phases of architecture. Examples were also shown of the Grecian, Flemish, French Renaissance and Tudor styles, and also of what the lecturer designated that inexplicable abortion, the nineteenth-century atrocity. So enlarged were the ideas in Dundee that Dundonians could tolerate within the compass of one public square specimens of nearly all these widely divergent styles of architecture, each proprietor erecting his dwelling or public building with a supreme contempt for that of his next-door neighbour and making thereby a curious jumble of incongruities. Mr. Millar thereafter, by the aid of the limelight, threw on a screen a large number of sketches of ancient and modern buildings, giving interesting accounts of each, and pointing out the many peculiarities in the architecture of some of them.

THE DUTIES AND RESPONSIBILITIES OF ARCHITECTS.*

THE reading of this paper, and the discussion that will doubtless follow, will, it is to be hoped, bring out a little more clearly than at present exists the duties, liabilities and responsibilities of architects in the exercise of their profession. There have been so many decisions by the Courts affecting the position of architects, that by drawing attention to this subject and some of the principal cases decided, it will give, at any rate to the younger members of this body, some useful information, and be of assistance in our practice. It is proposed to divide the subject into three general heads, and to consider the duty and responsibility of the architect in connection with each as follows, viz.:—1. The design of the structure. 2. The supervision of its erection. 3. The granting of certificates. Other points than those expressly mentioned will be touched upon in the consideration of the matters arising under these heads, such as the authority of the architect to order variations, authority to order bills of quantities to be prepared, and other incidental matters; but the subdivisions adopted are sufficiently defined for the present purpose.

First, then, the responsibility of the architect in the preparation of the design. An architect is responsible for any errors in the preparation of the plans whereby the building owner suffers damage. In other words, an architect in designing a structure is bound to act in a skilful and careful manner, so that, so far as can be foreseen by the exercise of care and skill, the building, if erected, shall carry out the purpose for which it is intended in an efficient manner.

There is not, however, any implied warranty on the architect's part that his work is actually correct, nor can the architect be held liable for errors which might arise, providing he has exercised reasonable care and skill, and has honestly carried out his work to the best of his judgment and ability; but the meaning of this is evidently that if, in designing a building, an architect does that which any prudent and skilful person, exercising care and skill, would have done, and it fails, the architect is not liable for such failure. Of course it must always be a matter of evidence as to what constitutes negligence or ignorance, and unless the work has been carefully designed, and the specification thoughtfully prepared, errors will arise and unpleasant litigation ensue. Too much care cannot therefore be exercised in the preparation of the design, and in seeing that it fully carries out the requirements of the employer, and great pains should be taken to discuss fully all details of the plans and specifications, and to very carefully explain every contingency that can be foreseen in connection with them.

Before the contract drawings are prepared and tenders

* A paper read by Mr. W. J. Jennings, F.S.I., at a meeting of the Society of Architects held at St. James's Hall, Piccadilly, on Tuesday, January 10.

obtained, it should always be made a point to obtain, if possible, an acknowledgment that the sketch-plans—*i.e.* those plans which form the data from which the contract drawings are prepared—are approved by the employer, and these sketch-plans should not be destroyed. It might also be added, in passing, that this is a good opportunity for having a definite understanding, in writing if possible, not only of the remuneration to be paid to the architect, but upon such other matters as the ownership of plans, and travelling and incidental expenses, for although the usual 5 per cent. commission is recognised by custom as the proper remuneration, plus travelling and incidental expenses, this is by no means the invariable practice, and many naturally view with suspicion payment based on the cost of the structure. As to the ownership of drawings, in the absence of any agreement to the contrary, the building owner could claim them.

Another point which cannot be too strongly dwelt upon is the desirability of entering, in as minute and full a manner as possible, all verbal instructions received from the client relative to the proposed work, and to make such entries as soon as possible after the conversation.

Having thoroughly assured himself that the wishes of his client have been embodied in the designs, and that they are prepared in a skilful and reliable manner, the specification must next be drawn, taking care that the interest of the employer is safeguarded in every way, and that the contractor is made responsible for all errors of omission and commission whereby the building owner suffers damage, even if after the granting of the final certificate. Too much care and caution cannot be exercised in the preparation of the specifications and general conditions, as they are, of course, the basis of the agreement, and in the event of any dispute arising either between the building owner and builder, or between the building owner and architect, as to the method of carrying out the works, they are relied upon and interpreted very strictly by the Courts.

Before inviting tenders for the works, it is a good plan to have detail drawings to a sufficiently large scale to illustrate any ornamental portions of the design. It saves any question between the architect and builder as to the amount of work intended by the contract drawings, which, being generally prepared to a small scale, renders it impossible to say, with any degree of certainty, what is really intended, although it should be borne in mind that if details are given which show more work than can reasonably be presumed to be intended by the contract drawings, and the contractor execute these works without demur, he (the contractor) cannot afterwards sustain a claim for extras on the ground that the detail drawings constitute an order for the work.

Assuming, now, that the plans and specifications are prepared, tenders invited, and one accepted, and the contract signed both by the building owner and the builder, and that such contract contains the usual clauses as to the architect's certificate being a condition precedent to the builder's right of action against the building owner, and also provides for the decision of the architect in cases of dispute or difference of opinion, either during the progress of the work or in the settlement of the accounts, the work is commenced, and we arrive at the consideration of the second division of the subject, *viz.* "The duty and responsibility of the architect in the supervision of the work." Before, however, dealing with this head, it may be added that the condition as to the decision of the architect being final and binding in case of dispute in the making up of the final accounts is by no means always inserted in the contract. It is now more usual to have a clause appointing an arbitrator (other than the architect of the building owner) in the event of any dispute arising under the contract, and certainly from the builder's point of view this would seem the most satisfactory course to pursue. But so far as the superintendence of the work is concerned the position of the architect is not materially affected by this clause.

It should be distinctly understood that the position of the architect is materially altered directly a contract is entered into between the building owner and contractor, for the purpose of carrying out the architect's design.

Before any contract is entered into the architect's position is simply that of professional adviser to his client; but after the contract is signed his position is something more than this, for not only has he his duties to perform to the building owner, but he has to exercise his judgment and discretion in construing the specification as between the building owner and builder. Not only has he (the architect) to see that the building owner receives justice at the hands of the builder, but he must see that the builder is not hampered by an exacting and unscrupulous client. Above all things the architect must act in a thoroughly impartial and unbiassed manner, and let him always bear in mind that without express authority to the contrary his duty is to see that the contract is carried out without substantial deviation.

It is often found, however, in practice, that the building owner cannot realise the position in which the architect is placed as between the parties to the contract, and he will often

act—or try to through his architect—in the most exacting manner, and would construe clauses in the specification in such a manner as would render it quite impossible for the builder to carry out the work.

A difference of opinion often arises between the building owner and his architect as to what constitutes superintendence of the works. There are no definite rules laid down upon this point; and, indeed, it would be quite impossible to say how much superintendence is to be given to any work to bring it to a successful issue, so many matters having to be taken into account in each case. Oftentimes the building owner appears to look upon his architect very much as a clerk of works, and expects such a large amount of supervision to be given as would render it impossible for an architect to have more than one contract in hand at a time; but this view of the matter cannot of course be upheld. The actual amount of supervision must of necessity depend upon the architect employed. If he is an exceptionally busy man it is impossible that he can give much time to the superintendence, and a clerk of works is indispensable. As a matter of fact, no question of "amount of supervision" can be entertained; but it should be clearly observed that as the architect is responsible for the work generally, he should give such amount of time to it as will enable him to see whether or not the works are being carried out substantially as specified, and in particular he should make a point of seeing every part of the foundations before any concrete is put in, and all drains before allowing them to be covered in. Architects take upon themselves a great responsibility when they do not—as is too often the case—insist upon a clerk of works. Certainly it ought to be made quite plain to the building owner that in many matters of detail, in themselves most important, there is a great risk of having the building inferior to that specified unless there is constant supervision, such as only a clerk of works can give. If this were always put clearly before the employer, the Courts would attach more responsibility to the building owner and less to the architect, for defective work owing to the lack of minute supervision.

The employment of a clerk of works does not, however, relieve the architect of his responsibility, as the clerk of works is simply the agent, so to speak of the architect, who has the sole control, and is responsible for seeing that the works are carried out substantially as specified.

In the event of a building owner bringing an action against the architect, and alleging want of supervision, whereby he (the building owner) has suffered damage, it would not be sufficient to show that so many inspections had been made during the progress of the works, for it is clear that the actual number of visits an architect pays to the work is no guarantee—in many cases at least—that there has been proper supervision. Of course, if other things are equal, the more frequently works in progress are inspected by the architect, the greater will be the chance of their being well carried out; but there are many architects of great experience who would see more in one visit than others of less experience would in a dozen, and no one could plead with success that because he had made so many inspections during the progress of the works, therefore he had not been negligent; so then it may be said that it is not so much the "amount of supervision" that is the essential as the "quality." So in the case of *Rogers v. James* it came out in evidence that the architect had visited the works daily during the time the foundations were being put in, but this did not prevent his being held liable to the building owner for the damage caused by the omission of concrete foundations in places, and for other defects.

During the construction of the works the architect will often discover that something has been carried out or omitted contrary to the specification. In these days of keen competition on the part of the builders to obtain work, and owing to the very general desire of the building owner to obtain his work at the very lowest cost, irrespective of the character of the builder, the latter often resorts to the substitution of inferior materials and workmanship to make up for a very low price. Such questions then arise as, for example, the quality of the timber. Very possibly the architect has specified that none but balk timber is to be used, but the builder will try and substitute deals and battens, and so save the difference in price. It is quite possible that the architect may not have discovered this substitution until a great deal of the timber is built in, and the question arises as to what is the duty of the architect under these circumstances. It may be that the timber is the very best of its sort, and even it may be a matter of opinion which is the better of the two. The architect, taking everything into consideration, may be inclined to think that, as the taking of the timber out of the building and putting in that which is specified would be a very serious loss to the builder, and as there is not much difference between the two sorts after all, the case would be met by deducting from the contract price the amount of the difference between the two sorts. In that case one might assume that the employer had suffered no damage, but this is hardly the correct way to deal with such a case, neither is the mere difference in the price of the timber the

proper measure of the damage. In a case of this sort, and this view has been upheld in several cases, the duty of the architect is clearly to insist upon the materials as specified being used, no matter at what expense to the contractor. The question of timber is taken only as an instance, and one very commonly met with. There are many other points which might be taken, but the duty of the architect is the same throughout.

This brings us to another point which it is convenient to deal with under this head, and that is the authority of the architect to order deviations from the drawings and specifications.

Upon this point there is much difference of opinion, but, speaking generally, and in the absence of any express condition to the contrary, the architect's relation to the building owner in connection with the superintending of works would come under that class known as general agents, and he would have power to bind his clients to alterations which he may order the builder to carry out in the details of the work; but there must be no radical alterations in the plans, as the architect's duty is to carry out the plans and specifications which form the basis of the contract, and therefore he must be careful before ordering extensive alterations and variations. Of course, where an architect is employed simply to prepare plans he is on a very different footing, and scarcely comes under the head of an agent at all. In this case he has simply to supply something for which he receives a certain sum of money, and the matter ceases, but generally architects are not only employed to design a structure, but to superintend its erection, and then the architect may be considered in the light of a general agent for all purposes for which he is employed to the building owner. The case of *Kimberly v. Dick* clearly shows that this is the position of the architect.

The circumstances of this case were somewhat peculiar, inasmuch as there was a distinct understanding between the architect (White) and the building owner (Dick) that the total cost, including all incidental expenses and architect's commission, was not to exceed 15,000*l.* It was one of the conditions as between the building owner and the builder (Kimberly) that all questions between the parties under the contract should be settled by the award of the architect. The plaintiff was unaware at the time he signed the contract, or for some time after, that there was any undertaking given by the architect to the employer that the house should be erected for a sum of 15,000*l.*, and the contractor claimed to be entitled to be paid by the employer for all quantities executed by him beyond those included in his estimate and for extra work, and it was held that the architect was the agent of the employer, that his undertaking having been concealed from the builder the arbitration clause in the contract could not be enforced, and that the plaintiff was entitled to an account for what was due to him for any works executed by him, under the architect's direction, not included in the contract, and for any works so executed under the contract the price for which was not therein included, and for any variations made under the architect's direction, of work included in the contract.

In the course of his judgment Lord Romilly, Master of the Rolls, said :—

I proceed now to examine the contract itself, and shall then consider what works were then, and have been since executed by the plaintiff under the directions of White; this raises the question of the character in which Mr. White is to be considered in dealing with this case, and in doing so I am of opinion that I must treat Mr. White as the agent of Mr. Dick generally, for all purposes connected with this building, and that without any limitation as to price or anything else.

This case has been upheld repeatedly, but of course it does not prevent the building owner from recovering damages from the architect for exceeding his authority.

During the course of the building it often happens that circumstances which could not be foreseen cause some alteration from the drawings and specifications, such for instance as extra concrete in foundations, and as this is a matter that could not be foreseen, the architect would not be exceeding his authority in ordering it, although it might amount, as it too often does, to a very considerable sum of money.

Speaking generally, if it could be shown that what is done is absolutely necessary for the stability of the building and that without it the works would be defective, then the architect would be held not to have exceeded his authority; but this must not be taken to refer to works ordered by the architect to cover faults in the design which, by the exercise of skill and care, would have been avoided. In all cases, however, by simply advising the building owner what is proposed to be done, a great deal of responsibility would be taken from the architect's shoulders, and this course should invariably be taken in dealing with building committees and public bodies, and all alterations suggested by committees should be embodied in a resolution and entered in the minutes of the committee, and ordered in writing by the architect.

While upon the question of authority it does not seem out of place to say a few words as to the authority of the architect to order quantities to be prepared. It is a difficult question to

discuss owing to the want of any definite decision, but the general ruling would appear to be that where the building owner employs an architect to prepare plans and specifications and obtain tenders for the work to be done, this constitutes an order for the architect to retain a quantity surveyor and take out the quantities; but as there is so much doubt on the matter the only satisfactory method of proceeding is to let the building owner know that this must be done and be paid for by him.

Thirdly, the granting of certificates. Under a contract for building power is reserved to the architect to grant certificates during the progress of the building and for giving the final certificates, the latter class taking into account all variations made during the progress of the building and, after adjusting all additions and deductions, certifying for the balance. Certificates given during the progress of the works are usually provisional, and are subject to adjustment in the final certificate, but an architect having once given his final certificate it cannot be varied, and his duty is at an end under the contract.

There is considerable doubt on the question of the architect's responsibility in granting final certificates owing to the recent decision in the case of *Rogers v. James*. Previous to this decision many people had been of opinion that an architect when acting under a contract—wherein his decision was to be final and binding as between the building owner and builder in deciding any question as to workmanship or price—was in the position of a quasi-arbitrator, and in that position could not be held liable to either the building owner or builder, so long as he acted honestly and to the best of his judgment and ability—see the case of *Stevenson v. Watson* (which decision was founded on that of *Pappa v. Rose*). This was a case in which the plaintiff contracted with a company to build a hall, the plans, bills of quantities, &c., for which had been prepared by the defendant who was employed by the company, and named in the contract as their architect to carry out the works. The contract provided that the architect might order additions to or deductions from it, and that the amount of them should be ascertained by the architect in the same manner as the quantities had been measured, and at the same rate as they had been priced; that the contractor and the company would be bound to leave all questions or matters of dispute which might arise during the progress of the works or in the settlement of the account to the architect, whose decision should be final and binding on all parties, and that the contractor would be paid on the certificate of the architect. The claim then alleged that the contract was signed by the plaintiff in the belief and expectation, as the defendant well knew, that the defendant would use due care and skill in ascertaining the amounts to be paid by the company to the plaintiff; that the work was done, that additions and deductions were ordered and certificates given by the defendant, but that he did not use due care and skill in ascertaining the amounts, and neglected and refused to ascertain them in the same manner as the quantities had been measured and at the same rate, and knowingly or negligently certified for a much less sum than was the net balance payable to the plaintiff and refused to reconsider his final certificate, by reason whereof the plaintiff was unable to obtain payment from the company of the balance. On demurrer held that the functions of the architect in ascertaining the amount due to the plaintiff were not merely ministerial, but such as required the exercise of professional judgment, opinion and skill, and that he therefore occupied the position of an arbitrator, against whom no fraud or collusion being alleged, the action would not lie. The Lord Chief Justice was so emphatic of the principle laid down here that it is necessary to quote one or two extracts from his judgment. After reciting the case he (the Lord Chief Justice) said :—

This claim is for that which has over and over again been attempted without success; it is an action against a man for the negligent performance of a duty, in the doing of which the exercise of judgment or opinion is necessary. Such being the true view of the claim, the cases on that point apply and bind us. Speaking for myself, I entirely approve of them and think them sound and right.

That is, the architect is in the position of a quasi-arbitrator, and Mr. Justice Denman, in a judgment supporting that of the Lord Chief Justice, said :—

It seems to me that an architect is an arbitrator from the beginning to the end of the contract. He is throughout to have his eye on the work and to give certificates from time to time, all having reference to his final certificate, and unless he gave the duty up altogether from the first appointment, he is from the first a person exercising judgment on a matter on which the parties themselves cannot exercise judgment.

I think, therefore, that the parties have trusted to him, and that from the beginning he must exercise his functions fairly and honestly between them, and that if he violates that duty he is liable to an action. If he honestly performs them, then he honestly performs his bargain, or his duty if it be a duty, arising from the acceptance of the functions, and the parties must abide by it.

By this judgment the architect seemed placed in a very strong position indeed. Certainly this was an action brought,

not by the building owner against the architect, but by the builder against the architect, but it seems that if the builder was bound so rigidly to the decision of the architect—fraud and *mala-fides* not being suggested—how much more so was the building owner, who has the appointing of the architect, and whom the architect is naturally anxious to please? Certainly under this decision the architect was to a great extent made his own judge in the event of the building owner bringing an action against him, and yet if he is liable to an action by one party after having honestly exercised his judgment and ability in deciding matters in dispute, how is he to give an unbiassed decision? In the case of *Rogers v. James*, however, and this case should be considered by all architects, he, the architect, is under a very different position from that previously ruled, a decision which places him very much in the hands of an unscrupulous client, as a perusal of the case will show. The extract is taken from the professional notes of the Surveyors' Institution, vol. v. part 2 :—

In a building contract the architect's certificate is final as between the builder and building owner, but not as between the latter and the architect himself.

Action by an architect to recover 123%, the balance of his account for services rendered to the defendant in connection with the erection by a builder of a house at Bromley, Kent. The defendant counterclaimed for damages for negligence, owing to the plaintiff not properly supervising the building of the house, in consequence whereof the builder omitted to put certain concrete into the foundations and omitted to do certain other works. The plaintiff denied he was negligent, and further stated that in giving his final certificate to the builder he deducted 82% in respect of the omissions from the amount certified to be due to the builder, and contended that this certificate was binding upon the defendant under clause 16 of the contract between the defendant and the builder. Clause 16 provided that—

The decision of the architect with respect to the amount, state and condition of the works actually executed, and also in respect of any and every question that may arise concerning the construction of the present contract, or the plans and specifications, or the execution of the works hereby contracted for, or in anywise relating thereto, shall be final and without appeal.

The action was tried before Mr. Justice Mathew and a special jury, at Maidstone, where the jury found that the plaintiff had been guilty of negligence, and found a verdict for the plaintiff on the claim for 58%, and for the defendant on the counterclaim for 90%. The learned judge gave judgment accordingly. The plaintiff moved for judgment on the counterclaim or for a new trial. The Court dismissed the motion.

The Master of the Rolls said that the jury having found negligence in the plaintiff, the only material question arose upon the counterclaim. It was contended that the certificate which the architect gave under clause 16 of the contract was a final settlement of the amount of damages, and could not be questioned by the defendant. It was said that the certificate was final as between the building owner and builder: any question as between the building owner and the architect would not be decided by that certificate. As between the building owner and the builder the architect had, in the honest exercise of his judgment, awarded a sum which the building owner could not question. As against the architect, the building owner could question that. The jury had found that the architect was negligent, and that the architect had not awarded sufficient. The learned judge was satisfied with the verdict, and a new trial could not be granted. Whether the Court would have arrived at the verdict was not now the question.

Lord Justice Lopes concurred. The architect must not act negligently. Clause 16 of the contract gave the architect no jurisdiction to decide any question of negligence as between himself and the building owner, and the building owner could bring an action of negligence against the architect. The jury found that the 82% allowed by the architect was not sufficient, and they awarded the building owner a further sum from the architect. The judge was satisfied by the verdict, and that Court could not disturb it.

Lord Justice Kay concurred.

By this decision it will be seen that while the architect's certificate is final and binding, as between the parties to the contract, in the absence of fraud or collusion or any circumstances calculated to bias the opinion of the architect, and that while the building owner cannot be held liable for more than the award certified by the architect, yet after the architect has honestly done what he considers to be his duty to both parties, he is still liable to an action for negligence by the building owner. Under these circumstances it would seem that it would be more satisfactory to all parties if, in the event of any dispute between the building owner and builder, the matter was left in the hands of an independent person as arbitrator.

The certificate of the architect is binding between the employer and builder in the absence of any circumstances which would tend to bias the mind of the architect, but the architect having giving an undertaking that the building could be erected for a certain sum, this was held in *Kimberly v. Dick* to be a matter that would bias the architect in deciding between

the building owner and builder, and therefore his certificate was not upheld. Of course, too, undue interference on the part of the building owner might reasonably invalidate an architect's certificate.

Architects should be careful in giving certificates to see that they are in the form prescribed by the contract. A mere statement of accounts approved by the architects is not sufficient. Thus, in the case of *Morgan v. Birnie*, it was held that the fact of the architect having sent on the accounts to the employer, with a letter saying that they were correct, was no evidence of the work having been certified by the architect: this will show how essential it is that the spirit and letter of the contract in this, as in other matters appertaining to the building, should be carefully followed.

There have now been pointed out as fully as it is possible within the limits of a paper some of the pitfalls that an architect will meet with in the exercise of his profession, but in conclusion it may be said that if he shows reasonable skill and ability, and acts with tact and judgment, he need be under but little apprehension in dealing with building owners and builders, difficult though his position is sometimes made.

PRESERVATION OF ANCIENT MONUMENTS IN IRELAND.*

THE preservation, examination and illustration of all ancient monuments and memorials of the past, as connected with the antiquities of Ireland, are the objects for which our Society was formed in 1849; and number one of the general rules of the Royal Society of Antiquaries of Ireland, as set out in its constitution and approved of by Her Majesty the Queen through her Principal Secretary of State, continues to declare that these are still the first and only objects for which the Society exists. How far this purpose has been accomplished the forty-four bulky yearly volumes and the fourteen annuaries issued by the Society, with some thousands of illustrations, can abundantly testify.

The legislation on the subject of the protection of the ancient monuments of our country is of paramount interest to all our members, and with a view to their information on this and some points not easily obtainable save through the medium of numerous uninviting Blue Books, the Council of the Society have requested the writer to give in the pages of the Journal a short *résumé* of the scope of the recent and two former Acts, with a list of the structures brought within their operation. To do this is indeed in a measure obligatory on the part of the Council, as in the courteous terms of the letter of the secretary of the Board of Works charged with the administration of this Act, that communication is said to be made for the information of the members of the Society generally.

Mr. Ruskin appositely remarks :—"What we have ourselves built we are at liberty to throw down, but what other men gave their strength and wealth and life to accomplish their right over does not pass away with their death; still less is the right to the use of what they have left vested in us only. It belongs to all their successors." It was similar feelings of obligation to the past and duty to posterity that guided the unwearied labours of such men as Graves and Prim in our Society to preserve, so as to pass on to future generations, this heritage intact, and animated the minds of a band of workers, like Du Noyer, O'Donovan, Wilde, Brash, Windele, Hitchcock, Hayman, Caulfield, and many others now passed away, who placed on record accurate descriptions and illustrations of as many objects of interest in the pages of our Journal as came within their field of practical observation. The immense value of such methods of preserving ancient monuments is not fully understood. On this point Mr. Romilly Allen, F.S.A. (Scot.), says :—"It cannot be too clearly pointed out that the protection of ancient monuments, although in the highest degree desirable, is but a secondary consideration compared with the necessity of preserving some record of their existence in case they should be destroyed at any future time. Once an ancient building has been measured, planned, photographed, and accurately described, its loss will not be such a national calamity as if no particulars about it had been kept."

While the work of preserving in the sense thus indicated was going on vigorously and without intermission, a departure was made in the year 1857, and works of what some would call a more practical nature were entered upon at the Cistercian Abbey of Jerpoint, county Kilkenny, where, under the personal direction and supervision of Mr. James G. Robertson, architect, a sum of about 180% was spent on judicious and effective repair which preserved the principal architectural

* From "Notes on the 'Ancient Monuments Protection (Ireland) Act, 1892,' and the previous legislation connected therewith." By Robert Cochrane, F.S.A., F.R.I.B.A., M.R.I.A. Published in the "Journal of the Royal Society of Antiquaries of Ireland."

features of this interesting structure from threatened decay, and later on the excavation of the site of the extinct town of Jerpoint was undertaken. Of the other works successfully carried out by the Society, a passing reference may be made to the opening of the beautiful and unique choir window in the remains of the Franciscan Monastery at Kilkenny, where the services of Mr. Thomas Drew, architect, were given gratuitously. At Clonmacnoise the restoration of the twelfth-century arches of entrance doorway and chancel of Queen Dervorgilla's chapel was carried out under Rev. James Graves's personal supervision, and it remains a perfect specimen and illustration of the manner in which such work should be approached and executed.

Other work was done at the Clonmacnoise group of ruins, which cost upwards of 200*l.*, and the Round Tower of St. Finghin's Church, which was dangerous, was left secure. Not the least important work done by the Society here was the prosecution of a number of persons who had mutilated and injured the sculptured stones. It was the first prosecution of the kind attempted, and as it was widely known and talked of, must have had a most beneficial effect in deterring others from committing such wanton depredations. The cost of the proceedings was very heavy, and was defrayed by subscriptions collected by the Society for the purpose.

At Monasterboice the Round Tower was secured under the direction of Mr. J. Bell, architect, and a survey was made of the ruins at Glendalough for the Society by Sir William Wilde and Rev. James Graves, and in this case Mr. Drew's professional services were again at the disposal of the Society. Almost every ruin of interest in the country, where reported in danger, was examined, and where the Society could not undertake the work, local interest was aroused, and the desired object effected. The example thus set had far-reaching effects, and influenced a number of proprietors who had such monuments on their estates to take an active interest in their preservation.

While these operations were going on no opportunity was lost of directing public attention to the necessity of the preservation of the ancient monuments of the country by the Government, and the Society adopted a national petition to Parliament for an annual grant of money, to be laid out under the supervision of a committee of antiquaries, for the preservation of the ruins of ancient Irish buildings. The Poor-Law Commissioners (now Local Government Board) were, in November 1868, communicated with, and asked to introduce into all contracts for enclosing burial-grounds a clause against using any portions of the ruins of the ancient churches or any monument or sculptured stone found within the cemeteries; and to this request that body assented. It had come to the knowledge of the Society that in many cases contractors employed by Boards of Guardians had used the stones of the ancient churches for building the enclosing walls of burial-grounds, and the interference of the Poor Law Board in the manner suggested by the Society had the most satisfactory results. The Government of the day was approached, both in Parliament and by deputations to the responsible Ministers; memorial forms were adopted, printed and circulated, and petitions were forwarded from almost every town of importance in the country; and these efforts, combined with the exertions of the Royal Irish Academy under its president, Lord Talbot de Malahide, were instrumental in the introduction of a clause in the Irish Church Act of 1869 (32 and 33 Vict. c. 42), under the 25th section of which the Irish Church Commissioners were empowered to transfer to the secretary, Board of Works, "upon trust for preservation as a national monument, and not to be used as a place of public worship, any ruinous disused ecclesiastical structure which by reason of its architectural character or antiquity is deemed worthy of preservation." The same section empowered the Irish Church Commissioners to pay to the secretary of the Board of Works out of Church funds the sum that might be necessary for maintaining the structure. The groups of buildings so transferred are 137 in number. The sum of 50,000*l.* was handed over to the Board of Works and invested for their maintenance.

The expenditure on commencement of this year on works of restoration, salaries, &c., as shown by the Blue Books, amounted to a total of about 35,000*l.*; and the interest on the balance of stock is all that is now available to pay for the necessary work of preservation and other expenses, including the salary of a superintendent (Sir T. N. Deane), appointed by the Treasury. The expenditure on salary, travelling expenses, caretakers, &c., amounted to above 400*l.* per annum, and the sum available for expenditure on works of preservation is probably a little over 400*l.* per annum. An additional salary of 50*l.* has been granted to Sir T. N. Deane in respect of monuments placed in charge of the Board of Works under the Act 45 and 46 Vict., cap. 73, 1882, commonly called Sir John Lubbock's Act, the maintenance of which is provided for in an annual vote by Parliament. The amount granted for the latter works ranged from 150*l.* to

250*l.* annually, but the expenditure for a few years seems to have been nominal.

In a communication from the Inspector for England to Mr. Romilly Allen, the former suggested the formation of local committees for the purpose of finding what monuments it would be most desirable to deal with, and in "Y Cymmrodor," vol. xi, p. 10, Mr. Romilly Allen, referring to the defects in the lists, says:—"I have always maintained that a general archaeological survey of Great Britain by Government should have preceded, and not followed, the introduction of a Bill for the Protection of Ancient Monuments."

The provisions of the Act of 1869 did not take practical effect until the year 1875, when the Board of Works commenced operations at the Rock of Cashel, which was the first structure vested under the Act for the purpose of preservation and future maintenance. Here and at Glendalough, which was taken in hand the same year, the valuable reports and suggestions of Rev. James Graves and other archaeologists were placed at the disposal of the architect of the Board of Works, the late Mr. J. H. Owen, who thankfully received, and as far as lay in his power carried out, the recommendations made by the Society. A special officer was appointed by the Treasury, called Superintendent of National Monuments, to whom was entrusted the duty of advising on all details connected with the operations, and further archaeological advice from the Royal Irish Academy or this Society does not seem to have been required. It was found that a great number of pre-historic and other structures of the greatest interest could not properly be vested under the Act of 1869, which was confined to any ruinous or disused "church or ecclesiastical building or structure," the property of the Irish Church; and as at this time the want of an Ancient Monuments Act for England was much felt, the Irish antiquaries joined forces with their English friends, with a view to passing the Act Sir John Lubbock was engaged in promoting.

DUNDEE INSTITUTE OF ARCHITECTS.

THE opening conversazione in connection with the Dundee Institute of Architecture, Science and Art was held recently in the Victoria Art Galleries, Mr. W. Mackison, burgh engineer, president, in the chair.

The President, in addressing the assembly, said:—"Since the inauguration of the Victoria Art Galleries the successive sessions of the Dundee Institute of Architecture have been opened within these walls. The Councils of the Institute have esteemed this a great privilege, more particularly as the Fine Art Exhibitions have taken place at times suitable for this purpose. The opportunities thus afforded the members and their friends of examining under most favourable circumstances the fine works of art which have adorned the walls of these galleries have always proved sources of profitable enjoyment. The Council was anxious that this meeting should be held as formerly within these rooms, but on account of the immense labour and time required to procure and to appropriately place such a large number of varied exhibits for this the "Old Dundee" Exhibition, opened so auspiciously lately, it was impossible for us to have this conversazione at an earlier date. I am sure, however, you will all admit that the delay thus occasioned has been amply warranted by the deeply interesting and intensely fascinating exhibits by which we are surrounded. Although in this Exhibition we do not have so many works of living artists as in former years, still we are in the midst of an extensive and valuable collection of ancient articles, curios, relics, old paintings, and works of art illustrative of Old Dundee, and commemorative of many of its departed citizens and outstanding personages, who have so ably played their part in raising our city to its present position. We must acknowledge that within these galleries there is a collection not only unique in its conception, and rare, varied and characteristic in its exhibits, but also one which is fitted to entertain, interest and instruct. Nay, more, we have a splendid illustration of what can be done by the indomitable enterprise and perseverance of Dundonians of to-day. All praise is due to those gentlemen who have brought this magnificent Exhibition of "Old Dundee" to such a successful issue; and, on behalf of the Institute, I now desire to convey to them our best congratulations and thanks, and to express the sincere hope that the citizens will unite heartily in their efforts to make this Exhibition an entire success. In stepping out upon the ninth year of the existence of our Institute, I am glad to announce that it moves steadily forward. The success which has marked its past history has not only exceeded the expectations of its promoters, but presents encouragements for a still more prosperous future. The earnest and well-considered efforts of our past Presidents and Councils, the continued sympathetic co-operation of its members and friends, and the steady and valuable support of the local press have one and all combined to promote the welfare of the Institute. The recent affiliation of our Institute with the Royal Institute of British Architects has

already induced a number of the young men in this district who have entered the architectural profession to commence a systematic course of education tested by progressive examinations, in order to qualify themselves for being registered as probationers, students, and associates respectively of the Royal Institute of British Architects. Ten candidates have already passed the preliminary examination, and are registered as probationers. Whilst these are preparing themselves for the intermediate examination to be registered as students, I trust many others will follow their example and come forward for the next preliminary examination. These courses require very diligent and thorough study, and are designed, by careful preparation on the proper lines, to stimulate independent thought, and to lay a foundation of artistic and scientific knowledge on which to cultivate any natural aptitudes or gifts. The Institute of Architects bestows annually many valuable prizes and studentships, and as its transactions are now to be found in the Library of our Institute, those of our members who devote their attention especially to this department will have a better opportunity of studying the best principles and most recent practice in the art and science of architecture. In passing, I may just remind you that the Soane Medallist of the Royal Institute for 1849 was our esteemed first president, Mr. James Maclaren, and that when I was elected a Fellow of the Institute of Architects in 1865, the late Mr. David Bryce, of Edinburgh, was at that time the only other Fellow in Scotland. You will thus observe that the connection of Dundee with the Institute is not one of yesterday. Our recent alliance will, I anticipate, not only stimulate our young men in their work, but also open up valuable channels for their future advancement and success. This session eight prizes have been offered for competition, and, as the subjects are of a varied character, the Council will be disappointed if there is not a hearty response. An additional prize has this year been offered for the best landscape in oil, with the view of inducing a greater number of the ladies to take part in the competitions. Although the departments of photography and modelling in last year's competitions did not receive the attention expected, there was, however, an encouraging improvement in the architectural and antique departments, in the latter of which a young lady was for the first time a successful competitor. It will, no doubt, also be encouraging to some here to know that one of the young gentlemen who was successful in the competition for the best architectural measured drawing has been offered a liberal commission by an Edinburgh architect for a duplicate of his drawing of the Royal pew, Scone Church. I would strongly commend these competitions, knowing well that everyone who competes will, by the practice and experience thus obtained, be amply rewarded, although not honoured by securing the prize. The lectures have all along been of a most diversified, instructive, entertaining and practical kind, many of them being fully illustrated by diagrams and limelight views. The excursions to places of interest still continue to form a fruitful source of attraction, instruction, social intercourse and recreative study. Last session we were favoured by being admitted into Scone Palace and grounds, a privilege which, but for the nature and object of our Institute, would not have been secured. We were likewise enabled to visit museums, churches and places of interest in the neighbourhood of Perth, and in the districts of Auchterhouse, Newtyle and Meigle, on all of which occasions the excursionists received the most cordial and considerate reception. You may confidently rely on every effort being put forth by the Council to make the forthcoming excursions as interesting, enjoyable and profitable as those in the past; and I have no doubt that our local papers will continue, as heretofore, to favour us with full, popular and realistic accounts of our trips. We have cause for congratulation that so many ladies are now enrolled as associates, and I trust their number will increase, as they have all along taken an interest in the work of the Institute; and we need not be surprised at this, when we remember that ladies are now everywhere found engaged in the pursuit of higher education. In this connection it may be interesting to note that the architect of the "Women's Buildings" in the great Chicago Exhibition is a lady. The local Association for the Promotion of Technical and Commercial Education, on whose Council the Institute is represented, has done and continues to do excellent work in guiding and encouraging systematic courses of study. The Dundee University College is, through its able and energetic professors, making its influence felt in our midst, and, along with the other educational institutions of our city, gradually raising the standard of education and creating a desire for more advanced and thorough knowledge. The present facilities for acquiring knowledge should therefore be taken full advantage of, as success in any profession or business is now becoming less and less a matter of chance, and more and more a matter of skill. In consideration of the attention presently being given to the question of slum dwellings, it may not be inopportune for me to state that during the twenty years since the passing of the Dundee Improvement Act I have been engaged in clearing out numerous areas of Old Dundee, with their narrow streets and closes, thickly studded, dilapidated,

high, dingy, insalubrious, overcrowded and insanitary buildings, and in laying out and forming new and spacious streets and building lots, upon which improved modern buildings have been and are still being erected. This work has been followed by a marked improvement in the appearance and health of the town and by a large reduction in the death-rate. In connection with the work of demolition, the greatest credit is due to Mr. A. C. Lamb for the great care and trouble he has taken to preserve, by drawings and photographs, the quaint features of the old town. Notwithstanding all that has been done by way of improvement, there is still room for similar work being carried out in various parts of the city. The improvement of the slums is a difficult and complex process, and requires very careful consideration. There are deeper reforms that must go along with the shutting up or remodelling of the slum dwellings and the providing of good and suitable houses for the working classes, and these must take effect, not only on the habits of the people residing in such localities, but also on their moral and spiritual life. It is not an unusual thing to find single-roomed houses side by side, having common external arrangements, but yet internally quite dissimilar as regards the tidy, smart, and comfortable appearance of the one as compared with the filthy, slovenly, and miserable condition of the other. Now, why is this so? Simply because of the difference between the habits and characters of the respective occupants. In like manner new houses would soon become slum dwellings if nothing were done to improve the morals and habits of the people. The Dundee Police Commissioners have for some time past been prosecuting the work of shutting up or causing to be remodelled houses unfit for human habitation, and they have already effected a considerable improvement in various parts of the city. During nearly twenty-five years' experience of this annually changing body I have never found it lacking in zeal for the public good, nor wanting in determination to keep abreast of the times. As this is an age of rapid progress and continual change, architectural, scientific, and artistic works are consequently affected thereby in many ways. New materials are coming into use; the applications of existing materials are being varied and multiplied; new forces and agents are being developed; and the tastes and methods of the people are rapidly changing. All these combine to tax the knowledge and ingenuity of the architect, the ability and skill of the tradesman, and the taste and originality of the artist. Surely, then, this is a strong reason why we should put forth our most strenuous efforts to advance the aims and objects of our Institute.

Mr. Blackadder proposed a vote of thanks to Mr. Mackison, which was heartily accorded. A musical programme was then gone through. During an hour's interval the company enjoyed a "walk round" the "Old Dundee" Exhibition, and in one of the small rooms tea was provided. Mr. Mackison, who proposed a vote of thanks to the performers, remarked that he had received a letter of apology for absence from Mr. D. J. Macdonald, president of the Mechanical Society, in which he said that the Institute of Architecture, Science and Art had so many things in common with his Society that he thought the two should be more firmly united. He (Mr. Mackison) had it in view to speak on that subject in the course of his address. He held that there were many associations in the city that might affiliate with advantage at the same time that they met in sections and carried on their particular work.

RAILWAYS IN IRELAND.

THE annual general meeting of the Institution of Civil Engineers of Ireland was held in the new hall, 35 Dawson Street, on the 4th inst. The president, Mr. John C. Smith, delivered his inaugural address, in the course of which he congratulated the society on the success of their efforts in procuring their new hall for their meetings, and thus being no longer dependent upon their friends in Trinity College. The Institution seemed now firmly established, but in order fully to discharge its functions the Institute should be fully representative of the profession in Ireland. There were still some practising engineers in the country who were not members of any institution. Others were only members of the Institution in London, but how could they expect that latter body to give particular care to Irish matters when only 115 of their 5,400 members belonged to Ireland? The future of their Institution must mainly depend on the future of Ireland herself. If Ireland prospered their Institution would prosper; therefore he was about to speak on a subject intimately connected with this mutual progress. The President then referred to the railway rates, in reference to which he said it had greatly encouraged him in the study of the matter to find that a reduction of railway rates would be thoroughly in accordance with ideas expressed more than half a century since by Thomas Drummond, whose services Ireland had not yet forgotten. In the report on Irish railways of 1838 Drummond gave his conception of the policy which should be pursued by Great Britain towards the people of Ireland in these

words:—"To afford the means of present employment to such a people, and at the same time lay the foundation of their future prosperity and improvement, is surely an object worthy of a wise and great nation, and will not be opposed from any narrow and short-sighted views of economy. The interests of these countries are so inseparably interwoven that nothing which concerns one portion of the United Kingdom can be alien from the rest." Drummond foresaw how necessary it was for the prosperity of any country to possess a system of railways adapted to its requirements, and accordingly he set himself with all his might to procure such a system of railways for Ireland. Parliament adopted a resolution that commissioners, subject to the approval of the Treasury, should fix the rates of carriage on the railways. After Drummond was gone his ideas were safely shut up in the pages of a Blue Book, and so it came to pass that the railways in Ireland were committed to the direction of individuals almost unconditionally and without control. To carry out his idea Drummond required assistance from the State, and asked for it on the ground that the State would receive enormous profit on the greatest contemplated outlay, and he cited and estimated for the increase to the public revenue which would arise in the "article of excise." Between the time of the commencement of the additional taxation in Ireland and the time of the latest returns the wealth of Great Britain assessed to income tax had increased to over 100 per cent., and the taxation only by some 60 per cent. In Ireland the taxation had increased 60 per cent., but the wealth assessed by income tax had only increased by 25 per cent. It was clear that had Drummond's proposal been acted upon, had Ireland enjoyed during all those years the full and entire benefit which their railway system was capable of affording, such an impetus would have been given to the development of her material resources that her wealth would have increased by far more than 25 per cent., and might even have reached the percentage achieved by Great Britain. Had this been accomplished the unbalanced taxation of Ireland would have vanished. On the basis of figures supplied by the Treasury Parliament might so have regulated the national finances as to leave a substantial surplus of Irish revenue, and might have applied that surplus in the reduction of railway rates in Ireland, and so conferred a solid benefit upon practically every portion of this country and every member of its population. The Royal Commission of 1888 in its report mentioned the desirability on public grounds of reducing railway rates in Ireland, but condemned the plan of State purchase, and proposed in lieu a State guarantee to the companies. The question of the reduction of rates had not yet been brought before Parliament, but when the time came for that they might be confident that the people of Great Britain would justify Mr. Drummond's noble words, and would act in a manner "worthy of a wise and a great nation."

GOBELINS TAPESTRY.

A REPORT of the United States Consul-General in Paris on French tapestries gives some interesting information in regard to the famous Gobelins factory. It was founded in 1607 by Henri IV. in the scarlet dye works originally established in the fifteenth century by Jehan Gobelins. In 1662 it was bought by Louis XIV., on the advice of Colbert, and formed into the "Manufacture des Meubles de la Couronne," with 800 workmen directed by the most celebrated artists. After the death of Louis XIV. the factory reverted to its original work of making tapestry only. The national factory of Gobelins is now divided into three sections, dye shops, tapestry shops and carpet workshops. The first not only produce every colour, but twenty or thirty shades of each. The execution of the tapestry is so slow that an artist cannot produce more than a fourth of a square yard in a year. In 1826 the manufacture of carpets was added. These are remarkable for their softness and the evenness of their tissue. Some of them take five to ten years to produce, and cost from 60,000 frs. to 150,000 frs. Several tapestries of special importance exhibited at the Gobelins are mentioned by the Consul-General. A portrait of Louis XIV. by Rigaud is considered the *chef-d'œuvre*. A special account of the method of making the tapestry, by Mr. Debray, an expert, is also given in the report. This gentleman says that the value of Gobelins is on the average 3,000 frs. to 4,000 frs. per square metre, while that of the Beauvais tapestry is as much as 7,000 frs. The characteristics of Gobelins are large historical scenes and reproductions from celebrated paintings. Sales to private persons are only permitted by the special authority of the Minister of Fine Arts. To the Gobelins factory is joined the carpet factory of La Savonnerie (the building in which this work was first commenced was originally a soap factory), in which velvet carpets, reproducing historical and mythological subjects, are manufactured in the same way as velvets. The artists at Gobelins receive very high salaries. Hand-loom

only are employed, and tapestries of the ordinary dimensions require on the average three years. The manufacture of silk tapestries at Nîmes has been declining since 1750, and there, as at Aubusson, it is in private hands. At Beauvais as well as Gobelins the manufacture is controlled by the State. Cotton warps, called *boyaux*, are employed; the weft is of twofold wool, and is a species of Australian mohair wool, denominated *laine brodé*, its characteristic being that it is open and firm. The wefts are dyed by expert chemists and dyers, by the old method of wood dyes, such as indigo, cochineal and curcuma. Part wool and part silk tapestries are also manufactured, and a limited number all silk.

GENERAL.

The New English Art Club has lost the following members by resignation:—Messrs. J. J. Shannon, H. S. Tuke, Jacomb Hood, Theodore Wores and Alexander Mann.

At the Birmingham Art Gallery the large loan gallery is now being rearranged with the permanent pictures and a small but fine loan collection, consisting of works by Alma-Tadema, R.A., J. C. Hook, R.A., J. F. Lewis, R.A., Marcus Stone, R.A., Peter Graham, R.A., Vicat Cole, R.A., J. B. Burgess, R.A., James Holland and F. Goodall, R.A., &c.

The Exhibition of Works by living English animal-painters, which Mr. Whitworth Wallis got together in the Birmingham Corporation Galleries, closed on Sunday last.

The Associates of the Royal Society of Painter-Etchers elected on Friday last are Miss Susan Crawford, Miss Jessie Harrison, Miss A. Williams and Hubert Schröder. Mr. W. Holmes May has been appointed hon. treasurer.

A Collection of Drawings and Photographs illustrating "Architecture and the Allied Arts" will be comprised in the ensuing exhibition of the Glasgow Institute of the Fine Arts. A room has been set apart by the Council of the Institute for this purpose, and a committee of architects formed to make arrangements for the exhibition. Drawings intended for the Architectural Section will be received up to the 25th inst.

Professor Baldwin Brown read a paper on Wednesday to the members of the Edinburgh Architectural Association, entitled "Bronze Doors, including those of Southern Italy."

Mr. J. Macvicar Anderson has been selected by the St. Pancras Vestry to act as assessor in the competition for the proposed municipal buildings.

The Clothworkers' Company have given 3,000*l.* towards the building fund of the Northern Polytechnic Institute, by which the company's contribution is brought up to 5,000*l.*

The Convalescent Home at Cookridge, Leeds, is to be enlarged, as a memorial of the late Canon Jackson, and the subscriptions towards the cost now amount to about 3,000*l.*

The Salt-water Baths at George's Pierhead, Liverpool, are to be reconstructed and enlarged.

The Bradford Corporation have decided to proceed with the Nidd waterworks scheme. The probable expenditure will be 550,000*l.*

The Communal Administration of Vienna offer two prizes of 10,000 florins each, three prizes of 5,000 florins, and three of 3,000 florins, for the best schemes for transforming a part of the city. The time allowed for preparation is until November 30.

Professor Mackay, of the Liverpool University College, will read a paper entitled "The Teaching of Architecture in the New University" to the members of the Liverpool Architectural Society, at the meeting to be held on Monday, the 16th instant.

Mr. Wyatt Papworth has been appointed conservator of the Soane Museum in Lincoln's-Inn-Fields.

The Edinburgh Architectural Association has removed its quarters from 42 George Street to the Royal Institution, Princes Street.

The Southport Town Council have resolved to borrow 22,000*l.* for further improvements on the foreshore. The scheme includes a marine drive nearly a mile long, the union of two marine lakes, so as to give 50 acres of boating and bathing surface, and the enclosure of 80 acres of sand for recreation purposes.

The Stafford Town Council have under consideration the provision for the borough of a costly scheme of deep drainage, which is to supersede the old "pan" system at present in use. The system of sewers will be designed to meet the requirements of a population of not less than 40,000, and the cost is estimated at from 40,000*l.* to 45,000*l.* While the work of laying the sewers is being proceeded with, it is proposed that investigation should be made as to the various systems of chemical treatment.

The Local Government Board will to hold an inquiry relative to the application of the Halifax Corporation for sanction to borrow 100,000*l.* for gasworks purposes and 14,000*l.* for works of sewage disposal.

The Architect.

THE WEEK.

BUILDERS and contractors who seek after municipal offices will be wise if they weigh the words they employ in the course of electioneering campaigns, for promises given under excitement may become binding on them. A contractor for painting in Plaistow discovered on Monday that, through a few words spoken to a workman when he sought a seat among the West Ham Town Council, he will be compelled to pay an extra halfpenny and in some cases a penny an hour to his employes. In Plaistow and Stratford he was in the habit of paying $7\frac{1}{2}d.$ an hour, and in East London $8d.$ He sought corporate honours in October, and a deputation of workmen asked him whether he would pay an increase of wages under the award that was about to be acted on, and by which mechanics and workmen were to receive an extra halfpenny per hour. As became a candidate, he agreed. After the election one of the deputation found his wages were calculated at the rate of $8d.$ an hour, and he gave notice that he looked on the amount as no more than part payment. The contractor was obdurate, and a summons was taken out to recover $1s. 0\frac{1}{2}d.$ In his defence he said that he considered he was acting up to the letter of the award by increasing the rate of wages from $7\frac{1}{2}d.$ to $8d.$ In a district that is partly town and partly country probably metropolitan prices are not universal, and as the contractor had paid two rates, we suppose he considered that he complied with the requirements by raising the lower scale and having a uniform rate. But the magistrate was of opinion that the current rate of wages in the district at the time the promise was made was $8d.$ an hour, and therefore the rate which should be now paid was $8\frac{1}{2}d.$

THE sub-committee charged with the formation of a county museum for Buckinghamshire have issued a statement about the scheme. A site was selected in Aylesbury. It was formerly occupied by a brewery, and stands detached. The price was $550l.$ A building erected on the spot could be seen from the market-place. Mr. ROBERT RAIKES prepared plans, and he estimated the cost of the three sections at $2,000l.$, $1,400l.$ and $1,800l.$ respectively. It would also be necessary to provide for furniture, heating, salary of curator, wages of caretaker, &c. The arrangements were approved by the provisional committee. Afterwards the sub-committee discovered that a far more eligible site than the one proposed was to be sold at a very moderate price. This is the historic property known as the Prebendal. It consists of a large, substantially-built house, and about four acres of pleasure-grounds, with fine old timber, which would be a most important addition to the museum, opening up all kinds of possibilities, and in any case they could not fail to be an immense boon to all residents and visitors. The price asked for this property is $5,000l.$ This is upwards of $900l.$ less than would be required to complete the other plan, and in the end means four acres in the best possible situation, instead of a circumscribed area, in a less perfect situation, of about 90 feet by 30. A portion of this outlay could be undoubtedly recouped by selling or letting certain outlying plots for building and by letting some of the outbuildings. The offer extends only for six months, so, to prevent the opportunity being lost, it is imperative that whatever is done in the matter be done at once. As the proposed museum is not to be an imitation of the apothecary's shop in Mantua, to be fitted with stuffed alligators and ill-shaped fishes, but is to illustrate the history, archæology, botany, manufactures, &c., of the county, the project deserves generous support.

THE "timbering" of mines has answered so well when properly carried out, there is some novelty in a proposition which was brought before the Manchester Geological Society at the last meeting in Wigan, and which advocated the substitution of steel or iron girders for supporting the roofs of workings. The author was Mr. I. JOHNSON, who has had a long experience. He found that, although the cost of iron and steel in the first place was about three times, its life was at least six times that of timber, and there was pro-

portionately less risks of falls of roof, whilst when the road was done with the materials could be used again, or if they had to be sold they would at least fetch scrap price, whereas timber when broken was worthless. Considering the price of labour, and the danger of taking out old timber and fixing new, which was very costly, apart from risk, he was convinced that the use of steel and iron for the securing of main roads was decidedly preferable to timber. In the discussion which followed, the general opinion was expressed that steel and iron girders and props were excellent when there was no moving weight in the roof, but where there was a moving weight the supporting of the roof could be done much better with timber. The conclusion arrived at was partly inspired by the conservatism which prevents the introduction of many improvements underground. When it is remembered that iron and steel are now obtainable at most moderate prices, girders should be employed more often than they are at present.

WHEN the officers of the National Gallery in Edinburgh failed to appreciate Mr. ORROCK's gift of water-colour drawings he advised him to remove them and send them to Glasgow. That course has been followed. The fifteen drawings have been accepted with gratitude, and although Mr. ORROCK may not have the satisfaction to feel that his drawings are of use in his native city, they will at least afford gratification and instruction to others of his countrymen. There are two drawings by GEORGE BARRET; two by JOHN VARLEY, four by DAVID COX, four by PETER DE WINT, one by WILLIAM HUNT, one by GEORGE CATERMOLE, and one by R. P. BONINGTON. Mr. ORROCK is in hopes that he will be able to add an example by TURNER.

WILLIAM HUNTER, like his brother JOHN, was one of the lawgivers on medicine in the last century, but his enthusiasm did not lead him into unprofitable pursuits. He was wealthy, and he was enabled to enrich the University of Glasgow by a bequest of medals and coins, as well as manuscripts, rare books, shells and anatomical preparations. A building was erected to contain them, at a cost of $12,000l.$ WILLIAM HUNTER was particularly shrewd in all his dealings, and whatever he purchased was likely to be precious. It cannot be said that his gifts were appreciated. University students are not disposed to go beyond their curriculum, and, except out of curiosity, the HUNTER collections have not been utilised by the class for whom they were intended. The authorities of the University of Glasgow have observed the indifference, and recently they obtained power to sell the Hunterian collection of coins or any part thereof, and to apply the proceeds to the maintenance or extension of the Hunterian Museum and Library, or of other libraries and museums belonging to the said University. The scheme does not meet with the approval of the citizens of Glasgow, and the Town Council have decided to protest against the dispersion of the collection. It is also proposed to offer adequate accommodation in the new Art Galleries for the coins, where they would be accessible for inspection and study. We suppose there will be no difficulty in acceding to the desires of the Corporation. The study of old coins may not appear to be of much advantage to the citizens, but it is an innocent recreation in the intervals of utilitarian pursuits. As long as archæology is tolerated, coins must be considered as forming a part of it. Hereafter there may be more interest taken in the study, and it would be well for Glasgow to provide for that time.

WE have stated that a novel exhibition was to be held next year in Belgium. Part of it was to be seen in Brussels and part in Antwerp. The people of Antwerp are not over friendly with their countrymen in the little capital, and it has been found that the success of an exhibition must be imperilled which depended on the co-operation of the two cities. Moreover, in a contest between them Brussels always has to succumb. It is only nominally that its claim to precedence is admitted. The exhibition of 1894 will, therefore, be held in Antwerp. A guarantee fund towards expenses, amounting to $1,500,000$ frs., has been subscribed. There may be some difficulty in finding a suitable site, for to set up buildings at the outskirts of the city would be to court defeat.

ARCHÆOLOGY IN IRELAND.

IN all countries the study of archæology should be encouraged. Whatever theory of life may be adopted—the old one of degeneracy from primitive perfection, or the later one of progress from a lowly original—the value of relics of the past is alike incontestable. We may be doubtful about the truth of an ancient document, for it must be feared that annalists were prone to allow their imagination an abundant license. But the qualities of an ancient building, or the skill shown in a carving or a piece of metalwork, a coin, a painting or an illumination, cannot be gainsaid. We have obtained an acquaintance with the ancient life of Egypt through paintings, buildings and sculpture. If the histories and even the literature of Greece were razed out, it would still be possible to realise many of the characteristics of the people from the architectural remains and the sculpture.

In Ireland archæology deserves attention not only for the same reasons which prevail in other countries, but for political reasons also. The people are fascinated by the past. Through a strange sort of instinct it comes quite natural to an Irishman to believe in the ancient greatness of the island. All he reads about modern state in kings' palaces seems to him to be only commonplace performance if compared with the great ceremonies which took place in the palaces of the old kings. There were a great many kings in ancient Ireland, and it is concluded that they were surrounded by magnificence which surpassed all precedents. But what is more extraordinary, it is supposed those kings were not selfish. In some mysterious way all their subjects were enabled to share in their greatness and wealth. It might be thought from what is said that the ancient Irish principalities were a sort of partnerships on an enlarged scale, in which wealth was produced by means that are now unknown, and was most equitably divided among all classes. How so strange a delusion originated it is easy to understand. Old families in Ireland were in the habit of retaining bards, story-tellers and scribes, whose business it was to celebrate the greatness of their lords. Accordingly they seem to have entered into a sort of competition in the production of amazing legends. Efforts of the imagination, which in other countries were accepted at their true worth, but which were as unrelated to reality as "The Arabian Nights," in Ireland were associated with individuals, and come down to us as if they were records of events which had occurred. Another cause was the marvellous wealth of words which those retainers in families possessed, and which they loved to display, and therefore made opportunities for displaying. One example will illustrate the peculiarities of the word-painting of those gentlemen. In most countries it denoted a very early stage in civilisation when horses were employed in battle. The primitive charioteers formed a sort of military train, but the chariots did not excite any more amazement than other utilities. HOMER does not go into detail about the chariot to which HECTOR was attached, nor those which were used in the races which were part of the funeral of PATROCLUS. The poet's thoughts were concentrated on heroes. The ancient Britons also were able to employ chariots, but no fuss was made about their appearance by the bards. Now let us see how an Irish war-chariot was described:—

Then did the valiant champion spring into his armed battle chariot, with its thin swords, with its hooks and hard spikes, with its champion-bending spears, with its open machinery, with its galling sharp nails, which were disposed on the axles, and straps, and shafts and ropes of that chariot. Thus was that chariot: with its thin [close] dry entrance to its body, high-mounted, straight-shouldered, champion-like, in which would fit the arms of seven chiefs; with the fleetness of the swallow or of the wind, or of a fox over the course of a plain. That chariot was yoked upon two fleet, bounding, furious steeds; with small heads, small tufts, small legs, sagacious, broad-hoofed, red-breasted, switch-tailed, streaked, easy yoked, easy of motion under the splendid timbers of the car. One of these was swift, fleet-bounding, of great action, of flowing mane, vigilant, entire; the other steed, curly-maned, slender-legged, long-legged, narrow-hipped, &c.

The chariot on which so much magniloquence was wasted was probably as rudimentary in construction as the low-backed car which LOVER sang. A similar rule was followed in other descriptions. Everything which was in any way associated with a chief or a master was aggrandised by scribes. In consequence it is impossible to rely on any

description by a native of any animated or inanimate thing which existed in ancient Ireland.

The remains of antiquity which are to be seen in Ireland, or which are occasionally discovered, vary so much in value as to compel us to conclude that skilful artists and craftsmen were never very numerous in the island. Some examples of illumination and of metalwork are beautiful. But the architecture that is not of English origin is hardly equal to that of the Greeks. The carving on the buildings was produced without any regard to decorative principles.

The archæological importance of the buildings and their sculpture, or any other class of work, is not diminished by the deficiency of ability to express the beautiful. Although they may not rank high as works of art, they are still interesting as evidence of the efforts of a people to overcome difficulties. If we accept the records about the learning of Irish scholars, and the efforts they made to civilise the continent of Europe, a new interest is attached to Celtic works in stone, which compensates for their defects. For they demonstrate to us how book-learning can co-exist with the most humble ability, as artists. But with a people who are unable to judge of things as they are, it is not enough to leave defective ornament to speak for itself. Under the influence of the mysterious glamour by which perfection is sought in the past, the Irish people continue to conclude that barbaric forms and rude construction are unsurpassed by any modern productions of man's hand.

At one time there used to be a class of instruction which was known as philosophy. It has fallen into disrepute. Nobody cares now to talk about the philosophy of history, and a successor to MARTIN CHUZZLEWIT would no longer hear in an American boarding-house about lectures on the philosophy of vegetables, philosophy of crime, philosophy of the soul and so on. But there is a need for somebody to enforce a philosophy of archæology in Ireland, to explain the shortcomings of the majority of ancient examples of all classes, and in a word to endeavour to make the people judge by their reason instead of by their imagination. In suggestiveness Irish work stands almost as low as what comes to us from the South Sea Islands. It is not only imperfect; we feel that the men who produced it might have done better, but were too indifferent or too much afraid of trouble. The late Professor WESTWOOD, who, like some of his pet insects, was endowed with a microscopic eye, considered the manuscript known as the "Book of Kells," which is in Trinity College, Dublin, to be the most beautiful in the world. It is an example of painstaking labour, but it has been entirely fruitless. The contemporaries of the artist were not inspired by it to produce more elaborate illumination, and certainly at the present day no ornamentist would dream of going to it for a hint. We admire the patience which is visible in developing the principal letters, but there is not one element of the decoration which suggests that the artist used any natural form as a model. The figures have only the most remote resemblance to life, and are dissected according to the whim of the artist. In the last number of the Journal of the Society of Anti-quaries in Ireland there is an instance of the length to which enthusiasm will carry observers. The remains of an ancient doorway are found in the wall of the nave of Killaloe. It is described as magnificent, as "the glory of Clare, for seldom did man of Old Erin work out in stone a design of more beauty." Mr. WESTROPP, an Irish archæologist, gives the following description of it in the course of his article on the "Ancient Palaces and Cathedral of Killaloe":—

It consists of four orders. The innermost has a rich pattern of chevrons and lozenges, the enclosed spaces carved in beautiful designs of converging spirals and leaf work. The right-hand pillar alone remains. The capital of this (as in all the other orders) is fluted with asparagus-like bars in the hollows, the upper part square. The shaft is square, with bold flutings terminating above in lions' heads and below in lions' paws and human feet and some graceful leaves. The bottom block of the left-hand pillar has a small indented stand for the base. The bases in every case have spirals and rude foliage on the cushion-moulding, which rests on square blocks. The next order has a hollowed face, on which sprawl uncouth animals, their tails twisted into the hair of three human heads. The pillars are square, decorated with irregular chevrons, enclosing uncouth struggling animals and graceful foliage. The right-hand pier is entwined in knots of serpents; the capitals have an ear-like ornament, while the left-hand capital has animals. The third order has bold moulded

chevrons ending in a serpent's head; the interspaces are filled with "honeysuckle" ornament, as fine as if designed for embroidery. The capital of the right-hand pillar has a procession of griffins, each holding the tail of the one before it; while the left one has a knot of snakes. The pillars are detached round shafts cut in low-relief in lozenges filled with foliage and flowers. The fourth order has an architrave deeply cut into alternate chevrons and recesses richly moulded and beaded, ending in serpents' heads; the capital of the left pillar has an animal; the right, a beautiful honeysuckle or trumpet device. The shafts are square, with a rich vesica pattern cut into the angles, in curves of alternate beading and fillets.

Now if this work had been found in any other land, Mr. WESTROPP would be likely to say that not one inch of the ornamentation of the doorway was correct. It will be seen from his description that so much variety is fatal to unity in a small work like a doorway. There is so little continuity between the ornament and so much mechanical repetition of the elements, that parts might be removed or extended without any loss or effect. Why should long lines of fluting terminate in lions' heads at one end and lions' paws and human feet at the other? If animals are shown with their tails twisted into human masks, why should the heads lie against the upper line in one part and the lower in another place? The truth is, "the glory of Clare" appears to have been adorned by some man who was incapable to make a design. He got hold of a few scraps from some illuminated manuscript, and with this stock-in-trade he set to work in Killaloe. He expended a very long time in fitting and cutting the repetition of his patterns. We can imagine that the wild warriors who were congregated at Killaloe were surprised at the result. But the time has arrived when the defects of the works should be honestly declared, for as long as such examples of "art" are supposed to be the glories of Ireland, we must expect to see the modern students of art in that country wandering in paths that will not lead to perfection. The true philosophy of Irish archæology would have to show the inferiority of native work when compared with the contemporary work of other people. But the man who professed it would, we fear, have to be encased in triple steel, for imaginative peasants do not like to have their illusions unveiled.

If considered impartially, there is much which is entertaining about Irish archæology. A severe moralist like Mr. RUSKIN must of course object to the angel which an Irish missal-painter represented with red dots in the palms of each hand and circles for eyes, but without any trace of a mouth; but then think of the humour of the idea, the utter indifference to ordinary notions of what should be done, the independence of nature! Why should Irish illuminators or carvers be compelled to obey laws of art which were devised by foreigners? A still more remarkable instance of the peculiar independence is referred to in the *Journal*. There is a family of great respectability in Waterford, known as the BARRONS. It appears they claim descent from the BARRONS of Burnchurch, in Kilkenny. One representative of the family was actually offered a pedigree by the late Sir WILLIAM BETHAM, the Ulster King-of-Arms, who had charge of Irish genealogies. If some half century ago family trees were made out so easily, what must it have been at a still earlier time? Where but in Ireland could be found an University which was created for mere boys of twelve to fourteen? It was necessary to enact statutes against "apple-stealing, drinking, card-playing, frequenting town, fighting, swearing, absence from grace, and many other offences. For breaches of these rules the boys were birched, put standing at the pulpit during meals, put in the stocks, made to make confession for faults on their knees, and for very grave offences expelled." That was the state of the nursery of learning in Dublin under the Good Queen BESS. Subsequently, discipline was at times either too lax or too strict, and riots were of frequent occurrence. Provost BROWN died from a blow of a brick, and a Junior Fellow named FORD was shot in an attack made on his rooms. The early Fellows mixed too much in politics, and LAUD, when Chancellor, said that the college was "as ill-governed as any in the kingdom."

Shooting must have been a very common practice. We find, for instance, that a vestry in county Meath in 1788 passed the following resolution:—"That the constable is hereby directed to shoot any pigs that shall be found

wandering in the streets of Slane or the avenues leading thereto, and that we approve and will support any person or persons who shall put the law in force by shooting any pigs that shall be found trespassing on their fields and gardens." In the town of Ennis wandering pigs were speared by the beadle, and the bodies given to the poor. Why "the gentleman who pays the rent" should have been treated with so much disrespect is not evident, unless his indiscriminate manner of feeding brought danger to the infant population. Pig-sticking is, of course, an Indian sport, and perhaps the Irish may have inherited a love for it from the East. There is, however, more probability of affinity with the East displayed in the practice of burying butter in the earth. In 1650 Sir WILLIAM PETTY, who made the first general survey of Ireland, refers to butter made rancid by keeping in a bog. In the search after antiquities, specimens of butter in wooden vessels have been met with. It is a very common practice in some of the districts in India, and Europeans are willing to pay double the price of fresh butter for what is fermented. From experiments by the Rev. JAMES O'LAVERY, the butter acquires a cheesy taste. He does not enjoy the flavour, but as an archæologist he takes interest in the practice, for as he says:—"Of the branch of the human race that speaks the Indo-European languages, we have the extreme eastern and the extreme western tribes using a common mode of preserving their butter, and to seek the origin of that custom we must go back to the day when the Hindoo and the Irishman were brothers, partaking of the food prepared by the common mother of both—a research which carries us back to the early patriarchs."

The seventh century appears modern if compared with the time when the emigrants of Ireland acquired their knowledge of butter-making in the East. But that century is important, for a great many traditions unite in testifying to the existence of a famous builder of that period—that is, the GOBBAN SAER—a man that, from the feats recorded of him, might have possessed supernatural powers. We are glad to come across a case in which no more is claimed for him than an ability to erect a timber church. In describing the ruins of an old monastery on the bank of the Barrow, in Carlow, the Rev. Mr. FRENCH writes:—

St. Moling having decided on the site, called to his assistance Celtic Ireland's most notable builder, a man whose name and reputation has lasted to the present day, the celebrated Gobban Saer, and he directed him to erect an oratory. We are told that the Gobban, who could construct equally well in wood and stone, erected this oratory of wood, and that the shingles which roofed it were made from the wood of a very remarkable tree. When the celebrated yew tree, the "Eo Rossa," one of the five famous trees mentioned in the "Book of Leinster," fell or was cut down, St. Molaise, or Lazerian, divided it among the saints of Ireland, and St. Moling utilised the portion given to him in making shingles to roof this very oratory, and thus consecrated to the service of God that which had been previously an object of pagan tree-worship. Here we have one of the recorded instances of a church built of wood. There can be no doubt that where wood abounded oratories were constantly constructed of that material; and from a passage in St. Bernard's "Life of Malachy," we learn that "the custom of building oratories of wood was continued in Ireland even to the twelfth century."

It appears St. MOLING was an artist, and a shrine in the library of Trinity College, Dublin, is said to contain drawings of the apostles by him, which are in water-colours.

There is no doubt that good work is being done by the Royal Society of Antiquaries in Ireland, but the members would render still greater services to their countrymen if they exercised their critical faculties. A good many stories (the existence of drawings since the seventh century may be one of them) should be declared to be of doubtful authenticity, although they may have value as legends. In the same way, when remains will not sustain examination, it would be well to point out the shortcomings. The Irish people have such a tendency to see the past through an atmosphere that makes all things beautiful, they are not unlikely to overlook weakness of design and execution. The metalwork of some of the shrines is as delicate as any Indian or Italian filigree, and there is no less patient work to be observed in some of the copies of the Scriptures. But it does not follow that the measure of success attained in the two classes of works should excuse the defects of the Celtic artists when dealing with materials which required a more energetic system of adornment.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, Mr. H. O. Cresswell, president, in the chair. Mr. W. Petch was elected a member.

Mr. R. PHÉNÉ SPIERS, F.S.A., read the following paper

On the Influence of Byzantine Art in Italy from the Fifth to the Twelfth Century.

The archaeological researches of the last fifty years, and the valuable records which have been left to us in the works of Rickman, Professor Willis, Parker, Sharpe, Scott, Street and Burges among our own countrymen, and Viollet-le-Duc and De Caumont in France, have so far raised the veil of obscurity which hung over that period known as the "dark ages" as to have eliminated from its shadow the second half of the eleventh and the three following centuries. Attempts were made by Hope, Dr. Whewell and Professor Willis to carry back the date, but till within the last few years the entire absence of documentary evidence, the want of a systematic study of the fragmentary remains left to us, and a general inclination to ascribe to buildings a greater antiquity than the civilisation of the precise epoch would admit of, has created some confusion and failed to penetrate the mystery of the period I have selected for my paper. The subject, however, is so vast that I have found it necessary to confine my remarks to a portion of one country only, viz. the north of Italy, and to the influence of one particular style only, the Byzantine, in the development of its art.

The two books to which I am the most indebted for my information are De Dartein's "*Etude de l'Architecture Lombard*," completed in 1882, and Cattaneo's work published in 1890, which bears the same title as my paper, except that I have taken another century in order to include St. Mark's and a large series of buildings which illustrate the extensive influence of the Byzantine style in Italy during the twelfth century.

With De Dartein's work I had long been familiar, and, failing other evidence, had acquiesced to a certain extent in the dates given to the various churches illustrated in it. When, however, in the beginning of 1892, I came across Cattaneo's work, and found so wide a difference of opinion, a new interest was awakened, which increased as I followed the arguments brought forward. It was necessary for me to master the facts in order to revise the new edition of Fergusson's "*History of Architecture*," on which I was then engaged, and it occurred to me that it might be of some interest to the members of this Association, and induce those of you who, in future years, have the opportunity of travelling in Italy to carry further the inquiry. I felt, however, that my statements would come with more authority if I were able to visit some of the monuments in question, so as to be able to differentiate the dissentient opinions expressed by the two authors above named, and also to make drawings or procure photographs of some of the more important details, which would enable you better to judge for yourselves. I could not hope to get as far as Rome, but in the months of August and September last I visited Como, Milan, Brescia, Verona, Vicenza, Padua, Venice, Ferrara, Ravenna, Ancona, Bologna, Parma, Piacenza and Pavia, and studied most of the buildings with which the immediate subject of my paper is connected. The Byzantine influence in Pisa and Lucca, and in the south of Italy at Troja, Bari, Bittonto, Altramura, &c., is of an entirely different type, and was inspired by the work of the later Great Empire. In the north of Italy it radiated from Ravenna, and is of much earlier date.

To place my subject clearly before you, I must commence by pointing out the essential characteristics of Byzantine buildings:—First, as regards plan; second, construction; and third, decoration. I shall only be able to touch on the salient points, otherwise my paper would be one on the Byzantine style, which has already been treated by Professor Aitchison at the Royal Academy. When Constantine transferred the seat of empire from Rome to Byzantium, he rebuilt the ancient town, doubling its size. He surrounded it with walls, and divided it into fourteen regiones or quarters. The buildings which he erected consisted of churches, palaces, thermæ, forums, &c., all of which would seem, from the descriptions given, to have been based on those of the Eternal City, with one important difference: they were so hurriedly built, and in materials of so ephemeral a nature, that none of them have been preserved to our day; in fact, many were pulled down and rebuilt by Justinian two centuries later. Two constructions of his time remain—the Bin-Bir Dereh, or cistern of the thousand and one columns,* and the Yeribatan Serai—two large underground reservoirs for storing water. There is one great basilica, built by Constantine, still existing in Syria, viz. the Church of the Nativity at Bethlehem. This church, and those which are described by Eusebius as having been erected in front of the Holy Sepulchre at Jerusalem, and in other

places, show us that the type of plan adopted was not dissimilar to those which Constantine built in Rome, viz. the ancient church of St. Peter, pulled down in 1506, the church of St. John Lateran, which still exists, and others which have been rebuilt since. In all these Roman examples materials from ancient buildings were used up, temples, tombs and other erections being despoiled to provide columns, capitals, architraves &c. for them. The church at Bethlehem is a simple basilica, with nave and aisles, the columns and capitals being clumsier and more debased than any examples could be in Rome. From Eusebius's description, the basilica at Jerusalem had triforium galleries set apart for women, according to the requirements of the Greek Church. And these galleries exist in two basilicas of later date at Thessalonica, the Eski Djuma and the church of St. Demetrius. Both of these churches had timber roofs. From these we pass to the mosque of Sta Sophia at Constantinople, commenced by Justinian in 532, in which the chief feature is an immense central dome, with eastern and western semicircular apses, and with aisles and triforium galleries, all vaulted, surrounding the central space. This church must be looked upon as the apotheosis of the Byzantine style, and no dome of similar size was ever again attempted in the East; but it gave the key to a new plan, which is usually called the Greek cross, in which there is a dome in the centre and barrel vaults over the nave and transept choir. In later times this dome was raised on a drum in which vertical windows were pierced, and sometimes other domes of slightly less importance over nave transepts and choir, or over the four angles included by them. In the church of the Holy Apostles the four other domes were over the nave transept and choir; in the church of the Assumption, at Moscow, on the angles. A second type of plan is found in the round churches, but these do not differ from much earlier examples in Italy; the most important variation, however, is found in the church of St. Sergius at Constantinople, also built by Justinian, a church with octagonal central space covered by a dome, seven semicircular niches, and a choir with aisles and triforium galleries all round. Towards the end of the sixth century, in addition to the central apse in Greek churches, two others were added to contain altars for ceremonial purposes. As they were always hidden by the Iconostasis, they served a different purpose from that in the Roman Church. It is perhaps more a question of construction than of plan; but I may here note that whilst internally in Byzantine work the apse is circular, externally it is almost always polygonal.* In Western Europe it is always circular unless influenced by Byzantine work.

I come now to the second section, that of Byzantine construction. Besides the architects and workmen whom Constantine took with him to Byzantium, he is said to have exported other treasures, and not only bronzes and marble statues, but even columns and capitals. It was evident, however, that these would, in course of time, come to an end, so that he was probably soon obliged to have recourse to whatever materials were at hand. Of timber he had plenty, but there was no stone except of small dimensions, unless it were imported from distant quarries. The means at his disposal were apparently not sufficient to enable him to undertake those stupendous works in concrete, one of which—the Temple of Peace in the Forum—he had completed in Rome, and which still exists in part after fifteen and a half centuries. He was obliged, therefore, to do the best he could with rubble masonry or with brick, the materials for making which were abundant in the vicinity of the new city. De Dartein points out in his work that brick, when employed as the chief material, exercises a considerable influence on architectural design on account (1) of the regularity of its form and (2) of its restriction in construction. It offers great facilities for the employment of arch construction and tends to replace the architrave or lintel. It restricts the projections of cornices, and on account of its numerous joints it suggests the employment of relieving arches supported on piers, leaving the walls to be filled in afterwards as partitions. What may have been the tentative efforts of Constantine and his immediate successors we know not. The buildings of Justinian's reign already mark the invention of a new style of construction; immense arches, measuring sometimes 5 feet high, of brickwork in two or three rings with huge piers and buttresses are employed in the churches of Sta Sophia, at Constantinople and Thessalonica, the bricks measuring from 18 inches to 20 inches by 12 inches, and $1\frac{1}{2}$ inches to 2 inches thick, with joints of mortar of nearly the same thickness and at the extrados of the arch still greater. Even in smaller openings, from 3 feet to 6 feet span, brick arches of 16 inches or 18 inches depth are used instead of two or three $4\frac{1}{2}$ inch brick rims which we employ. (In the campanile of St. Apollinare-in-Classa, Ravenna, I noted a window 6 inches wide with voussours 14 inches deep. In this case special voussours had been made 1 inch thick at one end and 3 inches at the other, the mortar-joints also differing in thickness in the same way.)

* There are actually only 212 columns, and they are said to have been originally quarried for some great building in Rome.

* The exceptions are the Pantokrakon, Constantinople, St. George's, Thessalonica, and the churches in Central Syria.

In the construction of their vaults there is a much more important change from Roman work; and from the fact that the two great cisterns already spoken of in Constantinople were vaulted in the new manner, we may assume that they were built by Eastern workmen, who carried out the traditional method of building domical structures employed by the Assyrians. In these days and here in England, where Baltic timber is to be had in any quantity and at small cost, we do not hesitate to employ centring for every description of arch, centring which afterwards becomes waste timber. In early times, however, they built without centring, and M. de Choisy's book on "*L'Art du bâtir chez les Byzantins*" illustrates a large number of methods by which this could be done.

The vaulting surfaces were always domical, so that when complete each ring was self-supporting, and by building the rings on an inclined plane, with the bricks flatwise and not end-on, each ring was partially supported by the one beneath. This method allowed of a less thickness being given to the vault and reduced considerably its thrust.

Geometrically speaking, whilst the surface of a Roman barrel vault is evolved by a semicircular ring travelling along a horizontal line, in Byzantine vaulting the line rises and is curved. This is only the elementary form, but in its inter-sections it follows the same principle.

The Byzantine architects also would seem to have recognised at a very early period the fact that a pier or support of a homogeneous nature, such as granite, marble or stone, could carry a greater weight than one built up of bricks; and further, that it might even be of less diameter than the wall carried, provided all lateral thrusts were counteracted. Now in all Roman work the face of the architrave, and in late work as at Spalato, the face of the arch, is in the same plane as that of face of column. In the church of St. Paul, outside the wall of Rome, built 388, where arches are thrown from column to column, the thickness of the wall and the width of the base or die from which the arches spring is equal to the upper diameter of the column. In Byzantine work, however, both are much greater. Consequently the Roman capital, with its ordinary abacus, was neither large enough or sufficiently strong to meet the new requirement. They inserted, therefore, a new feature called the dossieret or impost-block between the capital and the wall above. It has been thought this was a corruption of the old Roman architrave. If so its earliest examples would recall the mouldings of same, but in the Eski Djouma, at Thessalonica, dating from the beginning of the fifth century, it appears as an absolutely new and original feature, designed solely to meet a constructional want, and without reference to precedent. It is not necessarily square, and sometimes two of the sides will project like a bracket. The dossieret, therefore, is one of the most characteristic features of the Byzantine style.

I come now to the third head, decoration. Of external decoration, beyond that which is afforded by the courses of brickwork, or by the brick vousoirs, in which variety is given occasionally by difference of tint, and in later work of the eleventh and twelfth century, when patterns of brick or inlaid tiles were employed, there is not much to be said. It was rather in the interior that the Byzantine artist lavished the resources of his art. In the decoration of the lower part of the walls with panellings of the richest marbles, and of the upper portion and of the vaults and soffits of arches with a vast surface of mosaic, the Byzantines carried on the traditions of Roman architecture, but the treatment was new and original. They restricted the carved decorations to those features which had special constructional functions to serve, such as the capitals and bases of the columns, the lintels and jambs of doorways and windows, or such as were required to emphasise certain lines in the buildings as string-courses or cornices. In all these features they were specially reticent as regards their projection, so as not to clash or form too great a contrast with the large flat surfaces of marble or mosaic. Though many of their capitals were based on those of the Roman Corinthian, or Composite orders, we notice a tendency to change, first, the contour of the capital, which inclines for the bell towards the form known as the cushion capital; and second, the leaves, instead of being so much in relief as to suggest that they were in their origin applied to the bell, on the contrary seem rather to emerge from the solid block. These tendencies become the more apparent when, with a cubical block (the lower angles of which had been chipped off to merge into the circular annulet of the column), they proceeded to set out a scheme of surface decoration and cutting back from the surface, to evolve a new variety of design, partially geometrical and partially of leaf ornament. It is in this class of capital that we find the greatest originality, and in the play of light and shade considerable beauty. In these examples also they seem to have been very fond of undercutting. Piercing holes with a drill is found in the debased work of most styles, but the Byzantine artists turned its effects to more account, and frequently employed it in conjunction with carved foliage of good character. The influence of Byzantine design, however, is chiefly conspicuous

in the decoration of the enclosures of choir-screens, parapets of balustrades, episcopal thrones, ambones or pulpits, and baldachinos or ciboriums. To the results of such influence I will draw your attention later on.

Although the early history of the Byzantine style can be carried back two or three centuries before the foundation of Constantinople, its influence on Italy was not felt till the Empire had become well established; in fact, more than a century elapsed before we find it in the ancient baptistery, the tomb of Galla Placidia and the chapel of St. Chrysologus in the Archiepiscopal Palace, all in Ravenna. In these examples it is chiefly shown in the mosaics with which they were decorated, and which were probably executed by Byzantine workmen. The baptistery at Ravenna is said to have been built by Archbishop Ursus in 380 A.D., but this refers, I think, to the main structure which probably was originally covered with a wooden roof. When in 451 it was determined to decorate it with mosaics, the vault was probably built to receive them. There is no documentary evidence of this statement, but the internal structure suggests that a change from the original design has taken place. In order to bring the thrust of the cupola well within the walls, it would seem to have been lined with eight arcades, of two stores which project inwards about 16 inches, and the pendentives are carried or corbels projecting 10 inches more. Now, whilst the exterior of the baptistery shows no Byzantine influence in its brickwork and cornice, three of the capitals which carry the lower arcade inside are Byzantine, and all are surmounted with the Byzantine dossieret. The dossieret appears again on the Ionic capital of the upper arcades, and the width and depth of the springing base of the arches are greater than the diameter of the column. The corbels carrying the main arches and the pendentives are sculptured with Byzantine foliage. Under each arch of the upper storey are three arcades, the centre one pierced with large windows of modern date, the side arcades decorated with niches and figures in low relief, all executed in plaster. I noted these at the time as being peculiar, and subsequently in the museum at Bologna I came across some Byzantine ivory tablets of similar design.

Whilst the mosaics of the tomb of Galla Placidia and probably the dome on pendentives (the earliest example known) are Byzantine. The walls of the building were built by native workmen, and the bricks are much thicker and of less lateral dimensions than those in St. Vitale and other churches in Ravenna of the sixth century.

The next example in date is in Rome, where in the church of St. Stefano Rotondo, in the outer ranges of arcades above the capitals we find the Byzantine dossieret, and a similar feature is said to exist in St. Angeli at Perugia.

The dossieret is found also in that eastern portion of the church of St. Lorenzo fuori le Mura at Rome, where in fact it might have escaped attention, except that its capitals are fine Byzantine examples crisply carved, and they support the arches of a triforium gallery which I have referred to as an essentially Byzantine feature. Except in St. Lorenzo (where they were added by Pope Pelagius about A.D. 585), and in St. Agnes 630, the dossieret is not found in any other basilica in Rome.

For the next important examples I must now return to Ravenna. Ravenna I might point out was selected in preference to Rome as the capital by Honorius in 396 A.D., and from that time for some centuries it was occupied as such by the reigning sovereigns, hence the importance of its buildings. Theodoric, king of the Ostrogoths, who reigned from 493-525 A.D., would seem, architecturally speaking, to have been a very remarkable man, having erected more monuments than even the later Roman emperors. As the Goths, however, had formed no style of their own, he employed such artists as were at his service, and in the additions he made to the Baths of Caracalla in Rome and in the churches he restored there, he insisted on the ancient Roman style being carried out in its integrity. "We owe everything," he said, "to the Roman artists." For the new works, however, which he proposed to build in Ravenna, he imported artists from Constantinople with whose work he was well acquainted, having spent part of his life in the Byzantine capital. The palace which he built, and of which a fragment only remains, is an imitation of the golden gateway by Diocletian at Spalato, but in it we find, perhaps, the earliest instance of the large thin bricks or tiles which are so characteristic of Byzantine construction. Judging by the mosaics on the walls of St. Apollare Nuovo, in which the palace is represented with columns of two dimensions, the general design was Roman. The principal work of his still exists in the great church of St. Apolline Nuovo, a fine basilican church with twenty-four marble columns, said to have been brought from Constantinople, but more probably procured from one of the Greek quarries by permission of the emperor. They carry capitals of debased Byzantine work, and have dossierets carved with crosses; the archivolt mouldings of the arches above them are debased Roman. The entablature which takes the place of the impost mouldings of the responds are so Roman in their execution that they might almost have been taken from some

ancient edifice. They are decorated with console brackets alternating with bulls' head. The existing choir and apse are of later date, though the Byzantine influence is shown in the polygonal exterior of the latter.

We now pass on to the church of St. Vitale, which was built by St. Ecclesius, Bishop of Ravenna, on his return from Constantinople, A.D. 535, the design of which was based on the church of St. Sergius in that town. Except that, in accordance with native custom, the vaults of the triforium galleries and the central domes are covered with timber roofs (necessitated probably by the difference in climate, and this constitutes the main distinction between Eastern and European domes), the whole construction is so Byzantine that it must have been designed by Greek workmen. Owing to the timber roofs over the triforium galleries it was necessary to raise the hemispherical dome higher than in St. Sergius, so as not to interfere with the eight windows with which it is pierced. Whilst in St. Sergius the lower storey of the eight semicircular recesses has columns carrying architraves, in St. Vitale the storey is loftier and there are arches. The capitals of the lower storey are of the same peculiar basket type we shall find in St. Mark's, but they are not so fine in execution, which suggests that they were carved on the spot by second-rate Greek artists, whilst those of the latter were probably imported from the East. The capitals of the upper storey and those of the choir are identical in their design with examples at Constantinople and in Thessalonica. The vault is constructed, for the sake of lightness, with earthen pots fitted one into the other. This system was adopted in St. Stefano Rotondo in the outer aisles, which were vaulted, and in other earlier examples in Rome.

The great basilica of St. Apollinare-in-Classe, three miles from Ravenna, was being erected about the same time, A.D. 535-45. Its capitals are much more clumsy than those of St. Vitale, and although they are based on examples at Thessalonica the design and execution are due to inferior Greek sculptors. The responds of the nave arches are decorated with ornament in plaster; though clumsy, they are vigorous in treatment, and may have suggested the design of the capitals of the court of the Town Hall at Bologna of the fourteenth century. Here and in St. Apollinare Nuovo the soffits of the arches of the nave are decorated with coffers in plaster, which are, I think, of later date—in fact, sixteenth-century work. The archivolts in both churches are in stone, and close copies of Roman work, which suggests that they were worked by native carvers.

The church of St. Agatha is said to date from the fifth century. It is a basilican church with twelve arcades on each side carried on columns. Many of the capitals, however, belong to the sixth century, and were not carved for the church, whilst others are barbarous copies of the eighth or ninth century. The church was about to be restored when I visited it, and the responds having had their plaster surface scraped off, exposed the arches of the original church, which were carried on piers instead of columns. In Rome, where they had abundant resources, they were able to take the columns from ancient buildings, but in Ravenna they were obliged to content themselves with piers unless, as in the three churches before-named, they were privileged by the Greek emperor to obtain them from Greek quarries. Square piers, however, were much in the way, so that probably in the ninth century, when there seems to have been a revival in church building in the north of Italy, the church of St. Agatha was partially rebuilt, and with materials from more ancient structures. Some of the columns and capitals in this church may possibly have been taken from the Palace of Theodore. Four of the columns are in granite. The ancient apse still exists, and is polygonal externally. The height of the springing of the ancient arches was 7 feet 6 inches from the floor of the existing church. I have since ascertained that further excavations have been made, and the original floor of the fifth-century church, laid with cubes of mosaic half-inch square, has been found at a depth of 8 feet below the present church, which is on the same level as the street, so that if we allow 2 feet for the steps entering the original church, the street has risen 10 feet between the fifth and this century. In St. Apollinare Nuovo the base is 18 inches below the pavement, and in St. Giovanni Evangelist the ancient columns lately found about 5 feet; but these two churches may have had loftier flights of steps in front.

There are two or three other churches of early date in Ravenna, such as St. Giovanni Evangelist, a basilica of the ninth century. Some of the columns of the earlier church have lately been found embedded in the west wall, and they are of much greater size and possess much finer capitals than those in the existing church. In all these examples of the fifth and sixth centuries the Byzantine influence is shown in the dimensions of the bricks used, which measure 18 inches to 20 inches long by 12 inches to 13 inches wide and about $1\frac{3}{4}$ inches thick, with mortar-joints of the same thickness. And this gives a style and a character which are quite unmistakable. The apses also when ancient are all polygonal externally. Passing to other towns, the church of St. Lorenzo at Milan was

rebuilt in the sixteenth century, but on the ancient plan. At present it is an octagonal church with four semicircular apses, each with vaulted aisles round them and triforium galleries over. It was originally the cathedral of Milan, and was mentioned in the eighth century as being remarkable for its beauty and magnificence. It is considered by De Dartein to have been originally a square building with hemispherical dome carried on pendentives. If so, it was probably based on Sta Sophia at Constantinople, but, not venturing to throw a dome of such dimension, they increased its size internally by having four semicircular apses instead of two. The diameter of these, however, was only about two-thirds of width of central centre, in order to obtain proper abutment for the arches and avoid the difficulty which had been experienced by Justinian in Sta Sophia; in addition to this they built a tower at each angle. In the beginning of the twelfth century the dome fell in, and it was replaced by an octagonal one, carried on arches thrown across the angles. It was rebuilt in 1575, and, according to the letters of the architect, on the old foundations, but this time additions were made to the angle-piers, which have transformed it into an octagonal church, but as the sides at right angles to the diagonal lines are narrower than the others, there are still arch pendentives above to carry the dome, which is a regular octagon. The church is so enclosed that very little is visible of the external structure: the only tower I could see is built (about 20 feet above the ground) with the Byzantine type of brick I have already referred to.

The church of St. Fidele at Como, of the twelfth century, seems to be based on St. Lorenzo, except that there is a regular nave instead of one of the apses. Triforium galleries also existed except round the eastern apse, where there is only a passage.

So far I have dealt with churches and other buildings. I have now to direct your attention to what I have called church furniture in screens, ciboriums, ambones, &c. There existed prior to 1873 a bridge near Rome called the Ponte Salaro, which was built by Narses, Justinian's general, on the foundations of a Roman bridge. Its interest laid in its showing the Byzantine method of building parapets. Square upright posts of stone or marble are sunk at intervals, the interspaces being filled with slabs of marble which are fixed in grooves worked in the square posts. The posts are sometimes plain and sometimes moulded or sunk in panels; the principal decoration is found in the panels, and those of the Ponte Salaro have designs on them similar to many examples in Sta Sophia and elsewhere.* In the church of St. Clemente, Rome, the enclosure of the choir (which projects far into the nave) is formed of upright mark posts panelled, and slabs of marble which were removed from the more ancient church, the walls of which have been discovered below the existing one. In 1858, when the lower church was discovered, an inscription was found on a marble architrave which enabled M. Cattaneo to fix the date at 514-25, and the sculptural decoration on a column found with it was of the same epoch as the panels of the screen. This parapet or screen is therefore the earliest dated example in Italy of that peculiar interlaced decoration of which so many examples exist in Ravenna, and which was either imported from Constantinople or was carved by Byzantine workmen. Of these interlaced panels there are at least eight in Ravenna; four perfect examples are now in the cathedral, having been preserved when it was rebuilt. Three are in St. Apollinare Nuovo, and one in the museum. There are some in Rome, cited by Cattaneo, and a more diligent research might reveal the existence of others. They are all types of that peculiar interlacing pattern which influenced Lombard architecture down to the end of the twelfth century, and which even up to the fifteenth century in Venice, Verona and other towns near crop up occasionally. The Renaissance parapets in Verona and Venice owe their origin to this simple but highly decorative method of enriching a pierced parapet. The buildings or features which I have already quoted were executed in the fifth and sixth centuries. In 566 A.D. Italy was subject to a series of disasters. The plague, great floods, intense cold, swarms of rats, and clouds of locusts followed one after the other, and in addition to these troubles there were constant incursions of the northern barbarians, followed by slaughter, pillage and general destruction. All this put a stop to the cultivation of art, and either killed off or exiled those foreign artists who with their families had settled in the country. A century and a half passes without the production of any works except of a barbarous character. A revival seems to have taken place in the beginning of the eighth century, when Luitprand occupied the throne of Lombardy. About this time, 720, the first edict of the Iconoclasts was promulgated, and a considerable immigration of Greek artists into Italy took place (it is possible also that the Mohammedan invasions exiled some from Syria); their work would seem to

* Only the Roman foundations and the small Byzantine archway on each side are preserved in the existing bridge, which was rebuilt in 1873.

have been confined more or less to the decoration of apses with mosaics, and to such ornamental works as ciboria or baldacchinos, ambores or pulpits, choir enclosures, &c. Of these the most remarkable are the ciboria at Valpolicella, Cividale, St. Apollinare in Classe, and other places, the greater number of which are now in museums. The most important church built, and which still remains fairly perfect, is that of St. Maria in Cosmedin at Rome, 772-95, and as it was built for the Greeks who had been exiled by the Iconoclast, and is the first example in Italy of a church with three apses, we may fairly ascribe that feature to Byzantine influence, though, as I have before observed, in the Greek Church the side apses are not dedicated to any saint and, in fact, are hidden by the Iconostasis. The church of St. Salvatore at Brescia (the finest work from which is now in the museum there) and the crypt of St. Philaster under the east end of the Rotondo, are the only two structures out of Rome belonging to this century which seem to have retained their ancient plan. They are more numerous in the ninth and tenth centuries. At Rome the church of St. Maria in Domenica is the only one which has preserved its original basilican plan with three apses—I am, of course, only speaking of those in which I recognise the Byzantine influence). The chapel of St. Sativo at Milan, which is like a small Greek church. St. Vincenzo in Prato at Milan, a church which has just been restored, having been closed for more than a century. It is a simple basilica church with nine arcades on each side carried on columns and capitals with dossierets, some taken from ancient buildings and others carved for the church—three apses and a crypt with choir, one rising from 7 feet to 8 feet above the nave. The baldacchino also dates from the ninth century, being somewhat similar to the example in St. Ambrogio. The church of Agliate, near Milan, dates from the same period, consists of nave without aisles. There also is a baldacchino, and it is curious that in all these three, viz. St. Vincenzo, St. Ambrogio, and Agliate, the raised interlaced ornament of the upper portion is in stucco or plaster painted and gilded. The rich archivolt decorations of the narthex of Angiate are also plaster, as also those of the church at Cividale; the church of St. Agatha, St. Francesco and others in Ravenna; portions of St. Eustorgio at Milan (but much altered in the twelfth century); the exterior of the apse of St. Celso at Milan; the apse with triforium gallery of St. Stefano at Verona; the churches of St. Euphemia and St. Giovanni Decollato at Venice, the latter with elliptical arches in nave, which are said to exist in the cathedral of Caorle to the north-east of Venice. This egg-shaped form of arch is one which was largely adopted by the Sassanians, but I have come to the conclusion that the resemblance is accidental, and that instead of tilting the arch at St. Giovanni, to bring its crown on a level with that of the last and wider arch of the nave, they made it elliptical.

The chief interest of all these examples of the ninth and tenth centuries lies in the fact that they constitute the early examples of Lombardo-Byzantine work. The great artists who came over during the Iconoclastic persecution remained only till the end of the eighth century, and the Lombards were then left to themselves to work out their own style. When compared with the finer works of the fifth and sixth centuries at Ravenna, these later examples show a miserable falling off. Whenever possible they utilise old materials, so that in all these churches (which are of the usual basilican type, with nave and aisles separated by arcades, carried on columns, and out of Rome invariably with the dossieret above the capital) we find old capitals used up with a few new ones, of coarse, and naïve execution in imitation of the old examples. The triple apse reigns throughout, and here and there we come across the polygonal exterior to the apse, as in St. Fosca Torcello, at Murano; in the side apsis added afterwards to St. Apollinare in Classe; and the extended one in St. Apollinare Nuova. There is invariably a crypt, which in some cases is only a few steps down from the nave, resulting in a raised choir, as in St. Ambrogio and St. Vincenzo in Prato, Milan. The principal treasures of these churches are the sculptured parapets of the choir, the ciboriums and the pulpits; and in churches of later date, as well as in museums, we find richly-carved slabs, as in St. Abondio, Como, and capitals as in St. Giovanni in Valle, and St. Stefano in Verona, and, although of far less beauty than the earlier Greek examples, exhibiting an interesting and naïve revival of interlaced work, scrolls, and the more favoured patterns of the vine and grapes, which is found in twelfth and thirteenth-century work, and even later.

(To be continued.)

Mr. WOODTHORPE proposed a vote of thanks to Mr. Spiers. He suggested whether the Greek artists when turned out of Italy had not gone to Arles.

Mr. BERNARD DICKSEE seconded. Interlaced ornament, he said, seemed general all over the world. Could it have originated spontaneously?

Mr. C. F. DOLL said Byzantine influence was to be seen everywhere.

Mr. BOLTON said that the Renaissance architects owed much to the Byzantine influence.

The PRESIDENT put the vote to the meeting, and it was passed by acclamation; and Mr. SPIERS having replied, the meeting terminated.

TESSERÆ.

Greek Sculpture.

IN tracing the progress of Greek art it is most interesting to observe how the true mathematical principles of the human head were gradually adopted. In Greco-Phœnician vases that form of profile called Greek is not found, that is, from 700 to 500 years before the Christian era, but from 500 to 440 its gradual advance is observed, while from 440 to 300 the principle of the straight line is acknowledged in the human profile—a principle the Greeks never departed from, and in time, by the constant study of the human figure, they decided on the rules, the laws and proportions that are essential to the production of a perfect form. In no country in the world can this gradual advance of Greek art, from its commencement to its highest degree of perfection and from thence to its decline, be more advantageously studied than in England. In the matchless collection of priceless specimens contained in the British Museum its progress can be followed step by step, from the early period with its stiff draperies arranged invariably in straight lines and its angular forms and movements of the human figure, to the dawn of intellectual art that makes its primal appearance in the figures of the pediments of the temple at Ægina, but still not venturing to discard the stiff folds of the drapery and somewhat constrained movements in the action of the figure. At length forms of truth and beauty burst upon us with all the splendour of a meridian sun in the perfected and stupendous works of the immortal Phidias, the glory of the Parthenon and the wonder and the law of all succeeding ages, till in the Ephesian temple of Diana and the mausoleum of the Carian king the glories of Greek art are seen setting in clouds of unsurpassed brilliancy and grandeur. Thus faded out of sight the great school of form, appearing in faint flashes of reflected light from time to time, now lost in unutterable gloom and again springing up and assuming almost its ancient glory, to be followed by almost a total darkness. But the laws remain, and if ever the great art of sculpture should be destined to revive again it must upon these lines be based.

Art and Civilisation.

As long as the disunion and anarchy which succeeded the ruin of the Roman Empire endured there was little opportunity for the development of the arts. We find that immediately the discovery of gunpowder and the invention of printing rendered social organisation somewhat more possible and a general object of desire, the arts of design, as no inconsiderable instrument towards the promotion of this end, burst into vigour, and we find them so early as the fourteenth century a principal source of popular instruction in Italy, and one of the chief links of union between the people and their governments. The productions of the fifth and immediately following centuries were rather the feeble endeavours of an expiring than the vigorous efforts of a new age.

Niello.

The transition from engraving on wood to something competent to bear a higher degree of finish, as metal plates, would the more readily suggest itself, as the same change had just been made from wooden blocks to metal types for letterpress printing; but Vasari attributes engraving on metal to a different class of artists, the workers in niello, or inlaid modelling work, a very ancient art used for ornamenting every kind of table utensils, household furniture, hilts of swords, silver vessels for sacred and other uses. This art consisted in cutting the required subject or picture in silver, and filling up the incisions with a mixture of silver and lead, which, from its dark colour, was called nigellum, abbreviated into niello, producing a regular effect of chiaroscuro in the work. From these engravings the artists were in the habit of taking impressions by smoking them, and then, after cleaning the smooth surface with oil, impressing upon the work a damp paper. This was often done with sulphur or fine earth, but the proofs on paper soon became the favourite process, and ultimately led to the invention and use of metal plates, as copper, &c.; and this, again, was followed by the introduction of the copperplate printing-press, for which, as well as the typographical printing-press, we are indebted to the Germans. Thus it seems tolerably clear that the art of engraving with the burin, or, as it is now called, line engraving, owes its origin to the workshops of the gold and silversmiths, for many proofs on paper taken from the works in niello are existing in the Italian collections of art, especially in the Durazzo collection and the ancient Gadi gallery at Florence, and, as Lanzi says, "may be particularly

known from the position of the letters, which, being written on the models in the ordinary way, appear in the impressions from right to left, and in like manner the other parts of the impression are seen in reverse; for example, a principal figure, as a saint, stands to the left, when by his dignity he should have stood to the right, and all the actors write, play, &c., with the left hand instead of the right." Among the earliest books to be found ornamented with prints taken from metal plates, and which may be esteemed as the most celebrated, are the "Monte di Deo" and the "Commedia" of Dante, both printed at Florence; also the two editions of Ptolemy's "Geography," printed at Rome and Bologna, to which may be added the "Geography" of Berlinghieri, printed at Florence, all ornamented with prints by artists whose names are not known. This state of the art was soon altered, and the copperplate engravers, entirely separating themselves from the goldsmiths and other chasers of metals, opened regular studios, placed their names to their works, took pupils, and became altogether a new body.

Greek Art in Rome.

The works of art which were brought to Rome to adorn the triumph of Marcellus were the first productions of Greek art which were publicly exhibited among the Romans, and were the first incentives to the taste for decorating their public buildings with pictures and statues which led to the subsequent universal spoliation of Greece and Asia of their treasures of art. At first, says Plutarch, Marcellus was accused of having corrupted the public morals, since, from the introduction of these works, the Romans wasted much of their time in discoursing about architects and artists. Marcellus however boasted, even before Greeks, that he was the first to teach his countrymen to esteem the exquisite productions of Greek art.

Raphael's Light and Shade.

In the greater part of the cartoons it does not appear that chiaroscuro had more than an ordinary share of attention. In the *Miraculous Draught* plain daylight prevails. In the *Miracle at the Temple Gate*, a more forcible and more sublime effect would have been obtained from a cupola-light and pillars darkened on the foreground. In the *Execution of Elymas*, composition and expression owe little of their roundness and evidence to chiaroscuro. Apposition seems to have arranged the *Sacrifice at Lystra*. If Dionysius and Damaris, in the cartoon of the *Areopagus*, had more forcibly refracted, by dark colours or shade, the light against the speaker, effect and subject would have gained. Considered individually or in masses, the chiaroscuro in the cartoon of *Ananias* appears to be perfect; but the *Donation of the Keys* owes what impression it makes on us in a great measure to the skilful distribution of its light and shade.

The Geology of Surrey.

It may be stated, not as a hypothesis, but as a legitimate deduction from the facts before us, that the portion of the earth's surface which now forms the county of Surrey has experienced the following mutations:—First, it was the delta of a vast river that flowed through a country which enjoyed a tropical climate, and was inhabited by various reptiles, and clothed with palms and arborescent ferns. During this epoch the Wealden strata were deposited. Secondly, this delta subsided to a great depth, and was covered by an ocean, and formed the bottom of the sea for a period of sufficient duration to admit of the deposition of several thousand feet of strata, enclosing myriads of extinct species of marine fishes, shells and corals. This era comprises the formation of the chalk. Thirdly, the bed of this ocean was broken up, and some parts were elevated above the waves and formed groups of islands; while the depressions or basins were filled with the waters of a sea teeming with marine fishes and shells, wholly distinct from those of the preceding ocean, and fed by streams which brought down from the land the remains of terrestrial mammalia, and of trees and plants also of extinct species and genera. These sedimentary deposits constitute the tertiary formations. Fourthly, a further elevation of some parts of the solid strata and the depression of other portions took place, and the dry land was peopled by elephants, rhinoceroses, gigantic elks and other mammalia, whose remains became embedded in the mud and gravel of the lakes and estuaries—the post-tertiary deposits. Lastly, man appeared and took possession of the country; and such of the pachydermata as remained were either extirpated (as the Irish elk, &c.), or reduced to a domestic state. At the present time the metropolis of England is situated on the deposits which contain the remains of the elephant and the elk, and the accumulated spoils of the tertiary seas; the huntsman courses and the shepherd tends his flocks on the elevated and rounded masses of the bottom of the ancient ocean of the chalk; the farmer reaps his harvest in the Weald, upon the soil of the cultivated delta of the country of the iguanodon; and the geologist gathers together from the strata the relics of beings which have lived and died, and whose very forms are obliterated from the face of the earth, and endeavours

from these natural memorials to trace the succession of the physical events which have preceded all human history and tradition.

The Cheapside Cross.

The Cheapside Cross (one of those erected by Edward I. to Eleanor his queen) stood in the middle of the street, facing Wood Street end. Eleanor died at Hardby, near Lincoln, in the year 1290, and the king caused a cross to be set up in every place where her body rested on its way to Westminster Abbey. Cheapside was the intermediate resting-place between Waltham and Charing Cross, and "Magister Michael de Centuariâ, cementarius," was the mason employed in the erection of the cross. Its after-history is interesting. John Hatherly, mayor, "re-edified the same in more beautiful manner" in 1441. It was new gilt over in 1522 against the coming of the Emperor Charles V., and again in 1533 against the coronation of Henry and Anne Boleyn; new burnished against the coronation of Edward VI.; new gilt in 1554 against the coming in of King Philip; "broken and defaced," June 21, 1581; "fastened and repaired" in 1595 and 1600; again defaced in 1609; and finally demolished Tuesday, May 2, 1643, in the mayoralty of Isaac Pennington, the regicide; "and while the thing was a doing," says Howell, "there was a noyse of trumpets blew all the while."

Assyrian and Egyptian Art.

The perishable materials with which the Assyrians were forced to build their monuments and palaces have caused them long since to crumble into dust, and the remains of art are consequently few, but enough is left us to prove that they were a great and powerful people, and that their knowledge of the human figure, the taste and splendour of their dress, the richness and variety of their ornamentation, the beauty of their armour and the perfection of their arms of warfare, all show their superiority to the Egyptian. If it is difficult to decide between these two nations as to which was the originator of art, the lowest form of art in the representation of the human figure is perceived in the Egyptian work. In the productions of this nation huge standing or sitting figures, motionless as death, can be seen. Their artistic efforts are all adopted from the cube, square, angular and straight. If inspected, Assyrian art also exhibits the same angular principle of the cube. But the Egyptians had made the great discovery of the column, or cylindrical form, and introduced it in their architecture pure and simple. This is one of the chief principles of form in art as well as nature, and one great step in the direction of the knowledge of the beautiful. In the Assyrian architecture it was wholly wanting, to judge from the remains that have been preserved or that have hitherto been discovered. The Assyrians made up, however, for this deficiency by the elegant character of their architecture and by their advanced power of delineating the forms of men and animals. Their knowledge of the character of the different beasts of chase, particularly the lion, is astonishing, and their reproduction of the form, action and expression of these animals is not to be surpassed in truth and boldness.

Skew Bridges.

The credit for first arranging arch stones on spiral beds would appear to belong to William Chapman. He was a native of Whitby, but he practised mainly in Ireland and on canal works. He died in 1832 at Newcastle-on-Tyne. It occurred to Chapman that in cases where bridges did not cross roads or rivers at right angles each course of voussoirs should be rectangular to the face of the arch, the beds spiral, the soffits curved and twisted in their sommering, and that the head of each voussoir in the acute angle of the bridge would make an obtuse angle with its soffit decreasing towards the outer edge, whence it becomes acute, and increasing as it approaches the other abutment. The beds of the voussoirs are also twisted in skew arches, and under equal widths of bed the space between the intrados and extrados are increased upon the face as the haunches are approached (in the proportion as the secant of their angle of deviation from a rectangle with a line drawn between each extremity of their soffit). Only the joint at the centre of the arch is rectangular from the face, the others diverging towards the obtuse abutment, and increasing as the haunches are approached, and converging towards the obtuse abutment. The development of the face line of arch convex where acute with abutment and concave with the obtuse abutment. This curve Chapman called "polygonic," and the convexity will depend upon the versed sine of the arch, and that the form of arch to be preferred is the flat segment, that the head of each voussoir on the acute angle makes an obtuse angle with its soffit, decreasing as the crown is approached, thenceforward becoming acute, and increasing as they approach the obtuse abutment. Finlay Bridge, near the town of Naas, over a branch from the Grand Canal, was the first erected by Chapman in the year 1787 on the above principles. It is 25 feet span, with a rise of 5½ feet and the obliquity is 51 deg. or its supplement 39 deg. Chapman admitted that the same idea may have occurred to others, although he never heard of it.

THE CHATEAU OF PIERREFONDS.

THE château of Pierrefonds being close to Compiègne, the late Emperor of the FRENCH could hardly fail to take an interest in the building. As a consequence, an immense sum of money was expended in restoring the ruins, or rather in a re-creation of the buildings as they were supposed to appear before LOUIS XIII. destroyed them in 1616. The work was entrusted to M. VIOLLET-LE-DUC, and probably it formed his most important commission as an architect, for the outlay was at least 200,000*l.* About three-fourths of the money was contributed by the Emperor. The remainder came from the Historic Monuments Commission. The château, like most of its class, served a double purpose. It was a residence as well as a fortified stronghold. But as there were no representations of the buildings in their perfect state, M. VIOLLET-LE-DUC had to exercise his logic in order to infer what appearance they presented up to the seventeenth century. Practically he had only a part of the external walls to guide him. Opinions differ about the value of the restoration. Some approve of the architect's arrangements, but enthusiastic Gothicists maintain that VIOLLET-LE-DUC was incompetent to realise the beautiful work of the old designers. His modern buildings, where he had free scope, have been subjected to very severe criticism, and it is held that at Pierrefonds he was not more successful than at Coucy or Paris.

HOUSE AT WILPSHIRE, NEAR BLACKBURN.

THIS residence, of which we illustrate the principal fronts, is now being erected at Wilpshire, a fashionable suburb of Blackburn, from the designs and under the superintendence of Messrs. STONES & GRADWELL, architects, of 10 Richmond Terrace, Blackburn. The whole of the building is faced with straight-cut parpoints from Lightcliffe Quarries, Yorkshire. The stone dressings are from Morley Quarries, Yorkshire. The roofs will be covered with PEAKE'S "Perfecta" brown red tiles. The site is elevated, and commands fine views from Yorkshire to the Irish Sea, and full advantage has been taken of this favourable prospect. The general contractors are Messrs. MARSHALL & DENT, of Blackburn, the contractors for the masonry and brickwork being Messrs. E. LEWIS & SONS, of Blackburn.

HOUSE AT WITTON, BLACKBURN.

OUR illustration shows the west and south fronts of residence now being built in this favoured part of Blackburn. The principal rooms command extensive views over the valley of the Ribble. The lawns, terraces and kitchen gardens are all most suitably placed, having due regard to aspect and the contour of the land. The stone dressings are from Morley Quarry, Yorkshire, and the bricks are from the Accrington Brick and Tile Company's Works. The steps, landings, base-course, &c., are of stone from Shorrock Delf, Blackburn, and "Silex" brand stone from Yorkshire. The general contractors are Messrs. J. HIGHTON & SON, of Bridge Street, Witton, Blackburn, Mr. W. H. SIMM being the contractor for the masonry and brickwork. Mr. JAMES S. HARWOOD is acting as clerk of works, and the buildings are being carried out from the designs and under the superintendence of Messrs. STONES & GRADWELL, Richmond Terrace, Blackburn.

PROPOSED CLOCK-TOWER, WALTON-ON-THE-NAZE.

THE town of Walton-on-the-Naze might be made one of the most attractive watering-places in England, but rival interests have prevailed, and it is kept back. The clock-tower, which has been designed by Mr. J. S. MOYE, of Walton-on-the-Naze, will, when erected, be effective in breaking the monotony of the sea-front. Afterwards it may be expected that the neighbouring houses will be transformed.

Mr. Barclay V. Head has been appointed by the Trustees of the British Museum as keeper of the Department of Coins and Medals, in succession to Mr. Reginald Stuart Toole, who retires after forty years' service.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE sixth ordinary meeting of the Institute of Architects was held on Monday evening, Mr. Macvicar Anderson, president, in the chair.

Mr. GEORGE AITCHISON, on the part of the subscribers, presented the portrait of Mr. Alfred Waterhouse, R.A., past president, painted by Mr. W. Q. Orchardson, R.A., and remarked that they now possessed portraits of all the Past Presidents, with one exception, that of Mr. Edward P'Anson.

The PRESIDENT, having unveiled the portrait, then read the following address to students:—

Some Responsibilities of the Architect.

Life is full of responsibility. If this be true of human life in general it is emphatically so of the department which most concerns us—architectural life. Before entering on an undertaking the wise man counts the cost, and so it behoves you, who are about to enter on the career of the architect, to realise at the outset the responsibilities that will beset your path. Forewarned is forearmed. It is from no desire to deter you that I now crave your attention, for I hold that, provided you possess the necessary natural qualifications, the pursuit of architecture is one of the most delightful, as well as useful, avocations in which you can engage; but I have thought to you, whose experience is as yet for the most part theoretical, it might not be unprofitable to learn something of the responsibilities you will be called on to discharge from one who has had many years practical acquaintance with them.

Training and Study.

The primary responsibility, however, which meets you is one which you are yourselves competent to judge of without much assistance or guidance from others. The preliminary to all life-work is training. What is essential in other professions is equally so in architecture. There are those who tell you that artistic instinct is the essential qualification, and that if you have that, technical training is comparatively of little consequence. Without for one moment discounting the paramount importance of artistic endowment, to which I may refer later on, let me warn you against being misled by a doctrine so delusive. True, there have been, and no doubt will be, exceptionally gifted individuals who seem to grasp knowledge by intuition and to leap in a single bound over the laborious methods that have to be pursued by ordinary beings. But to rear on the basis of such rare exceptions arguments applicable to members of a large profession, is as absurd as it is misleading, and at the threshold of your career you may be absolutely certain that there is no royal road to the acquisition of knowledge, and that the only stable foundation on which to build the superstructure of a successful life's work is laborious and enthusiastic study. Hence it devolves on you, as students of architecture, to prepare yourselves for fitly discharging the responsibilities of life by availing yourselves now of such educational advantages as lie within your reach. Until recent years such advantages were hard to find, and it was mainly, if not solely, by picking up casually such knowledge as could be acquired during apprenticeship in the office of a practising architect that the student could educate himself. Now the case is different, and it is, I apprehend, in some measure attributable to the freedom of intercourse with foreign nations inaugurated during this century that such progress as we see has been attained. In France and Germany, as you are no doubt aware, the architectural student has to pass through a regular course of theoretical teaching in the school or the university. The same system is being adopted in America. The curriculum of the Architectural Association, as well as those of University College and King's College, indicate a distinct tendency to adopt, at all events in a modified degree, a similar procedure here, departures which thoroughly deserve all the support and encouragement we can extend to them. I do not desire that the practical training which can only be acquired by contact with actual work in an architect's office should be forestalled, but it is greatly to be desired that such training should be accompanied by theoretical and technical teaching such as is to be found in the courses to which I have referred. In the world's labour one day in seven is reserved for rest. In the routine of apprenticeship* it would be well were one day in seven also set apart for study outside of and apart from office work, and that the office hours were for pupils so arranged as to render it practicable for them to take full advantage of evening classes in the studio and the lecture-room without unduly taxing or injuriously affecting brain-power. That a generous spirit now pervades the profession, exhibited in the

* In the forms of articles published by the Institute it is stipulated "that with the object of enabling the pupil to qualify himself for passing the examinations for studentship and associateship," the Principal "shall and will allow the pupil such absence as he, the Principal, shall deem reasonable for the purpose of attending lectures, classes of instruction and the said examinations."

desire to promote the education of students, is unquestionable. The establishment of teaching centres, not only in the metropolis but in the provinces, demonstrates this.

I have already indicated that the development of this spirit may be to some extent traced to international intercourse, but I cannot doubt that it is more directly attributable to the action taken in recent years by the Royal Institute of British Architects, as the chartered representative of the profession, in inaugurating and establishing a system of examinations, for it is a fact, whether expressly stated or not, that the curriculum of each teaching body is so framed as to meet the requirements of such examinations. Now if the examinations of the Institute had done nothing else, it must surely be admitted by all, be they advocates or opponents of the system, that to have in a few years produced such a result is a distinct gain to the profession, the possibilities of which in the future it is difficult to forecast or to limit. As by the enlightened policy of provincial societies educational facilities are provided, preparatory to local examinations in connection with the Royal Institute, the whole country will be gradually embraced in an educational network, the meshes of which will be occupied by the embryo architects of the future, who will thus enjoy educational advantages which were not at the disposal of we older men in our early days. Hence it seems to me that the Royal Institute, in awakening in recent years to the responsibility of providing education by creating an examining body, and thus stimulating the organisation of teaching bodies, has conferred lasting benefits on the profession.

Having so far discharged our duty, we may fairly call on junior members and on students to fulfil the responsibility thus devolved on you by embracing the educational privileges which are now brought within your reach. Do not imagine that you will thus weaken the artistic instinct with which you may be endowed. The result of diligent study preparatory to examination is not in any sense to cramp or retard artistic development, but to equip you with knowledge which it is difficult otherwise to obtain, and without which no one would now be worthy of the name of architect. Let me, then, press on you the primary responsibility of qualifying yourselves for your life-work by entering on the educational courses and preparing for the educational test, which have been established with a view to your welfare. Quite recently I received a request from one who a few years since was a pupil of my own, and who is now practising in South Africa, that in order to promote his professional status I would propose him as an Associate of the Institute, accompanied by the incidental intimation that he was—I suppose by way of further fortifying his position—about to be married. I had to inform him that the only way to become an Associate was to prepare himself by study for the examination, and I suggested that he might usefully turn to advantage the interesting position he occupied by spending his honeymoon in a visit to the old country for the purpose of passing the examination. I have been tempted to mention the incident because of the sequel, for he has responded by asking me to send him a list of the books he should study and the particulars of the examination. The spirit thus evinced in a resident of a far-distant colony is creditable, and I venture to commend it to your favourable consideration, at whose door the educational privileges lie, which he can only embrace subject to serious difficulty and sacrifice.

Commencing Practice.

Let us now pass from the responsibilities of the student to those of the architect, and assume that you have, after years of study and preparation, attained the goal of having your first commission confided to your care. I have still a vivid recollection of the emotions which this event creates; the sense of pleasure derived from the reflection that at last one is freed from restraint; the enthusiasm with which one anticipates the fulfilment of long-cherished hopes; the delight with which the youthful mind revels in the feeling that now has come the opportunity of teaching the world something worth learning. All such emotions are natural and incidental to the freshness of youth, and the first sense of emancipation from thralldom, and, although subsequently sobered by experience, constitute a bright era of hope and expectation that in after life one recalls with pleasure and would not obliterate. I shrink, therefore, from uttering anything that might detract from the hopeful anticipation with which you rightly regard this event. Only one word would I venture to interpolate. It is natural that in the first blush of actual experience the feelings I have depicted should predominate, and that you should indulge with unstinted satisfaction the prospect of crystallising your long-cherished fancies. But remember that this is not all. The indulgence of your fancy must be duly leavened by consideration for the fancy and wishes of him who has given you the opportunity you so welcome. I know by experience that in early years the tendency is—I admit not unnaturally—to consign this consideration to a subordinate place, or not to regard it at all. Do not forget, amid the exuberant joy of youthful freedom or the justifiable pride of a first success, that your

responsibility is to your client, and that you are bound, while indulging your idiosyncrasies, to do so in giving artistic and practical effect to his requirements and in promoting his interests. Should you ever entertain doubt in respect to the soundness of your advice, a good test will be to ask yourselves whether, were you occupying the position of your client, you would yourselves act in conformity with the advice you are giving him.

Architectural Design.

You will now have entered on the part of an architect's experience in which unquestionably is to be found the most absorbing interest and the keenest pleasure—the creation of design. This is the most elevating sphere in which you can work, because it opens the field for the exercise of your inventive faculties. Call it instinct—call it genius—call it what you may—here is education exhibited that makes the architect, and without which he is not an architect at all, the spirit of the artist. Cherish this native inspiration. You cannot create it by human agency. You cannot destroy it. But you can misapply it, or you can by discipline and control make it the medium of conferring lasting benefit on your day and generation. Responsibility attaches to every faculty, every talent we possess, and for the cultivation and use of this inspiration—the indispensable, as it is the noblest, qualification of the architect—you are responsible to Him who endowed you with it. Let this ennobling consideration inspire your work. When I refer to artistic design, I desire not to be misunderstood. To apply it to the design of the elevation only is unjustifiably to restrict its sphere, for the plan offers the primary, and perhaps the most important, field for the display of artistic skill. I must not dwell on this, having on a previous occasion specially treated the subject of the art of planning, but I venture to express the hope that I then succeeded in demonstrating the conviction I strongly entertain, that no part of an architect's work, from an artistic point of view, is more important than the study of the plan. I have referred to the responsibility of regarding your client's wishes and studying his requirements. Let me here say that to do so is not only a duty, but it is often the means of imparting to work its highest interest. To embody in design one's own fancies is comparatively easy; to combine one's personal proclivities with the requirements of a client is frequently most difficult. Difficulty creates interest, and to succeed in spite of it is always enjoyable, and imparts to any work a zest which it would not otherwise possess.

Working Drawings.

The general design approved, you will have to proceed with the preparation of working and detail drawings, in which you will find the continued opportunity for the exercise of creative power. Every part of a building drawn to a large scale, and every detail drawn full size, form subjects of constant and engrossing study, a true idea of which can only be acquired by experience. Apart, however, from the interest of design embodied in such drawings, it must never be forgotten that they are in their character and object totally different from preliminary sketches. The latter are prepared for the purpose of illustrating the design, and when once it has been embodied in the working drawings they may be said to have served their purpose. Working drawings, on the other hand, are records on the basis of which the interests of others depend. From them the quantities are measured. Upon them the contract is framed. Hence it is obvious that you will be responsible for making such drawings clear, precise, definite, practical. Anything like sketchy indecision admitting the possibility of a twofold interpretation—any contradiction between one part and another, or one drawing and another—anything in the nature of slovenly draughtsmanship—these and such-like careless defects are unpardonable. Working drawings are not worthy of the name unless they are drawn with decision and accuracy, consistent with one another, finished in ink, coloured and reproduced in duplicate. You may naturally think that this goes without saying, but experience proves the reverse. It is because I have not infrequently seen working and detail drawings, prepared by so-called architects, which I have regarded as discreditable and unworthy, that I venture to urge upon you what I consider will be your responsibility in this respect. It is simple injustice to those whose interests are affected by them that working drawings should be other than unmistakably clear and definite. This does not necessarily imply that they must be devoid of artistic feeling. I have seen many, admirable in respect of their succinctness and charming in respect of artistic draughtsmanship. Let me say that where practicable it is most desirable that detail drawings should be prepared prior to the quantities being completed, in order that there may be no room for misconception as to the amount of work intended and the labour on it. I am well aware—only too well—that the rush with which much modern work has to be prepared—greatly to be deprecated—often renders this impossible; but whenever it can be done it should be done, for the advantages to all concerned are obvious.

The Specification.

Following on the completion of the working drawings, your next responsibility will be the preparation of the specification, the proper execution of which is of the greatest importance. Allow me to press upon you, from experience, the enormous advantage of writing your own specifications. No one can so clearly describe what he wants as the architect himself, and there is no valid apology for a young man failing to discharge this essential part of his duty. I always did so, until the pressure of work rendered it impossible to continue the practice. The work, I admit, is dry and uninteresting as compared with design and drawing, but it has an interest of its own, as all work has when honestly engaged in. Besides, it is no excuse or apology for the neglect of a part of our work, that it may not be so engrossing as other parts. That which is most unpalatable is frequently most beneficial, and a well-disciplined mind will take the bitter with the sweet, and strive to do all alike well. To write your own specifications is to be familiar with every detail in a sense in which you cannot otherwise be. On your visits of inspection during the progress of the work, you will find yourself master of the situation with every detail at your finger ends, in place of being dependent on others or constantly requiring to be refreshed by reference to a document with which you are only partially familiar. A specification, to be of use, must be full and clear, describing in terse language every branch of work, and leaving no room for doubt in the interpretation of its clauses. It should also have ample marginal notes for facility of reference. Much time will thus be saved. To write a specification is not artistic, but it is instructive work, and involves much consideration in respect to the nature of materials and alternative methods of construction. No one can properly write a specification who does not possess some practical knowledge of the building trades and the materials employed in each. Hence, to leave the preparation of the specification in other hands when you can do it yourself is deliberately to abandon the means of keeping yourselves in touch with much of the scientific progress of the day in its relation to architecture. Never, therefore, be induced to relinquish the personal discharge of this responsibility, so long as it is by any means possible to accomplish it.

The "Quantities."

With the completion of the drawings and specification other personages come upon the scene, in relation to whom your responsibilities will be extended. The appointment of the quantity surveyor will generally rest with you, and you will find it of the utmost importance to secure the services of one who, having acquired a thorough practical training, is conversant with the details of each trade, and who is quick and accurate. These qualities, combined with experience, will alone inspire the necessary confidence. The customary practice of including the charges of the quantity surveyor in the builder's contract and account does not commend itself to my judgment. For many obvious reasons, it would be better that they should be charged direct to the client and paid direct by him, subject to the approval of the architect. Need I add that the charges of the quantity surveyor, whether made direct or embraced in the contract, should, in every instance and without exception, be entirely independent of the charges of the architect? For the architect to participate, in any form whatever, in charges made by another, instead of being made direct to his client, would be alike unjustifiable and dishonourable. The practice with some architects is to take out their own quantities—a practice which very generally prevails in the provinces, though comparatively rare, I believe, in London. That such a custom is remunerative goes without saying, and it is justified on the ground that the necessary dissection of the building in the bills of quantities makes the architect more familiar with every detail than he would otherwise be. For my own part, while there is, of course, nothing dishonouring in the practice to those who care to engage in it, I consider that it is not in the least degree necessary on the ground stated, and that, in the case of one aiming at a purely architectural practice, it is not desirable. If an architect is not sufficiently conversant with every detail after having designed the building and prepared the working drawings and specification, he must be obtuse indeed. You will find quite enough to engross your time and thoughts in what—to my mind at least—is the more legitimate domain of architecture.

The Contractor.

To the contractor who engages to carry out your designs in accordance with your working drawings and specification, you will stand in a relation of undoubted responsibility. You will be the medium by whom arrangements between your client on the one hand and the contractor on the other hand will be made. You will thus occupy the position of an agent, and cannot be relieved of its responsibilities. You will have to see that the contract is fairly and honourably carried out by both parties to it—protecting your client on the one hand from any attempt at evasion by the use of faulty materials or defective workmanship, and protecting the contractor on the other

hand from any tendency to deprive him of legitimate remuneration for work properly executed. This dual responsibility you will only be competent to discharge by possessing such practical knowledge of materials and workmanship as will enable you to judge what is good and what is defective, and by uniformly maintaining an attitude of independence and integrity. I have met with clients who have not hesitated to condemn contractors as a class whose habits are predatory and who live on robbery, forgetting that there have been those in their own position to whom such strictures, if fair in the one case, would be equally so in the other. That such sweeping condemnation is unjust I need scarcely say, and your responsibility will sometimes consist in protecting the honourable client and the honest contractor from its injurious effects. My experience of life has been that one class is morally no worse or no better than another. Human nature is much the same, regardless of external circumstances. Morality is an individual not a class distinction. It has been my fortune and I trust it may be yours to meet with but few clients and few contractors whom I could regard with feelings other than those of respect and confidence. The large majority have been men whose gentlemanly courtesy on the one hand, and whose admirable work on the other hand, have reflected credit on themselves and inspired confidence in others.

Conduct of Works.

In superintending the execution of your designs you will find ceaseless pleasure, for there is a singular fascination in watching the gradual development of your ideas and their translation into a material and durable form. You will, if you care for your work, experience regret—as I have often done—that you are unable to live on the work, as the monks of old did, personally judging of each feature and detail in the position it is to occupy. Seeing that this is impossible in modern practice, it will be necessary for you to have a resident representative or clerk of works. In the selection of this official the greatest care and circumspection should be exercised. Practical experience, moral integrity and tact are indispensable qualifications. Once find a man on whose honour you can rely, and whose efficiency has been demonstrated, part not with him if you can help it; he is invaluable, and worthy of being regarded as a friend indeed. But your responsibility will in no way be diminished by reason of your having such a local representative, for without periodical visits of inspection it would be impossible that you could attest that the work had been properly executed, or that you could append your signature to documents certifying that the contractor is entitled to payment. To sign a certificate should never be regarded as a matter of form; it is, on the contrary, a serious responsibility which your client will rightly expect you to discharge with fidelity. In superintending work, knowledge of materials and workmanship is essential, but knowledge of men, and tact in exercising it, are also invaluable qualities. Firmness, combined with tact and courtesy, will educe willing and cheerful compliance with your instructions, where mere bullying—too frequently resorted to—will only lead to opposition and induce contempt.

Responsibilities of Neighbours.

Besides those I have mentioned, there are others to whom, in practice, you will occupy a position of responsibility. I cannot refer to all. Take one as an illustration. Most of you will in due course be called on to build in London, and you will in that event have to deal with the complicated Acts of Parliament controlling Metropolitan building, and specifying the relative obligations and privileges of building and adjoining owners, for one or other of whom you will have to act. To rightly interpret Acts of Parliament is not always easy, and if I may venture to say anything so heterodox, I fancy difficulty is occasionally experienced even by those whose official duty it is to enforce them; but there are, I think, certain general principles which should always inspire our responsibility. Building and adjoining owners, whoever and whatever they may be, have one common characteristic—they are neighbours. Many centuries since the question was asked, "Who is my neighbour?" It would be well were the spirit which inspired the reply more frequently found to pervade the negotiations between those neighbours with whose responsibilities architects are sometimes concerned. Too often is the building, or the adjoining owner, as the case may be, regarded as one whom it is well to pass by unheeded, one whose interests are opposed to our own, one who, if he has the chance, will take advantage of us, and one, therefore, of whom we are perfectly justified in taking advantage. I do not draw a picture that experience does not justify. Who has not heard of work having been pushed forward to completion with undue haste, or in the dull season, in the hope that, once done, it will remain, whether it inflicts injury to a neighbour or not? To designate such procedure as sharp practice is to use too mild a term; it is dishonest, dishonourable and worthy of all reprobation. Apart, however, from its immorality, it is stupid. Honesty not only commands the approval of conscience, but in such matters it is the best policy. You are much more likely to get what you want from a neigh-

bour by approaching him in a straightforward spirit, treating him with frank confidence and asking his permission to deal with joint property in the manner you wish than by unworthily trying, directly or indirectly, to take advantage of him. Do as you would be done by is the motto of the Christian and the gentleman, which I commend for your invariable adoption when discharging your responsibilities in connection with the interests of those who are neighbours.

Practice and Art.

Now it may have occurred to you that in regard to some of the responsibilities of the architect to which I have referred, it is difficult to trace any direct connection with art. The drafting of a specification, the arrangement of the conditions of a contract, the adjustment of differences between your client and the contractor, the treatment of the rights of your client in respect to his neighbour; or, again, the provision and arrangement of sanitary appliances, or the endless correspondence on mere matters of business which occupies so much time—these and other matters of a similar nature cannot by any stretch of imagination or any exercise of ingenuity be brought within the category of artistic work. Yet these are unquestionably responsibilities the discharge of which properly falls on the architect, and the neglect of which involves the necessary sequence that he fails in his duty to his client. Is it, then, true that the avocation of the architect is a purely artistic one, and that such matters as those which I have just specified should be relegated to the surveyor or the engineer? If so, then much of what I have said to you of your responsibilities is false teaching. But I appeal to common sense—I appeal to universal experience—nay, more, I appeal to the practice of architects who are undoubted artists, to demonstrate that the assumption is unfounded. I have, I hope, said enough to satisfy you that I consider your noblest and highest responsibilities will be found in the development of your artistic faculties in design. This is indisputable. To design in truth, purity and with artistic feeling, is unquestionably the most elevating attainment to which you can aspire, success in which will constitute the keenest pleasure you can hope to experience in your professional career. This is the most important part of the architect's work, but to assert that it is all is deliberately to close the eyes to patent facts in the vain effort to establish as truth a purely visionary theory.

Gentlemen, in this necessarily brief survey I have touched on some only of the responsibilities which you will be called on to discharge in the practice of your profession. Others will occur to you on which I might have dwelt had time permitted. One, however, remains, reference to which I dare not omit—your responsibility to yourselves. In this, after all, is to be found the key of the whole position. Be true to yourselves and you cannot but be true to others in every relation of life. Truth must and will prevail. Enthroned in the heart, it will find outward expression through the intellect in design and through the courtesies of life in practice. If true to yourselves in the earnest preparation for your career by diligent study and laborious research—if true to yourselves in the firm resolve to develop to the utmost those faculties with which you may be naturally endowed—if true to yourselves in the lofty ambition to consecrate your powers to the promotion of art and the benefit of the community, you will not only be true to all others, but you may cherish the well-grounded hope that you will attain success. And in all your struggles and efforts to discharge with fidelity the responsibilities of your calling, remember this, that you will not be less likely to inspire confidence and attain success as architects if you constantly bear about with you, in the complicated relationships of your professional life, the unmistakable characteristics of gentlemen.

Review of the Students' Works.

Mr. WILLIAM EMERSON, the hon. secretary, said:—It is my duty to make a few observations on the work submitted in competition for this year's prizes and studentships. I do not propose to make, nor would time allow of my making, a careful criticism of every work. I shall, therefore, confine myself to noticing a few of the principal sets of drawings and to making some general remarks, and I must say I feel acutely the position in which the President has placed me by asking for critical remarks, for the reason that criticism directly puts one in an adverse attitude, like one who is in search of defects and errors. I trust, however, I may be forgiven for any remarks I may make. In self-defence I must say that, in examining so many splendid sets of drawings, it was very much easier to be attracted by many beauties than hunt for defects and errors.

For the Institute Medal and twenty-five guineas only two gentlemen competed, and the essay, by Mr. C. Bernard Hutchinson, under the motto "*Persevera per severa*," was considered by the judges to be the better of the two, on the ground that it showed considerable research. But the primary object of this prize when instituted was, I take it, to be an encouragement of literary attainments amongst the rising

generation of architects. What would most of us know about architecture were it not for the works and writings of members of the architectural profession, both in ancient and modern times? Such names as Vitruvius and his many translators and commentators, Serlio and Palladio, Desgodetz and Blondel, Chambers, Pugin, Viollet-le-Duc and Street, one would think, might inspire more than two students a year to some effort in this direction. Research is not only what is required; the career of an architect (not to mention the chance of his publishing some architectural work) constantly involves him in reports and descriptive writings of all sorts, to be laid before all classes of people, for which style and good composition are essential. These two essays are weak from the literary point of view, and for this reason the Council have not awarded the medal, but each competitor has been allowed five guineas. Let us hope that next year will show some better result.

The Institute Silver Medal with ten guineas for measured drawings of an old building has this year produced only three competitors, and the award has been made to Mr. George S. Hill (motto, "*Saint Kentigern*"). His drawings, which are of the crypt of Glasgow Cathedral, show very considerable pains, are very well done, and the figured dimensions are carefully marked on them. I do not feel sure that the full-size mouldings are altogether accurate, but they may be, as there is some curious detail in this building, which is not of the best. Mr. Hill's Sketch-book notes are very full. The drawings of Lacock Abbey (motto, "*Red Thistle*") are also exceedingly careful and praiseworthy, and they are beautiful drawings. In the third set submitted nearly all figured dimensions have been omitted, and seeing that these are essential under the conditions laid down, it argues carelessness in their author; it is a pity to go so far and then fall short on a crucial point. It should be remembered that for measured drawings you can scarcely make too many notes or take too many dimensions.

The Soane Medallion and a sum of 100*l.* for foreign travel has this year brought out fifteen competitors—I believe as large a number as we have ever had. Perhaps the subject—a railway station—was a congenial one. The design which gains the medallion and 100*l.*, with the motto "*Inexorabile Tempus*," is by Mr. Arthur T. Bolton, an Associate. His plan is a very workable one. In all probability the iron roof over the station would stand, while in many of the other designs sent in it certainly would not. The arrangements seem good, but the architecture can hardly be considered of a very high character. It has a small resemblance to the Potsdamer Bahnhof at Berlin, but the composition of the main façade of that building is very much better. The lines of the gable and the angles it forms with the towers are awkward in Mr. Bolton's design. There are examples of this treatment in Italian work, but they nevertheless are rarely happy. It seems a pity, when the large arch is suggested, that its form should not have been followed in the opening it encloses, instead of the one shown, the shape of which is rather ugly. This design was nearly losing the Travelling Studentship, in consequence of the inferior drawing of the perspective and the poor entrance. It is worth while practising perspective drawing, for by it only can your design be effectively shown. The detail, too, is somewhat eccentric, though less commonplace than in the design placed second, which is by Mr. J. Scott Stewart (motto "*Loco*"); who obtains a medal of merit and ten guineas. In this design there appears to be insufficient abutment—or, rather, the abutment is not carried up high enough, for the large iron ribs to the roof over the station, which ribs, however, seem quite the best constructionally. Besides which, the plan is not quite so well arranged as in the one placed first. There is nothing objectionable in it, but, on the other hand, nothing to raise it much above the commonplace, though it is a very sensible and businesslike composition. The third accepted design, obtaining a medal of merit, by Mr. Alfred C. Houston (motto, "*Ad Rem*"), the Ashpitel prizeman of 1892, is in most respects the best as far as plan goes. It is perfectly symmetrical and well-balanced, and bears evidence of considerable study by a very practical mind. The arrangement of abutment to the iron roof is well considered, though it is doubtful if the sectional area of the iron columns, or the portion of masonry on which the weight of the huge principals falls, is sufficient. But there seems an unfortunate want of judgment as to the fitness of things when the external effect of the design is that of, say, a town hall, hotel or elaborate Board school, rather than a railway station. If the subject be a station, the principal feature of which is an enormous roof in one span, why mask it altogether or conceal it? There can be no doubt that in such designs the first thing to be considered is a workable plan properly answering the requirements, as economical as possible according to circumstances, and the second thing is that the design should be as artistic as possible, for therein are comprised suitability to the subject, good proportions, the right materials to be employed and beautiful detail. If the design does not look like what it is intended for, you may depend upon it that it is wrongly conceived. There should be no possibility of mistaking a church for, say,

schools, or of mistaking a prison for a workhouse, or a hospital for a hotel, or a railway station for anything else.

Notwithstanding many defects which must necessarily be found in students' designs, the above-named designs are worthy of very great praise for the thought bestowed on them and for their very careful delineation.

Following on these remarks I cannot but condemn in a friendly way a design which has for its motto a green device. Though there is some very pretty and attractive drawing in parts of this design, the plan is in the first place hampered by the introduction of two large towers, the supports of which cause difficulties about the booking-office and block up too much of the available space. Moreover, the arrangement is not sufficiently considered; as an instance, the board-room is on one side of the building while the secretary's office is on the other. A good deal of time and drawing has been expended on decorative details, to say nothing of the two towers before mentioned, which are absolutely unnecessary and unsuitable for a railway station, and in reference to this design I would remark that peculiar or eccentric detail (say, for instance, the arches over the entrance) does not necessarily mean original or new beauty of detail. The same remarks as to unfitness apply to all those designs which have lofty towers or campaniles as adjuncts. I lay stress on this because an ill-thought-out plan can never be made a good one by the addition of useless features or decorative details, however well they may be designed; on the contrary, their introduction usually tends to hamper the usefulness of the plan and leads to numerous difficulties. Just in passing from these sets of drawings I would mention that one competitor who introduces an enormous tower has clearly little idea of either fitness of design or proportion and strength of material. His tower is so marvellously out of scale as to be positively wonderful, and he introduces a tie-beam to his wooden roof some 4 feet deep and more. It seems to me that these valuable prizes induce a number of young men to waste a good deal of time in preparing designs for which the amount of architectural knowledge they possess is quite insufficient, which time would be more profitably expended in study. Would it not be possible to restrain this exuberance of youthful energy and conserve it in some way for more effectual later efforts?

For the Pugin Travelling Studentship some very beautiful drawings have been submitted, and those by the successful candidate, Mr. J. J. Joass, show a good selection of subjects and evince truly artistic feeling; in these careful drawings there is no strained effort to obtain a meretricious sketchy effect so much in vogue just now, as if a pretty drawing were the sole object to be aimed at by a student in delineating architecture. On the contrary they are well and carefully drawn, and one can make out clearly what their details mean. And the same may be said of the very excellent work of Mr. T. A. Sladdin, who obtains a medal of merit. The third, Mr. Harold Brakespear, who is honourably mentioned, has evidently great power of draughtsmanship and command of his pencil and shows one or two carefully drawn examples.

I may say that most of the sets submitted for this studentship are exceedingly good and interesting, and well worth looking at, evincing great industry in pursuit of the knowledge of architecture, but it is curious to see how the drawing of the plans and sections of ornamental detail is shirked; some hardly show a plan of anything. How can the detail of, say, an elaborate screen with niches and canopy work be properly understood if you only sketch the elevation and omit all delineation of projections? The three gentlemen who have obtained prizes in this studentship are exceptions to this, I was going to say, unfortunate rule, and their plans and details are exceedingly careful.

For the Godwin Bursary, Mr. Banister F. Fletcher is the successful candidate. He goes, I understand, to the World's Fair at Chicago, and will bring back a report on matters connected with architecture, for the benefit of the Institute. As there were only three candidates, I presume the practical subjects of sanitation, warming, ventilation, &c., do not commend themselves to the architectural student of to-day, though, nevertheless, they are important factors in an architect's practice.

The Owen Jones Studentship has brought forth one of the best series of studies of colour, by Mr. Alfred Hoare Powell, ever submitted to the Institute. These are all careful drawings to large scale, some being full size, and with a remarkable feeling for colour. Mr. Powell is to be congratulated on his artistic capacity. It is a pity that only two of his drawings show architectural colour by the juxtaposition and combination of coloured building materials. But his studies of colour decoration, especially those of the beautiful screen at Southwold Church, are worthy of the highest commendation, and I for one shall look with interest to the result of his studies abroad. His subjects are carefully selected.

Mr. A. N. Paterson, whose work is also exceedingly good, has submitted a selection of coloured studies and of pencil drawings of Italian architecture, in which coloured materials are used, but in the latter he has carefully omitted all colour,

which, seeing that this prize is mainly for that, is a little curious.

Mr. Francis Masey's drawings are very pretty, many of them are just what an artist might delight in doing, but they hardly show serious study of the methods of introducing and applying colour to architecture, and I do not quite see what trees and rocks have to do with the subject, unless they happen to be in mosaic or coloured sculpture.

For all these travelling studentships thought and care should be taken, first in the selection of the subjects and then in the method of their illustration; for a study one does not want so much a pretty sketch of the general effect with adjoining scenery as careful details of the arrangements, tints and methods of application of the colour. In frescoes or mosaics one would like to know, for instance, if the outlines of the figures, trees or buildings, &c., represented are in brown or black, and whether the shades or drapery are of a deeper tone than the general local colour or different, and if so what colour; and how the tesserae are arranged, either by horizontal or concentric lines or placed at random; and whether details of features or limbs or folds of drapery are shown by hard lines as in early glass, or by shade as in later periods. No small scale water-colour drawing can show such details as these, which are most necessary in arriving at a knowledge of how to produce certain effects to be seen either at a distance or close to the eye.

The Tite Prize, the subject being the "Interior of the East End of a large Town Church," is obtained by Mr. C. A. Nicholson (motto, "Omnia honeste et secundum ordinem fiant"), whose plan is well arranged. The whole design is in fair keeping throughout, but seems hardly serious enough for a church; such a subject would, in my opinion, be better for severer treatment, and the broken pediment over the altar might be replaced by something less frivolous and in better proportion. This is, however, a pure matter of taste, or shall I say a matter of pure taste on which some may think diversely? The organ is usefully and sensibly placed at the side in a gallery, and open to the transept as well as the choir, but the height to the roof above is hardly sufficient for free emission of sound; the orchestra is also well considered. The organ-case is full of original detail, very charmingly and nicely designed and showily drawn, though in the splashy and tricky style not to be commended. The work would have impressed one more had it been shown by sober, clear, fairly drawn and finished lines. It is evident Mr. Nicholson has thought rather more of the effect of his pretty drawings of detail than of the real architecture of the church. The general proportion is defective; the details of his main cornice, and the coffers in the soffits of his large arches, and the way some small arches spring from the imposts, might have been much better if a little more considered by one so exceedingly clever. Regard, I am glad to note, has been paid to the convenience of communicants by the introduction of side exits—a most necessary arrangement for a crowded town church; but a slight alteration would be requisite to the seating in the side chapel.

In respect to the design "Bramantino," by Mr. R. S. Dods, which obtains five guineas, one cannot but feel that thirteen steps up to the choir are decidedly too many, as the congregation half-way down the nave could hardly see the altar, and certainly not when kneeling; also there is no side exit for communicants, the omission of which always causes confusion. The detail of this design is less interesting, and has not the same life and originality as that of the one placed first. The lighting is also defective. Coming only from the small aisle windows and the lunettes above the cornice of the choir, it would be insufficient for a London church, and cause the altar and organ to be decidedly in the dark.

In respect to the position of the organ I cannot help feeling that there is a want of judgment as to the fitness of things in overshadowing an altar by the organ placed immediately behind and above it, as suggested in this design, and also as in the case of the plans marked "Modern Worship," where a huge screen supporting the organ and gallery for musicians is placed immediately in front of the altar, which is seen through it. Surely a church is an edifice constructed to enclose—or may I say a casket erected to contain?—the altar at which the worship of God is celebrated as the principal object, and also to shelter the worshippers, while the organ is simply a very important though secondary adjunct necessitated by the services held. Therefore to place the organ in a position which causes it to appear almost, if not quite, a more important feature than the altar—to say nothing of the distracting effect to worshippers of musicians immediately in front or over it—cannot be otherwise than wrong. There seems a want of really thoughtful feeling about such a suggestion, and whatever the framers of the report on musical arrangements in churches may say, I should think, if there is no other logical way than this out of the maze of instructions they have given, the report had better be modified. Indeed, I think the particular attention paid to the report on musical arrangements in churches has caused most of the competitors to think too little of the first and most important

consideration necessary to a town church, where large congregations and a number of communicants may be reasonably expected to attend, namely, that of making a convenient plan.

In the design marked "Crescendo" there is no side exit for communicants, and too narrow a space between the altar steps and the communion-rail, so that the clergy could not pass behind each other while communicating, but I notice that in this point his plan and section do not agree. "Modern Worship" would also be very inconvenient for communicants; indeed, most of the designs are weak in this point.

In "Incognito's" plan communicants must either kneel at the step at the end of the stalls, where only a length of 12 feet is provided, or nearer the altar on the next steps, which are three in number. Now one cannot kneel on three steps, or at any rate should not be asked to do so, nor even should there be two steps to the altar rail, for the officiating priest would be a step higher than the kneeling communicants, which would oblige him, especially if tall, to stoop considerably, a very tiring proceeding where many receive.

The design marked by a device of three circles is more a cathedral than a large church, but the organ and orchestra at the west end form decidedly a better arrangement than placing them either behind or in front of the altar; but it would require a small choir organ, which is omitted to be shown. By electric action both might be played from the same keyboard in the choir.

Hardly any one of these designs is very good in proportion. I said just now the first thing to be considered was a good plan, and the next a good elevation, and I now say the first and most important point to be considered in design is proportion—first, in respect to masses; and secondly, as to details. The best proportions to my mind are seen in the design with the motto "Modern Worship." "Crescendo" is more Gothic than Classic in relation of its height to the width. The dignified simplicity of the design by "Modern Worship" and the placing of certain decorative details are worthy of much praise. So is the composition of the screen and gallery for musicians, but his drawing is rather inferior to some of the others. The fine open space in front of the choir would make decidedly the best general plan shown, apart from the east end, which is, however, the subject named. Could a space large enough for the organ have been provided in one of the sides of the octagon facing down the church, I should say he would have made a very good suggestion indeed, or even if he had divided it (notwithstanding the report) and put half on either side of the choir in the alternate sides of the octagon, it would have been very good for antiphonal singing, and the sound would travel well into the church.

Indeed, this competition is most satisfactory as showing life and courage and industry in the rising generation of architects. This, in fact, applies equally to all the sets of drawings submitted; the thought and elaborate draughtsmanship evolved is amazing, and cannot be anything but beneficial to the art. But I think it would be well to consider the drawings and studies of some of the greatest masters of past days; some were shown in these rooms not long ago, and I have a recollection of seeing sketches for both pictures and architectural designs in the gallery over the Arno, between the Uffizi and Pitti Palaces at Florence. In these I could not help noticing how those masters of composition, whether for pictures or architecture, roughly, but fairly, drew out the masses of their designs, first weighing well the proportion and lights and shades, scarcely any detail being shown at all, or perhaps a sketch by itself of cap, column, entablature or pediment, showing clearly that in their eyes the details were matter of after consideration. A few lines and shadows carefully drawn showed the general study of the design, which was afterwards clothed with detail. Nowadays the excellence and facility of draughtsmanship attained appears to have the effect of causing more attention to be paid to detail than to the main architectural features, which are apparently drawn straight off without any such careful studies as those I have named; it also sometimes appears as if the general design were made for the sake of introducing certain details that would fit it; in fact, the very opposite method of working to that employed by the old masters, the first and grander idea of proportion being allowed to take care of itself. Of what use or value is a building if its plan does not answer the primary purpose? and again, of what use is detail, however beautiful it may be, if it does not embellish fine proportion? The old buildings we most admire are those in which proportion is perfect, or nearly so, whether it be the architecture of Greece, Rome, the Middle Ages, or the Renaissance; the detail is an extra though interesting incident, but grandeur or fine architecture in its truest sense can never be obtained by that alone.

Judging by some of the sketches and drawings I have examined, the draughtsmen apparently forget that the object of a student's drawing architecture and architectural detail is first to learn, and then to show the work clearly and the form of its details accurately, not to indicate in a showy way the general effect—this is all very well for a newspaper artist, but

for the architectural student it leads him into a wrong appreciation of the objects of architectural drawing. And here I cannot help remarking that I think a large amount of harm has been done of late years to architecture and architects generally by the amount of tricky and misleading pen-and-ink draughtsmanship which has become the fashion; the effects are in most cases absolutely untrue and unlike the buildings when erected, and this fact photography often reveals. For instance, red brick buildings with white stone dressings or other varieties of coloured materials are constantly made by means of illicit shadows and impossible broad lights, splashes, dots, broken lines and other dodges, to appear to the effect produced in the drawings, and most disappointing, often because no particular thought has been given to proportion and the disposition of the materials or masses of colour, or masses of shade, and depths of mouldings or reveals. In fact, the object in the class of work I refer to is not so much to represent faithfully an architectural design, but to make a showy drawing to impress the uninitiated, and in this the superficial and meretricious feeling of the age seems to be represented. The fairly thoughtful, well-coloured drawing of an earlier period was certainly less deceptive.

But so long as it is forgotten that drawing is only a medium by which architecture is studied or shown, and students and others vie with each other in simply turning out pretty drawings, so long will many of our modern buildings result in disappointment. The effect of detail as well as of general masses is what has to be learned, and this can only be done by careful dissection of old work, by measurements and accurately delineated drawings.

My friend, the late Mr. William Burges, said he was ashamed to think how many books he had filled with pretty sketches during his earlier travels, and at that point he would have stopped had not a critical friend asked him cynical questions as to why he did this drawing or that pretty sketch, and why he had not drawn the full-size curves or contour of that particular moulding, till at last he was obliged to confess that the sketches had been done for the vanity of making pretty pictures, and that they were absolutely useless. He then made up his mind to turn over a new leaf, and the result was that he obtained an entirely different collection of drawings from his former ornamental sketches, in the shape of rough but accurate and valuable documents. I would commend this fact to the thoughtful student for reflection.

Perfect drawing and facile draughtsmanship are most necessary to an architect, but do not let us exaggerate their importance and make an architectural god of drawing, which is, after all, merely the A.B.C. by which we express our intentions. I speak strongly on this point because one cannot help seeing the danger some of our young men are falling into of considering the drawing more than the truthful effect of the structure they portray. Do not misunderstand me. I do not wish to decry clever draughtsmanship, but only the fascinating tricks now in vogue. Every architect should be able to draw well, though it is well known that many men have turned out beautiful buildings who were no great draughtsmen, but whom, nevertheless, we shall find it very difficult to beat, notwithstanding that many young architects have already left them far behind in respect of drawing.

If a man cannot draw he cannot even suggest his designs properly or rightly correct his details, and this is a necessity; but it is a different thing from priding himself on doing every detail with his own hand. My old friend, Burges, used to say your head work is more important than your hand work, and do not waste too much of your time (that is, as a practising architect, not as a student) in the merely mechanical work which others, under your instruction and correction, can do just as well for you. In this I have not the slightest doubt he was right, from the highest architectural point of view; and if a late celebrated architect, to whom we owe one of our latest public buildings, had made fewer drawings with his own hand and given more time and thought to the arrangements of the architecture generally, the result would have been less disappointing, more useful and more artistic; nor need the detail itself have suffered in the least degree, with proper supervision, but quite the contrary.

Perfect drawing of good designs needs no adventitious aids or tricky artifices. The beautiful drawings of Mr. Heber Rimmer and Mr. Bedford, with the less perfect drawings of Mr. Kitsell, shown as the result of their travels, are a clear proof of this. Let your work tell the straightforward, honest, manly truth, for you may be certain that in the long run a truthful delineation of architecture and architectural subjects will help a student on the road to success much more safely and surely than pretty untruthful suggestions of effect which designs when executed fail to realise.

A vote of thanks to the President and Mr. Emerson, as proposed by Mr. John Slater, was passed by acclamation.

The President then distributed the prizes, the list of which was published last week, and the meeting terminated.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of the Edinburgh Architectural Association, Mr. W. W. Robertson, president, in the chair, Professor Baldwin Brown read a paper on "Bronze Doors and their Artistic Treatment." He began with some general remarks upon the subject of design, as illustrated by the principal bronze doors of which art history took account, and in this connection laid special stress upon the importance of considering the characteristics of different materials and processes as a preliminary to design. He described and illustrated, by means of lantern transparencies, a number of famous bronze doors. A Classical bronze door he explained to be a copy in bronze of a panelled door in wood. Mediæval bronze doors, he showed, fell into three groups—firstly, those found in Saxony; secondly, those found in Southern Italy; and thirdly, those met with in Tuscany. The first two groups belonged to the eleventh and twelfth centuries, whilst the third group belonged to the centuries from the thirteenth till the sixteenth. Views of characteristic examples of all three groups were afterwards thrown upon the screen, and their salient features pointed out. Professor Baldwin Brown was thanked for his paper.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the meeting of the Glasgow Architectural Association Mr. H. C. Shelley read a paper on "Some Scottish Castles." Mr. Campbell Douglas, the president, occupied the chair. Mr. Shelley dealt with about twenty of the castellated structures, situated chiefly in the western district of Scotland, which illustrated the various styles of structure which had prevailed since the twelfth century. He said that the study of ancient castles was very interesting. The present so persistently claimed attention that people were in constant danger of forgetting that past in which it had its roots, and the loss in so doing was by no means insignificant. Those students of antiquity who did not allow their interest in the past to blind them to the claims of the present were continually emphasising the continuity of all life and protesting against the habit into which some scholars had fallen of dealing only with phases of life. It was a protest which could not be too often repeated. There were many ways by which they might preserve their historical continuity, but hardly any method was likely to yield such splendid results as purposeful visits to those ancient castles, which remained sole witnesses of an age which had passed away.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE general meeting of this Society was held at the School of Art on January 10, when Mr. J. B. Mitchell-Withers, jun., A.R.I.B.A., read a clever technical paper on "Architectural Illustration by Means of Photography." Mr. Innocent presided, and there was a large number of the members present. The lecturer gave an exhaustive description of the various processes through which photography had been, especially during the past five years, brought to perfection for illustrative purposes, and his paper was made further interesting by a number of fine photographs and photo-prints hung round the room, which were closely examined by the members. A discussion took place, in which the President, Messrs. F. Fowler, C. Hadfield, E. M. Gibbs and H. L. Paterson took part, and a hearty vote of thanks was awarded to the lecturer for his instructive paper.

THE FUTURE OF EGYPTOLOGY.

ON Saturday last Mr. W. M. Flinders Petrie, the first holder of the professorship at University College, founded by the munificence of the late Miss Amelia Edwards, delivered his introductory lecture. He said that in Germany, France and Italy facilities had long been provided for students of Egyptology by their Governments, while the English Government, although it had occupied the country for ten years, had done nothing, and even private enterprise had been hindered rather than helped by English diplomacy. The only public teaching in the subject had been in the languages of Egypt and Assyria, started many years ago, but no other department had been touched. No encouragement had been given to the study of Egyptian history. It should be remembered that every fragment of the products of the past was concrete history. Everything was a document to the archæologist. Yet the only collections made had either been rigorously preserved from close handling or were inaccessible in private hands, and there had been no centre of information and union for students at work. At last provision had been made, but at the price of a great loss, Miss Edwards, whose devotion to the subject, untiring

energy and noble nature were known to all students of Egyptology, had for the first time made a permanent provision. Another heavy loss had been sustained in the death of Mr. Chester, who had laboured for years to spread the knowledge of Egyptian antiquities. Mr. Petrie said, as professor, his aim would be to provide for the wants both of those who needed a complete library for exhaustive study and for those who could only spare occasional hours at home. During a portion of the year the books in the library would be lent out under adequate safeguards. There would also be a collection of over 1,000 photographs to show the gradations of Egyptian art and style, and also an abundant supply of those paper impressions or "squeezes" of sculpture which were so invaluable for study. There would, too, be a collection of original objects for the close examination of students. Miss Edwards had formed a collection with much care—as complete and typical as possible. He hoped, also, to place on loan his own collection, and to have a series of annual loan exhibitions drawn from the many valuable private collections in England. There would thus be found a collection of deities, the most complete collection of scarabs, the only chronological collection of beads, a dated series of pottery, the largest collection of funeral cones, and also of Egyptian weights. In certain lines of study their museum would not be merely supplemental, but would be in advance of any historical museums. The Professor then sketched out the work which he proposed for himself and the students who should attend his lectures. He would give a series of lectures in the autumn and spring, and would prepare students who might wish to undertake practical work in Egypt, where he would spend the time from Christmas to Easter. If students provided ability and time it ought to be for others to find the money. From his own experience he could safely say that from 300*l.* to 400*l.* would provide the costs of travelling, living, excavating and transport of collections for one excavator for a season. As he had before said, it was the whole history and geography of Egypt, as well as the language, which were comprehended under the term Egyptology. Brugsch Pasha's priceless volume, "*Ægyptologie*," revealed how wide a field was covered. For the political history, besides Brugsch, there were Wiedemann and Meyer, as well as compilations such as the "*Egypt of the Past*," in which Miss Edwards had a large share and Rawlinson's later work. But these needed large revision. In religious history there were the publications of the *Musée Quinet*. In law Revillout had published most, but on the documents of later times. But, for the general outlines of the whole subject, all had borrowed from Wilkinson, but none had surpassed him. The art of Egypt needed much more systematic study than it had yet received. The extant materials must be the main guide for distinguishing the successive schools, periods and localities. Careful detailed work was also needed on the architecture, whose prehistoric forms might be seen fossilised in the hieroglyphs drawn from the various forms then used. The geography, the principles of name-giving, the titles of office, all required further elucidation, whilst the history of hieroglyphs was a subject "still to let." Careful research might disclose much more than we now know about the presence of foreign races in Egypt. And its connection with other nations made the chronology of Egypt of world-wide importance. Greatly as estimates had varied, we now knew that the variation is confined within tolerably definite limits. From continuous astronomical statements we were warranted in believing that as far back as the sixteenth century B.C. we were on solid ground. In the practical department there was much need of trained hands for excavation and exploration. There was no greater mistake than to suppose that a scholar must be an excavator, as totally different qualities were required by the two. The *corpus* of materials at our disposal still required a systematic reduction to historical order. Of pottery there was almost a complete series throughout the whole of Egyptian history. No comparative series, however, of funereal figures or *ushabtis* had been published. The scarabs with personal names of kings and officials had been partially published, and the exact dating of the history of beads would be of great value. On glass and glazes Mr. Henry Wallis had done much, but a great deal remained to discover. The subject of metallurgy and chemistry had only been touched by, at most, twenty analyses, and Dr. Gladstone had given some very interesting results of recent work. Research was still required into the use of tools and weapons, and a complete *corpus* of drawings or photographs of all dated coffins was much needed. Amulets, toilet objects, jewellery, weights and measures were all subjects on which further investigation might fruitfully be expended. His ultimate hope was to see drawn together a solid body of workers, each contributing some permanent advance to knowledge. It had been the glory of England that the free worker had frequently rivalled the specialist. Murchison, Spottiswoode, Huggins, De La Rue, Evans, Lubbock, Sir William Grove were household names, and yet all this work was done outside of the course of life which most men would consider full enough without a scientific reputation. Might we not see arise a Murchison or an Evans of Egyptology?

THE DRAINAGE OF RICHMOND, SURREY.

ON Saturday the action commenced by the late Mr. Charles Dickinson against the Richmond Main Sewerage Board was decided before Mr. Justice Wills, who had the aid of Sir Douglas Fox, C.E., as assessor. It was to cover cost of work and labour done and material provided and money expended in the construction of the Richmond Main Drainage Works, also for damages for breach of contract. The hearing of the case took place in June last, when judgment was reserved. The late plaintiff on August 4, 1888, contracted with the defendants to construct certain sewers in the parishes of Richmond, Kew and Mortlake, for the sum of 40,666*l.*, according to specifications annexed to the agreement. It was provided that the sewers were to be constructed according to the orders and directions of the defendants' engineer, and completed in eighteen months. On August 28, 1888, the defendants' engineer gave the plaintiff notice to commence the works, which he accordingly did. On September 28 the defendants' engineer ordered the line of sewers on the drawing to be altered, the altered line going through private property belonging to Mr. Poupart. The plaintiff's case was that, although he repeatedly asked the defendants and their engineer to procure for him liberty to enter upon Mr. Poupart's land, he was stopped by Mr. Poupart and prevented from proceeding with the altered works. It was further alleged that it was agreed that between Gipsy Corner and manhole 97 the plaintiff should proceed by open trench work instead of tunnel work, that additional land was necessary for such work on either side of the proposed line of sewer, that the defendants neglected to procure him possession of such land, and he was prevented from completing the said line of sewers. On November 14, 1889, the defendants informed the plaintiff that they had given their engineer instructions to make arrangements for the construction of the works by another contractor. By the contract deed the defendants had power to determine the contracts in the event of the plaintiff failing to exercise due diligence in carrying out the works. Plaintiff alleged that, owing to the action of the defendants, he was prevented from completing the contracts, and that therefore he was entitled to damages amounting to a very large sum.

The defendants, in defence, denied that they had acted unreasonably. They submitted that the plaintiff wrongfully abandoned the works, which they had been compelled to complete, and counterclaimed for damages.

Mr. Justice Wills, in his judgment, said that with regard to any part of the new sewer alluded to in the first contract which the plaintiff did not execute he was entirely in the wrong. He was quite satisfied that if plaintiff abandoned the works he did so on no ground for which the defendants were responsible, and that if the defendants took them away from the plaintiff they were justified in so doing. With regard to the second contract, the plaintiff had no intention of performing it, and raised every kind of difficulty for the purpose of getting out of it. In his opinion the defendants' engineer was disposed to be very fair, and even liberal, to the contractor. With regard to the sewer under Mr. Poupart's land, the engineer was within his rights in ordering it to be tunnelled, and Mr. Poupart's consent was not necessary, because the plaintiff could have proceeded by giving a notice under the Public Health Act. He was of opinion that the plaintiff had no intention of performing that part of the contract. He pronounced judgment in favour of the defendants, but would reserve all further questions until the rest of the case—the question of damages—had been disposed of. Sir D. Fox had read his (the learned judge's) judgment, and concurred in the views expressed therein.

Mr. Houghton, for the defendants, remarked that, as Mr. Dickinson had died since the action was brought, the defendants might come to the conclusion that an end ought to be put to the litigation.

SCHOOL BUILDINGS.

Wilton.—About a dozen competitors sent in architectural plans and designs for the proposed new Church schools, in response to an advertisement in the *Northwich Chronicle* and other papers. These designs were submitted to Mr. Douglas, architect, of Chester, as assessor, who found that all of them would exceed in cost the amount named, 2,500*l.* He, however, selected three designs, under the signatures of "Pro Ecclesia," "Cheshire" and "Economy," which he recommended as approaching the nearest to the desired conditions. We understand that the committee have selected as their choice the design of "Pro Ecclesia" (Mr. M. K. Ellerton, architect, of High Street, Northwich). This design Mr. Douglas described as being "most carefully thought out." Mr. Ellerton may be congratulated upon his success. His design is most in accord with the architecture of the church, and is certainly as effective as it possibly could be within the limits assigned. Mr. Ellerton,

it will be remembered, was the architect of the Brunner Free Library, Northwich, the Gladstone Club, Northwich, and Marston Schools. The various designs, including those accepted, "Pro Ecclesia," "X.," "X. Y. Z.," "Adaptability," "Effort," "Economy," "Light and Air," "Ecclesiasticus," "Education," "Cheshire," &c., have been placed in the Salt Museum for public inspection. Probably some modifications will have to be made in the accepted design to meet the difficulty of expense, but taking it as a whole, and judging by the design exhibited, we believe the new school will be a handsome addition to the architectural attractions of Northwich. The site selected is in Church Walk, close to the gates of the parish church. Mr. Ellerton, the architect, in his particulars states:—"Having made a careful survey of the site, I can only appreciate the wisdom of erecting a building that will harmonise as far as possible with your fine old parish church. This, in regard to the external appearance, I have placed foremost in my conception of the design, while avoiding any sacrifice in the utility of the arrangement of the plan, and I have given my careful consideration to the construction of the work. I have kept the separate parts of this building within the limit of height required according to their disposition, so as to come more nearly within the sum stated to be at disposal for its erection. I have not carried up the front of my building higher than the classrooms, nor extended the area of the central hall above their level, this, in my opinion, being unnecessary, as an upper floor is not required, while it admits of better light and ventilation at the ends of the central hall." Further on Mr. Ellerton very candidly states that, if carried out in full, his design would cost more than 3,000*l.*, but that with modifications of the design it may approach the cost of 2,500*l.* The building contract is not yet allotted.

GENERAL.

Professor Aitchison, A.R.A., will commence his course of lectures at the Royal Academy on Monday next.

M. Vauthier, the French sculptor, died in Paris on Tuesday, in his sixty-first year.

The Arts Committee of the Liverpool Corporation have decided to hold a spring exhibition of pictures in the Walker Art Gallery.

The Agent-General for South Australia has purchased *Circe Invidiosa*, by Mr. Waterhouse, A.R.A., and *A light of laughing flowers along the grass is spread*, by Mr. Ridley Corbet, for the Adelaide Art Gallery.

The Painting by Albert Dürer of the enthroned Virgin and Child, which was purchased at a costly price, has been hung in the Berlin Gallery. It was produced during his residence in Italy, and for once he ceased to employ a hard style. It is inscribed "Albert Dürer german. faciebat post virginis partum, 1506."

Sixty Designs have been submitted for the new Government buildings which are to be erected in Victoria, Canada, out of which five will be selected as the basis of a second competition.

Mr. H. E. Stannus will on Tuesday, the 24th, read a paper at the Society of Arts, in the Applied Art Section, on "The Theory of 'Storiation' in Art."

Professor Mackay, Liverpool University College, read a paper on "The Teaching of Architecture in the new University" at the meeting of the Liverpool Architectural Society on Monday.

Mr. J. P. Jones has taken into partnership Mr. Sydenham W. Richards (late of Richards & Gethin, architects). The offices of the new firm of Messrs. J. P. Jones, Richards & Budgeon are in St. Mary Street, Cardiff.

A Communion-table of dark polished oak is being executed for Rubislaw parish church, from the designs of Mr. A. Mackenzie (Mathews & Mackenzie), of Aberdeen.

The "Lincoln Chronicle" says:—"The scheme for filling the vacant niches in the canopies of the choir stalls at the Minster with oaken statuettes, representing the saints of the Anglican Calendar, is fast approaching completion. Of the sixty-four statuettes needed fifty-eight have been already given, leaving only six to make up the entire number."

Mr. John Taylor, A.R.I.B.A., architect, of Longton, Staffs, has taken into partnership his late manager, Mr. Harry Burgess, and the firm will in future be styled Taylor & Burgess.

The Surveyors' Institution meets on Monday, the 23rd, when a discussion will take place on the papers—by Mr. P. D. Tuckett, entitled "A Short Explanation of the Proposed Bimetallism as affecting British Interests," and by Mr. A. Goddard, entitled "The Currency Question and Land"—read at the last meeting.

A Block at the Military Hospital, Devonport, was destroyed by fire on Tuesday, and will require reconstruction.

On Wednesday, the 25th inst., Mr. Wyke Bayliss, F.S.A., read a paper at the meeting of the Society of Arts, entitled, "The Fine Arts in relation to the Sanitary Condition of our Great Cities."

The Architect.

THE WEEK.

THE London County Council received one hundred and fifty-six applications for the appointment of manager of works and stores. Six of the candidates were selected by the committee, and then the number was reduced to three, viz. Mr. J. HOLLOWAY, Mr. G. T. EARLE and Mr. A. ROBERTSON. The appointment of Mr. HOLLOWAY was recommended. It was approved by the Council. The salary is to be 700*l.* a year, and the conditions are as follows:—"That he do hold his office during the pleasure of the Council; that he be required to give his whole time to the duties of his office, and be not allowed to take any private business; that any fees received by him either as a witness or in any other capacity be paid to the Council; and, further, that on retirement he shall not make any claim to any retiring allowance under the Superannuation Act, 1866; and that he will submit to any general scheme which the Council may adopt with respect to insurance for pensions or superannuation."

THE proceedings in the police offices and the infliction of fines have compelled the London School Board to become more anxious about the sanitary conditions of the schools. On Monday last the Works Committee decided that the following general instructions drawn up by the assistant architect should be sent to the clerks of works, to guide them in making their reports, so that all may work upon the same lines:—1. The main school drain to be disconnected from the sewer by a properly constructed man-hole having a channel floor, an interceptor on the sewer side, an air-tight iron cover and frame, and a fresh-air inlet shaft. 2. An up-cast ventilating shaft should be at the head of the main drains. 3. All soil-pipes should be ventilated and should be placed on the outside of the building. 4. All lavatory wastes should have traps and discharge over open gullies outside the building. In addition to this the wastes on the upper floors should discharge into open hopper heads on the outside of the building, or they should, if close to windows, be carried up and ventilated. 5. All rain-water down pipes should be disconnected from the drains and fitted with shoes and open gullies. The drains from the rain-water pipes inside a building should be made to discharge into a gully in the open air. The foot of stackpipes inside a building should be made accessible by means of a small iron cover and frame. 6. The drains, traps and connections should be tested with smoke, and bad joints and defects which show themselves must be made good. 7. State whether the offices are fitted with iron troughs and whether they are flushed by automatic tanks or by a hand lever; state the condition of the troughs, and whether the seats are movable so as to enable the trough to be properly cleansed by the schoolkeeper. A considerable number of the schools are now up to these requirements, and when the remainder are placed in a similar condition the clerks of works are once a year to examine and test the whole sanitary system at each school, and send in reports upon the subject.

IT is not uncommon in Mediaeval sculpture to find figures of two angels holding thuribles and incensing the Blessed Virgin and Child, who are standing or seated between them. But the subject is rare among seals. Archbishop EYRE, who is a thorough student, said at a meeting of the Glasgow Archæological Society that, after considering the descriptions of 2,608 seals, he found only five in which there was a representation of the Divine Infant in His Mother's arms, with angels waving thuribles. They were the burgh seal of Dundee, a Dunkeld bishop's seal, and two Kelso seals. The Archbishop exhibited a photograph of the seal and counter-seal of Rutherglen, which have a relation to the Kelso seals, for the emblems are—first, the Divine Child in the arms of the Blessed Virgin, who was seated; second, two angels waving the thurible or censer; and third, a ship or a galley with sails furled. The explanation of the three emblems on the Rutherglen seal would seem to be:—1. The Blessed Virgin was represented

because the ancient church of the burgh was dedicated to her. 2. In her arms was the infant Saviour, whom the two angels were worshipping by offering and burning incense in thuribles. 3. The ship or galley was also represented, because from an early date Rutherglen was the chief trading town and shipping port in the lower part of the Clyde. The seal had only the galley with the legend, "*Sigillum communitatis de Ruglenensi.*" The counter-seal had the Virgin and Child with the angels, but without the galley. Its legend was a leonine verse, and runs thus:—"Signant ista tria rata navis nauta Maria," *i.e.*, "These three approved things form the seals, the ship, the sailor and MARY." From this legend it could be gathered that the seal and counter-seal were looked on as one seal, because the galley was not on the counter-seal. Also it seemed clear that somewhat later than A.D. 1493 the seal was no longer used as a pendant seal, but that the seal and counter-seal were re-made in the form now before them by adding all the emblems in one seal, by omitting the legend "*Signant ista tria,*" &c., and changing the other legend into "*Sigillum Burghi de Rutherglen.*" The Archbishop's description of the seal has interest for others besides specialists, for it is a warning to many who employ Mediaeval subjects as signs and ornaments. It appears that when the new burgh hall of Rutherglen was erected thirty years ago an adaptation of the seal was carved on the walls. It represented the Divine Infant in the arms of His Mother, not seated but standing, a small galley on the water, and on each side a figure, meant for a bishop, holding a thistle. No motive seemed to have been assigned in explanation of the action of the authorities of Rutherglen in carving upon their town hall this bastard shield, in which two figures with thistles were substituted for the angels with censers. For the old legend was substituted a Latin rendering of a local saying, "*Let Ru'glen's lums reek briskly.*" The authorities, like good easy men, have no doubt felt proud of their ancient symbol, which after all is only a practical joke by a native humourist.

ATTEMPTS to mulct peers and trustees in additional legacy duty are supposed to be signs of a watchful Government. They are rarely successful. In theory it may be right to assess every accidental advantage which may arise to new possessors of property. But, on the other hand, allowance should be made in cases where, from the value of property becoming diminished, legacy duty was paid in excess. Where is the Chancellor of the Exchequer who would be magnanimous enough to return duty under the latter circumstances? In London the Courts were occupied recently by a case where an increase of duty was sought on account of a rise in the value of paintings. In Edinburgh a case is now being tried which has greater interest for artists. The late PATRICK ALLAN-FRAZER, who died on September 17, 1890, bequeathed his whole estate to trustees to be devoted for the benefit of art. The interest was to be employed for the assistance and encouragement of young men not having sufficient means of their own, who should be desirous of following out one or more of the professions of painting, sculpture, carving in wood, architecture and engraving; and to provide for the comfortable maintenance and support of aged or infirm professional men, being painters, sculptors, and literary men, and those who from physical defects were incapable of supporting themselves in comfortable circumstances. Directions were given in the will for the maintenance and education of thirty art students at the testator's house at Hospitalfield. It was also stated that the aged or infirm persons to be benefited should consist of four painters, three sculptors, and three literary men. A sum of 50*l.* was appointed to be paid annually to each of them during their lifetime, or so long as the trustees should think proper. There were also special bequests to institutions in Arbroath. The value of the testator's estate in Forfarshire was declared to be 60,371*l.* 1*s.* 7*d.* The trustees paid succession duty on it at 10 per cent., which used to be the highest rate. The duty amounted to 6,037*l.* 2*s.* 2*d.* But by an Act of 1888 it was ordered that the duty on the property of persons who died after July 1, 1888, was in the case of a stranger in blood to be increased from 10 to 11½ per cent. Accordingly an additional sum of 1,000*l.* has been claimed by the Government. The defence of the trustees is that the additional duty does not arise in cases like theirs.

CHURCH BUILDING IN ENGLAND.

IT would be presumptuous to assert that England is the most religious country on the earth, but there is no doubt that more money is expended among us on account of religion than elsewhere. The Parliamentary return which has just been issued is evidence of the generosity with which one class of good works is supported, that is, the building of the churches. It supplies information respecting "the number of churches (including cathedrals) in every diocese in England which have been built or restored since the year 1873." The return is, therefore, supplemental to one which appeared in 1876, and which gave the expenditure from 1840 to 1873, under similar conditions on all churches except those in the dioceses of Peterborough and Gloucester and Bristol.

The selection of the year 1840 as a starting-point for the preparation of the returns was probably determined by the difficulty of obtaining exact information relating to an earlier time. But it is to be regretted that an effort was not made to show the progress since 1818. In that year not only was the Incorporated Church Building Society founded, but an Act was passed which removed many of the obstacles which prevented the erection of churches. It used to be a costly process to obtain the authorisation for getting up a church or chapel of ease; in a case at Derby the amount expended on preliminaries is said to have been 1,000*l.* After 1818 the effect of the new arrangements was seen in the encouragement of building. While in the period from 1811 to 1820 only ninety-six churches were erected in England, between 1821 and 1830 the number was increased to 308, and there were 600 built between 1831 and 1840.

The Parliamentary return of the period between 1840 and 1873 was incomplete, and the information was not given with any uniformity. In some cases there was hesitation about recording the expenditure. But it was ascertained that 24,291,719*l.* 13*s.* 7½*d.* had been laid out on church fabrics between 1840 and 1873, and it was likely that with a better system of account-keeping a much larger sum would represent the payments. Two dioceses, as we have said, were excluded, and the cost of the works at Westminster Abbey was given.

The last return is far more complete, and is arranged in a clearer manner. The subjoined summary reveals that in less than twenty years the expenditure on the building and restoration of churches in England has amounted to 20,531,402*l.* 18*s.* 9½*d.* It may, therefore, be assumed that in about half a century the Established Church has paid on account of building not less than forty-five millions in hard cash.

There are no signs that the demand for new churches has ceased, and it is not impossible that twenty years hence the next Parliamentary return about churches will appear as remarkable and as creditable as those which were obtained by the late Lord HAMPTON and the Duke of WESTMINSTER. If the cost of the churches erected by other bodies of Christians are considered, the result will justify what we have said about the position which England holds as a supporter of Christianity.

According to the last return, London has the credit of the largest expenditure, viz. 2,009,307*l.*; but in proportion to population and area Manchester, with its 1,579,445*l.*, can be said to have exhibited greater generosity. A large part of the 752,480*l.* which appears for Rochester, and some of the outlay in St. Albans, should, however, be credited to London.

The returns of the London diocese have some peculiarities. In several of the divisions the whole of the money obtained was used for restorations. East and West City, St. Margaret and St. John (Westminster), St. Marylebone, St. Martin-in-the-Fields and Uxbridge cannot point to new buildings as proofs of the generosity of the inhabitants. In other places the expenditure on new buildings is amazing. Hammersmith is not a wealthy district, but the rebuilding of St. Paul's has cost 25,026*l.*, St. Thomas's Church cost 4,656*l.*, Holy Innocents 7,000*l.*, St. Saviour's 3,878*l.*, St. Simon's 11,000*l.*, St. Mary's 7,000*l.* Nearly all the money was obtained from local contributions. Fulham is still poorer, yet new churches have cost 28,211*l.*, in addition to 11,900*l.* for restoration. Kensington has gained reputation for liberality in supporting church work. The

new churches have cost 146,137*l.* St. Mary Abbots is put down at 31,000*l.*, but so extensive a building must have cost a larger sum. St. Augustine's cost 20,000*l.*, St. Cuthbert's 17,000*l.*, St. John Baptist's 23,140*l.*, St. Helen's 10,000*l.* For restoration 21,503*l.* was paid. In Chelsea the rebuilding of Holy Trinity Church cost 35,000*l.* The Goldsmiths' Company paid 13,000*l.*, the cost of erecting St. Dunstan's, East Acton. Mr. NORMAN SHAW's church in Bedford Park cost 9,000*l.* The expense of restoration at Chiswick Church by Mr. PEARSON was 22,662*l.*, towards which the late H. SMITH contributed 19,912*l.* The family of Mr. F. OUVRY paid 3,000*l.* to rebuild the tower of St. Mary, Acton. Alderman SYDNEY erected St. Gabriel's, Bowes Park, costing 6,500*l.* Mr. P. TWELLS not only erected St. Mary Magdalene, Enfield, at a cost of 14,896*l.*, but gave 10,000*l.* for endowing it, and Mr. H. S. MILES paid 10,480*l.* for All Saints, Friern Barnet. At Teddington, St. Alban's cost 30,000*l.*, and St. Stephen's, Twickenham, 15,054*l.* In St. George's, Hanover Square, a large sum was expended on restoration, viz. St. Mark's, North Audley Street, 11,000*l.*; St. Michael's, Chester Square, 9,000*l.*; St. Peter's, Eaton Square, 15,800*l.*; St. Gabriel's, Warwick Square, 4,000*l.* The new buildings are St. Mary's, Bourdon Street, 12,233*l.*; St. Philip's, 10,000*l.*; St. Mary's, Graham Street, 4,000*l.*; St. John's, Wilton Road, 15,000*l.* In the Harrow deanery the most expensive church is St. Andrew's, Willesden, which cost 8,500*l.* St. Mary's, Hornsey, cost 17,183*l.* St. James's, Hampstead, 10,000*l.*; while the restoration of St. John's parish church, Hampstead, entailed an outlay of 12,822*l.* The cost of Holy Trinity, Stroud Green, was 12,500*l.*, and of St. John, Hornsey, 11,386*l.* That fine building, St. Augustine's, Kilburn, cost 35,377*l.*, towards which the congregation gave 34,527*l.*; and the 30,000*l.* required for St. Matthew's, Bayswater, came entirely from the congregation. In the East of London so many new churches could not be erected without much self-denial on the part of the people. St. Paul's, Glyn Road, Hackney (11,300*l.*), and Holy Trinity, Dalston (7,500*l.*), were no doubt built out of the proceeds of the sale of two City churches, and there were a few donors of large sums, but in general the money was derived from congregations. St. Mark's, Dalston, cost 16,025*l.*; St. Bartholomew's, 14,300*l.*; All Saints, Stoke Newington, 13,990*l.*, and St. Andrew's, 13,500*l.*

In the eighteen years from the beginning of 1874 to the end of 1891 the outlay on St. Paul's Cathedral for maintenance, decoration and restoration has amounted to 125,957*l.*, which was made up of 64,164*l.* from ecclesiastical funds and 61,793*l.* in voluntary contributions. The heaviest expenditure was 15,873*l.* in 1886, and the lowest was 3,653*l.* in 1877. Canterbury Cathedral called for an expenditure of 35,127*l.* At Winchester 9,586*l.* was laid out mainly in the restoration of screens. Restorations at Bangor amounted to 10,104*l.* On the west front of St. Andrew, Wells, 13,196*l.* was expended, besides 660*l.* for bells. The repair of the campanile and a new clock at Chichester cost 3,193*l.*, a lightning-conductor 638*l.*, a choir-screen 937*l.*, and the restoration of the cloisters 2,099*l.* The sum expended on the cathedral of Ely was 7,050*l.* Besides the annual normal expenditure on the fabric of Exeter Cathedral since 1873 exceptional works amounted to 39,223*l.* Since 1876 19,972*l.* has been laid out at Gloucester. Between 1866 and 1876 the citizens subscribed 40,000*l.* towards the restoration of the nave. Hereford Cathedral needed no more outlay than 1,692*l.* At Lichfield the restoration of the west front and north and south towers and spire amounted to 45,550*l.* At Lincoln the expenditure was 37,434*l.* Llandaff cost 3,424*l.* The remainder of the restoration fund, or 2,013*l.*, was all the disbursement that was necessary at Christ Church, Oxford. A large amount of work was executed at Peterborough, and the details fill a whole page of the return; but to the end of 1892 the outlay was not more than 44,609*l.* As the fees of the late Sir G. S. SCOTT and Mr. PEARSON amount to 1,730*l.* it is evident that commission was not charged on many of the items. The restoration of Rochester Cathedral was in hands between 1871 and 1877, and cost 23,000*l.* On the works of the west front the outlay has been 2,065*l.* The costliest restoration has been St. Albans, which already has amounted to 160,000*l.* Up to 1880 the subscriptions were 40,000*l.* Since then the work has been carried out at the sole expense

of Lord GRIMTHORPE. At St. David's the restoration was commenced in 1864, and continued to 1892, when the expenditure was 43,452*l*. Works (including stained-glass, which cost 6,563*l*.) were completed in Salisbury Cathedral, and cost 49,548*l*. At Southwell Minster the outlay was 20,826*l*. The cost of the new cathedral of Truro is entered as 113,684*l*., which was derived from voluntary subscriptions, church collections and legacies. Worcester Cathedral is another of the sound buildings; for one year only 6*l*. 1*s*. 4*d*. was laid out on the fabric, and the total cost of conserving it during seventeen years was 1,926*l*. The sums laid out yearly for the maintenance of York Minster between 1874 and 1891 come to 33,010*l*. In addition the south transept was restored within and without at a cost of 41,319*l*. For the restoration of St. Cuthbert's window 819*l*. was paid, and releading the nave roof cost 1,778*l*. The restoration of Durham Cathedral from 1873 to 1889 amounted to 38,414*l*. Carlisle was so recently restored the expenditure has been on the following extra works, viz. a throne, 525*l*.; a reredos, 1,790*l*.; a font, 739*l*. It is supposed that the restoration of Chester Cathedral since 1873 has cost 84,056*l*.; the late Dean considered the amount was over 100,000*l*. Liverpool is without a cathedral. Manchester expended 48,334*l*. on restoration. Upon Newcastle Cathedral 33,738*l*. was laid out. Since 1873 the total expenditure on Ripon Cathedral has not reached 500*l*. The cathedral of the new diocese of Wakefield has been restored at a cost of 28,882*l*.

We have added to the official summary an abstract of the expenditure in the preceding period:—

Diocese.	From 1873 to 1892.						From 1340 to 1872.
	Churches Built at Cost of			Churches Restored at Cost of			
	£	s.	d.	£	s.	d.	£

THE "QUARTERLY" ON ARCHITECTURE.

ABOUT twenty years ago a writer in the *Quarterly Review* demonstrated that the hope of English architecture was to be found in the working-man (carpenters, bricklayers, plumbers, slaters and smiths, were alike eligible), and that the most promising structure of the age was a club somewhere in Westminster, which was erected without any help from an architect. Persuasive as was the article, it was ineffective. People who were about to erect buildings did not go in search of the legitimate successors of the Greek and Roman builders that were to be discovered without difficulty in the lanes and alleys of London. Their indifference to the future of architecture was, however, excusable. The writer of the article by some oversight omitted to explain two considerations that have importance for every one who contemplates building. It may be he was too occupied with the thoughts of a new revival of art, or, like so many reformers, was oblivious of all things financial. Whatever was the cause, he did not make it clear that when the British workman had the disposal of clients' cash, buildings would be produced more economically than at present. Unfortunately the world is too sordid to risk money for the encouragement of experiments in that art which is the most incomprehensible to outsiders. The writer also neglected to show how by the use of primitive methods of organisation and appliances, and with architects who were to be occupied as workmen, buildings could be completed with increased expedition. Nowadays every contractor has penalties hanging over him if he exceeds a specified term before giving up a building to the owner and in a fit state for occupation. It was not clear how under the proposed conditions of carrying out works delays would be obviated. As the article was defective, inasmuch as the writer did not venture to grapple with the subjects that have most interest for people who have to pay for buildings, it is no wonder that not one conversion from old ways was accomplished by the writer. He would have been as successful if he had treated of dolls' houses and addressed himself to dolls.

Harder to bear has been the indifference of his pets. The English working-man was not inspired by the article to display any readiness to assume novel responsibilities. His ambition is of a very simple sort. He desires to make as much money as possible with the least mental exertion. What does he care about the ardour of Mediæval builders? He has heard that in those old days men like himself were not much better than serfs, and he must pity, if he does not despise, the weakness which could find consolation for daily misery in producing beautiful work at the command of a monkish taskmaster. An English worker is of a sceptical turn, and naturally doubts the motives of the benevolent schemers who are so eager to see him in an exalted position and controlling instead of being controlled. They may think only of the benefit to the arts; he shrewdly concludes that their proposals are only a dodge to get more work out of him. The carpenters, bricklayers and other operatives were therefore as deaf to the appeals of the writer in the *Quarterly Review* as lay and ecclesiastical clients. If an occasional workman is ambitious enough to attend drawing-classes in the evenings, he does not take the reviewer's conclusions to heart; all his efforts have one object, which is the possibility of setting up as an architect, and he will be only too glad to aid in perpetuating a system which repeatedly has been declared to be destructive of architecture.

After twenty years of neglect by all classes, the reviewer, for we presume he is the author of the article on "Architecture" in the last number, has had the gratification to find one incident which appears hopeful. If he exaggerates its importance, who can blame him? All his visions of the future of architecture have been renewed at the appearance of the volume of essays called "Architecture: a Profession or an Art?" The writers also seek a reform, but we doubt if they have been inspired by the reviewer, or would care to adopt his conclusions. Out of the thirteen essays there are only one or two in which the abandonment of buildings to workmen is advocated. The majority uphold the dignity of the architect, and it might be imagined that some of the writers would like to see the creation of a hierarchical caste

from which every man who meddled with business was excluded. But as they are in revolt against the existing system of practice their book is utilised as a means for the repetition of an attack with the weapons that have already failed.

It is strange, however, that the writer has not profited by experience. He addresses the public, but he will not employ the arguments which have most influence with them. Their interest in building is determined mainly by questions of cost and convenience. Yet the reviewer does not condescend to treat of one or the other, as if he were an inhabitant of Utopia. He scorns the conditions of the everyday life which is around us, and from which we cannot escape. Thus in one place he writes:—

Most people seem to think that building is a recondite, mysterious art, requiring much instruction, special talent and peculiar experience; whereas no work is simpler or more practicable by any man of sense. Of course it must be so. By nature men were meant to live in houses, and for this reason Providence has given to almost all men aptitude for building handicraft, and for the rational arrangement of a plan. Nothing but joyful carefulness is further needed. Here in London, on account of the pernicious and demoralising tenure of the land, to build is held to be in some respects degrading, and the well-to-do affect and cultivate peculiar ignorance even of the houses that they live in. On this affectation and this ignorance the Royal Institute of British Architects is founded. Architecture, the most popular of the arts, cannot exist or thrive on leaseholds; it is essentially of freehold origin and growth; it springs from absolute possession, and in London consequently it at present is impossible. It is a silent art, and grows unconsciously in practicable development, and not by means of talking Institutes and tumid lecturers. It is deliberate, for permanent enjoyment, and not hasty, for a speculating gain. Were the people fairly well instructed in the first necessity of family existence, so that they might build, or supervise the building of their houses, this absurdly Royal Institute would have no *locus standi*, and would quickly disappear.

We agree with the writer that the leasehold tenure is a drawback to good building, and it would be an advantage to have more deliberation about work and an avoidance of speculation. But obnoxious as are those evils, they surround the majority of building undertakings in this country. Are people to defer building until leaseholds are superseded by freeholds, or until they can become silent, deliberate and regardless of profits? If those virtues are requisite we may as well go back at once to the cave dwellings which nature has provided, for there is little likelihood of so superfine a life arriving within a century. Is it not plain, however, from his assumptions that the author admits his system of building is not adapted to the necessities of our time? If workmen are to be architects there must be clients with tempers that cannot be ruffled, and the men who labour must be either rogues or angels.

Although our author believes that almost every man has an instinct for some building handicraft and for evolving rational plans, he has to admit the rarity with which those natural gifts are utilised. In one passage he says:—

Since art is the enjoyment of the workman, what a scene of misery is London! The whole place is an emphatic art negation. As we have discerned, the showy buildings are a sham; but the immense majority of dwelling-houses have not even a pretence of art. This all means unhappiness; the constant loss of that enjoyment which has been designed by Providence for those who labour. At the present time, and largely owing to the folly of the middle-class, who train the children of the working-class in that contempt for work which is the worst and most degrading form of education, these young people are diverted from the workmanship which should be their delight, and are induced to think a handicraft beneath them. Household work is wholly strange, and is not even to be hinted to your educated Board-school girl; and boys regard their fathers' trade and artisanship with an insolent aversion. The ambition of the younger artisans is not to do their best in art, but to escape from handiwork entirely. Mere acquisition is their aim; that they may spend their money in the current travesties of art, and add themselves to the insatiate votaries of social folly. Thus four millions out of five who live in the metropolis are constantly demoralised in their life's work, and the remaining million in their obvious expenditure. The houses, furniture and dress of Londoners are a display of epidemic imbecility, and those who should be the most influential in a possible reform seem most incapable of general improvement.

When the tendency of life is towards depths of that kind, the reviewer, instead of decrying architects, ought to give praise to those among them who are endeavouring to keep themselves and their art in a state of uprightness. They are heavily handicapped, and yet they continue to keep a straight course. For the writer should remember that the peculiarities of architectural practice in England

were not entirely the creation of the practitioners. They arose out of the altered conditions of life. As clients have become more mistrustful of builders and workmen, the architect's functions as an overseer, auditor and agent have increased. His character as a man of business is with most clients of more importance than his artistic power. Only a minority of Englishmen are able to appreciate architectural art on right grounds, but every one can resent the weakness which produces a lawsuit with a contractor or a neighbour. If an architect's skill as an artist caused disappointment the Courts would not give redress, but neglect of his duties as an agent would be likely to be punished by the judges and juries.

On that account it seems to us to be vain to expect that ordinary people will ever yield to any application for such a transference of responsibility as is proposed in the *Quarterly Review*. Cases might arise in which American precedents would be followed, where a commission is divided between a designer and a superintendent of construction. But with opinion as it is, the workman has no chance of such a trust as now belongs to an architect. It is the peculiar character of workmen which helps to keep up the existing procedure, and makes it necessary that at least a clerk of works should remain during all operations, even when the building is not of importance.

To say that in the Middle Ages the workmen were the architects is merely an endeavour to deceive readers who are ignorant. The conditions under which works were then carried out were different from those which now prevail. For churches and ecclesiastical buildings there were monks to exercise superintendence. But if the workmen ever possessed the charge of works they were unable to retain the office. As early as the thirteenth century they came under the sway of professional architects.

But the writer in the *Quarterly Review* does not believe that the progress of architecture was determined by important buildings. He cares little for masterpieces, and fancies that builders and clients in all ages resembled him. It is in the village and among ordinary houses that he would seek inspiration. We have no desire to undervalue the domestic architecture of England, and if rightly considered it can be turned to good account by modern architects. It is not, however, to be credited to the unaided skill of the village workmen. The houses were generally raised by builders whose training was not obtained by apprenticeship to one trade. They were able to draw plans as well as to interpret them, and could derive hints from architectural works. But with all his merits, the country builder was unable to advance with the times, and architects are not to be blamed because he was left behind.

It is too absurd, too like the conduct of the wolf in the fable, to make architects responsible for what took place more than a century ago. According to DRYDEN, "The first physicians by debauch were made, Excess began and sloth sustains the trade." But the man would hardly be considered as sane who went about advising people to have recourse to the "simples" of old women in villages, or the lancet of a barber. Rustic art and medicine can be admired without incurring an obligation to be ruled by them.

From all that is said about the Institute of Architects, it might be imagined that the object of the review was to condemn that body. But the writer after all is not as severe in judging the evils which seem to be inherent in the Institute as are some of the most prominent members. There is probably not another society in Britain with so many discontented members. But the gregariousness of human nature keeps them from revolt. The Council, we are sure, must in their hearts agree with the reviewer when he says, "If wise parents wish to make a youth a real architect they should avoid the Institute entirely," and refers to "that great cavern of despair whose entrance is the Royal Institute of British Architects." There is hardly one of the thirty odd pages of the article which does not contain remarks which are as wounding. But if sarcasm could reform the Institute it would not now hold so anomalous a position among English societies. It is, however, hard that the misdeeds of the Institute should be debited to the general body of architects, and, if the reviewer were better acquainted with reality, he would have treated that part of his subject with more discrimination.

HISTORY OF LOCKS AND KEYS.

AT the meeting of the Society of Architects at St. James's Hall, Piccadilly, on the 24th inst., a paper was read by Mr. Harry W. Chubb, A.M.Inst.C.E., entitled "The Art and Mechanism of Locks and Keys, with some Remarks on Modern Strong-rooms."

Mr. Chubb said:—The study of locks and their keys, historically considered, does not, as in the case of successive styles of architecture, exhibit a direct and continuous connection between utility and form. Of grille-work and of other branches of the ironworker's art it may be said that use and ornament are often, and in fact generally, found together. The development of locks, however, is chiefly noticeable from the mechanic's standpoint, and as such is extremely interesting. When ornament is seen it is usually a pure addition *per se* to the mechanical parts; but a few cases do exist in which form and decoration can be distinctly traced back to a useful purpose. No information about locks is at present obtainable earlier than the time of the Pharaohs. Sculptured at Karnac is a lock which, to all intents and purposes, is similar to that used in Egypt now. That such a survival should exist might be doubted, but for the fact of other survivals of ancient methods and appliances in the East. Homer is not silent on the subject. He speaks ("Odyssey," xxi.) of Penelope using a brass key, very crooked and hafted with ivory, to open her wardrobe. Eustathius, a Greek commentator living at Constantinople about A.D. 1170, writing on Homer remarks that this kind of key was very ancient, but was still in use in his day, although keys with wards had been since invented. This form of key is sometimes dug up, and specimens may be seen in the Guildhall and other museums. It was probably used either to draw back the bar or bolt which slid in staples across the door, or else it was used only to withdraw a pin or catch that secured such bar in its locked position. One noticeable peculiarity of the Egyptian, and in fact of nearly all locks down to the middle of the last century, is that they needed no key to lock them. The bolt invariably carries with it the auxiliary mechanism—be it springs, pins or catches—with which it is secured in the locked position. No doubt this way of making a lock, that was in a sense automatic, was accidental rather than intentional.

The Roman locks were like the Egyptian ones, inasmuch as a partial sliding of the key was necessary. But more intricacy is attempted in them: the auxiliary pins holding the bolt are grouped closely, and are varied in section from the plain, round or square; the key, too, has to turn a quarter-circle before reaching the pins. Some ornamentation on the key-shafts or handles is noticeable.

In this era appears the padlock. Securing merchandise and treasure in transit, a knowledge of its mechanism became widely diffused, and the exact principle of these early padlocks is to be seen in those of India, China and Japan at the present day. Among Roman keys are many small ones attached to finger-rings, and these rings in a few specimens are also provided with seals. Locks and keys of the Byzantine era have not come under the author's notice, but there is little doubt that some attention must have been given them, for the age was a mechanical one.

Early English keys have their bows made in the shapes of ecclesiastical symbols. Some of these remain to us in bronze.

That most interesting period of metal-work, and, in fact, of many of the arts—the *Françoise*—contributes many beautiful examples of keybows. Chiselled carefully out of solid metal for the most part, they are perfect little embodiments of the spirit of the age, and must have been as highly prized then as they are now. Invariably Gothic in style, their delicate traceries are only equalled by the minute care displayed in the fanciful workings of their "bits." The locks which they served were provided internally with semicircular projections, around and through which the keys passed whilst being turned. These projections or "wards" were fastened in a separate case or box (hence called "box of wards"), and impeded all but the correct key whilst turning to reach and so withdraw the bolt. The decoration of the lock-cases consisted then, and later, of flat pierced plates, successively superimposed so as to form minute mouldings in Gothic tracery. Often the keyholes were hidden by some secret device.

Medieval German keys are hardly noticeable, but the lock-plates have a freedom of treatment and charm about them quite characteristic. The use of long springs at right angles to the inner end of the bolt led to a widening of the lock-plate at that end. To effect this the sides are spread out in graceful curves, or the end is made trefoil in shape. The surface decoration is light, generally consisting of two curved branches meeting below the keyhole. The branch ends divide up and carry conventional representations of flowers embossed and incised, whilst the meeting stems of the branches form distinct guides by which to find the keyhole on a dark night. Here, at any rate, are two points where usefulness has governed and produced ornament. The Renaissance did not at once give birth to new mechanism, but presentation and chamberlain's official

keys shared in the revival, or rather alteration, as to decoration. Departing from the beautiful four-sided structures of Francis's time, keybows become two-sided only, and show the cyphers of their owners, surmounted by crowns or coronets; tiny dolphins standing on their tails, and Venuses, in pairs, gazing with steel eyes at one another. About the commencement of the seventeenth century the letter padlock appears, altered and improved by a French engineer some 150 years later. Also in 1628 a most complete and special treatise on the locksmith's art was published by one Jousse, at Paris. Jousse, from the way he writes, evidently had to make his own tools and prepare his own metal. His key illustrations are in thorough keeping with the period. Regnier, the French engineer, who improved the letter padlock about the end of the last century was quite a mechanic. He has left us drawings of some ingenious keyless locks, to open which external knobs or dials had to be turned to certain marks. About this time, 1774, in England, Barren conceived the idea of improving upon what was known as the "tumbler." This was a spring-catch that "dogged" the lock-bolt, and had to be moved up out of the way by the key when turning, before the key engaged with the bolt itself. Barren cut slots in the flat part or "tail" of the bolt, and projecting stumps or pins on his "tumblers" closely fitted these slots. This idea subsequently developed into the lever lock. But a great advance was made by Bramah in 1784, despite the fact that the sliders upon which the security of the lock depends can be seen from the outside. In 1818 an ancestor of the writer's produced the Chubb's detector lock. From that time to this it has undergone various modifications and improvements: it has been assailed from many quarters, but it has held its own and still continues to do so, and that in an increasing degree. Modern arts give a wide range for the ornamental treatment of keys, and those made for presentation to the Queen and to other members of the Royal Family for recent functions have a decided character of their own. None of these keys are mere dummies; in every case they are constructed to operate the main entrance lock of exhibition or other public buildings.

It will, doubtless, be admitted that neither art nor craft can progress by simply copying previous work. It may under such conditions be said to exist, but the probability is that it will decline. To live healthily, and so to advance, minds and hands must work, either by arranging combinations of existing things, which shall be new combinations, or else by producing distinctly new things. In a measure the men who do either are inventors, whether designers or mechanicians. If these axioms be granted it is safe to say that the locksmith's craft, with power to requisition every movement in mechanics and to direct force in all its forms, is a craft capable of numerous possibilities.

There is a good deal of originality in some modern American locks, chiefly in those designed for meeting heavy risks, such as for the doors of bankers' vaults and safe deposits. For these purposes key locks have given place to keyless combination locks, and in many cases these are supplemented or else controlled by time locks. Time or chronometer locks are usually made with three movements and are wound up and set to allow the door to be opened at some predetermined hour before closing it for the night. A recent modification of this has been to dispense with the combination locks entirely, and to rely exclusively upon the timer for security. In this case even the handle to move the main bolts is discarded, and the necessary energy for shooting and subsequently withdrawing these bolts is provided by powerful springs. The timer controls the action of these springs. Thus it is possible to have a perfectly solid door through which no hole of any kind exists.

In the construction of vaults for guarding bullion and specie it is necessary to employ metal which, if attacked by burglars, shall be hard enough to resist drilling or other cutting instruments and at the same time sufficiently tough to resist fracture from blows. Numerous have been the attempts to produce a metal having both these qualities. That which according to the writer's experience has been found to give the best results is a species of armour plate manufactured by the well-known firm of Cammells, Sheffield. It is made precisely like the plates for warships, only, of course, not as thick. Some important work in this material is now under construction, and each piece or slab is rigidly tested before being incorporated in the structure.

Bolts for securing the doors of vaults have received considerable attention from inventors—more attention in England than America. In the latter country the revolving round bolt holds sway, but here there are numerous kinds. That system with which the writer is particularly connected is one in which the bolts do not shoot out at right angles to the edges of the door, but are made to do so in diagonal directions. Some point upwards and others downwards, with the result that when they are all shot out they dovetail their door to its surrounding framework.

It hardly falls within the scope of this paper to discuss matters connected with fireproof construction, but it is difficult to pass by the party-wall door of the Metropolitan Building A

without allusion. When the ruins of, say, a burnt-out city warehouse are visited these doors may be seen in various attitudes, some still in place but bent and twisted, others hanging simply on a single hinge, and still others fallen from their wall openings and lying in the midst of *débris*. As to fireproof structure in general the systems are so numerous that it must often be a matter of difficulty which to select. A paper dealing completely and quite impartially with these systems was recently presented at the Institution of Civil Engineers by Mr. Webster, C.E. ("Proceedings," vol. cv.). The writer mentions it because he thinks it may be of value to members of the Society for reference. It may be noted in connection with this, that the result of fire-test experiments on ordinary cement concrete—not on concrete specially prepared to withstand heat—was such as to prove it an unreliable material. Test blocks after being heated and suddenly quenched were found to have lost their strength, and on this account it may be better to use some variety of hard brick for the outer casing of bankers' vaults rather than introduce ordinary cement.

The paper was illustrated by diagrams and models.

IMPROVEMENTS AT EDINBURGH CASTLE.

THE military authorities are at present carrying out at Edinburgh Castle a series of alterations which will have the effect of not only enlarging somewhat the barrack accommodation, but improving the appearance of the large gaunt-looking building which tops the rock on its western side. For some time past, says the *Scotsman*, the accommodation for the men in this building, which is known as the New Barracks, has not been considered by the authorities to be in all respects satisfactory, and it may be remembered that the Duke of Cambridge made pointed allusion to the matter on the occasion of one of his official visits to the Castle. The alterations now being made will go some way towards meeting the suggestions which His Royal Highness then made. Along the western side of the building referred to and on the first floor level—that which is made familiar to the eye by its row of large circular-headed windows—there runs a corridor seven or eight feet wide, upon which the several barrack-rooms on that floor open. The interior wall which divides the rooms from the corridor is to be removed, and each room is to be lengthened to an extent equal to the corridor's width. Then, to preserve the existing communication between barrack-room and barrack-room, a verandah about eight feet wide will be carried along the exterior of the building from side to side. This verandah, which will of course be open, will have some architectural feature to recommend it, and will tend to break the monotonous plainness of the western elevation of the barrack building. It will be breasted by an iron railing about four feet high, and will be covered by a sloping glass roof carried to a height of about fifteen feet upon graceful iron pillars.

ALLEGORY IN ANCIENT ART.

NECESSITY first taught artists to use allegory. No doubt they began with the representation of single objects of one class, but as they improved they attempted to express what was common to many particulars, *i.e.* general ideas. All the qualities of single objects afford such ideas; but to become general, and at the same time sensible, they cannot preserve the particular shape of such and such an object, but must be submitted to another shape, essential to that object, but a general one.

The Egyptians were the first who went in search of images of that kind. Such were their hieroglyphics. All the deities of antiquity, especially those of Greece, nay, their very names, were originally Egyptian. Their personal theology was quite allegorical, and so is ours. But the symbols of these inventors, partly preserved by the Greeks, were often so mysteriously arbitrary as to make it altogether impossible to find out their meaning, even by the help of those authors that are still extant, and such a discovery was looked upon as a nefarious profanation. Thus sacredly mysterious was the pomegranate in the hand of the Samian Juno, and to divulge the Eleusinian rites was thought worse than the robbery of a temple.

The relation of the sign to the thing signified was in some measure founded on the known or pretended qualities of the latter. The Egyptian horseman was of that kind, an image of the sun, because his species was said to have no female, and to live six months under and six above ground. In like manner the cat, being supposed to bring forth a number of kittens equal to that of the days in a month, became the symbol of Isis or the moon.

The Greeks, on the contrary, endowed with more wit and undoubtedly with more sensibility, made use of no signs but such as had a true relation to the thing signified or were most agreeable to the senses; all their deities they invested with human forms. Wings, among the Egyptians, were the symbol

of eager and effectual services, a symbol conformable to their nature and continued by the Greeks, and if the Attic Victory had none it was meant to signify that she had chosen Athens for her abode. A goose, among the Egyptians, was the symbol of a cautious leader; in consequence of which the prows of their ships were formed like geese. This the Greeks preserved also, and the ancient rostrum resembled the neck of a goose.

Of all the figures whose relation to their intended meaning is somewhat obscure, the sphinx perhaps alone was continued by the Greeks. Placed in the front of a temple, it was, among the Greeks, almost as instructive as it was significant among the Egyptians. The Greek sphinx was winged, its head bare, without that stole which it wears on some Attic coins.

It was in general a characteristic of the Greeks to mark their productions with a certain cheerfulness. The muses love not hideous phantoms, and Homer himself, when by the mouth of some god he cites an Egyptian allegory, always cautiously begins with "We are told." Nay, the elder Pampilo, though he exceeds the Egyptian oddities, by his description of Jupiter wrapt up in horsedung, approaches, nevertheless, the sublime idea of the English poet:—

As full, as perfect, in a hair as heart;
As full, as perfect, in vile man that mourns,
As the rapt seraph, that adores and burns.

It will be no easy matter to find among the old Greek coins an image like that of a snake encircling an egg, on a Syrian coin of the third century. None of their monuments are marked with anything ghastly; of these they were, if possible, still more cautious than of ill-omened words. The image of death is not to be seen, perhaps, but on one gem, and that in the shape commonly exhibited at their feasts, *viz.* dancing to a flute, with intent to make them enjoy the present pleasures of life by reminding them of its shortness. On another gem with a Roman inscription there is a skeleton with two butterflies as images of the soul, one of which is caught by a bird, a pretended symbol of the metempsychosis; but the performance is of latter times.

It has been likewise observed that among those myriads of altars, sacred even to the most whimsical deities, there never was one set apart to death, save only on the solitary coasts which were deemed the borders of the world.

The Romans in their best times thought like the Greeks, and always, in adopting the iconology of a foreign nation, traced the footsteps of these their masters. An elephant, one of the latter mysterious symbols of the Egyptians (for there is on the most ancient monuments neither elephant nor hart, ostrich or cock, to be found), was the image of different things, and perhaps of eternity, as on some Roman coins, because of his longevity. But on a coin of the Emperor Antoninus, this animal, with the inscription "Munificentia," cannot possibly hint at any other thing but the grand games, the magnificence of which was augmented by those animals.

But it is no more my design to attempt an inquiry into the origin of every allegorical symbol among the Greeks and Romans than to write a system of allegory. All we propose is to defend what we have advanced concerning it, and at the same time to direct the artist to the images of those ancients in preference to the iconologies and ill-judged symbols of some moderns.

We may, from a little specimen, form a judgment of the turn of mind of those ancients, and of the possibility of subjecting abstracted ideas to the senses. The symbols of many a gem, coin and monument enjoy their fixed and universally-received interpretation; but some of the most memorable, not yet brought to a proper standard, deserve a nearer determination.

Perhaps the allegory of the ancients might be divided, like painting and poetry in general, into two classes, *viz.* the sublime, and the more vulgar. Symbols of the one might be those by which some mythological or philosophical allusion, or even some unknown or mysterious rite, is expressed. Such as are more commonly understood, *viz.* personified virtues, vices, &c., might be referred to the other.

The images of the former give to performances of the art the true epic grandeur. One single figure is sufficient to give it; the more it contains, the sublimer it is; the more it engages our attention, the deeper it penetrates, and we of course feel it the more.

The ancients, in order to represent a child dying in his bloom, painted him carried off by Aurora—a striking image, taken, perhaps, from the custom of burying youths at daybreak. The ideas of the bulk of our artists, in this respect, are too trivial to be mentioned here.

The animation of the body, one of the most abstracted ideas, was represented by the loveliest, most poetical images. An artist who should imagine he could express this idea by the Mosaic creation would be mistaken, for his image would be merely historical, and nothing but the creation of Adam—a history altogether too sacred for being either admitted as the allegory of a mere philosophical idea or into every place; neither does it seem poetical enough for the flights of the art.

This idea appears on coins and gems, as described by the most ancient poets and philosophers: Prometheus forming a man of that clay of which large petrified heaps were found in Phocis in the time of Pausanias, and Minerva holding a butterfly, as an image of the soul, over his head. The snake encircling a tree behind Minerva, on the above coin of Antoninus Pius, is a supposed symbol of his prudence and sagacity.

It cannot be denied that the meaning of many an ancient allegory is merely conjectural, and therefore not to be applied on every occasion. A child catching a butterfly on an altar was pretended to signify *Amicitia ad aras*, or, "which is not to exceed the borders of justice." On another gem, Love, endeavouring to pull off the branch of an old tree where a nightingale is perching, is said to allegorise love of wisdom. Eros, Himeros and Pathos, the symbols of Love, Appetite and Desire, are represented, they say, on a gem, encompassing the sacred fire on an altar; Love behind the fire, his head only overreaching the flames; Appetite and Desire on both sides of the altar; Appetite with one hand only in the fire, with the other holding a garland; Desire with both his hands in the flames. A Victoria crowning an anchor, on a coin of King Seleucus, was formerly regarded as an image of peace and security produced by victory, till by the help of history we have been enabled to give it its true interpretation. Seleucus is said to have been born with a mark resembling an anchor, which not only he himself but all his descendants, the Seleucidæ, have preserved on their coins.

There is another Victoria with butterfly's wings fastened on a trophy. This, they say, is the symbol of a hero, who, like Epaminondas, died in the very act of conquering. At Athens such a statue and an altar to an unwinged Victoria was the symbol of their perpetual success in battle; ours may admit of the same explication as Mars in chains at Sparta. Nor was she provided at random with wings usually given to Psyche, her own being those of an eagle; they perhaps signify the soul of the deceased. However, all these conjectures might be tolerable if a Victory fastened on trophies of conquered enemies could reasonably correspond with their being vanquished.

Indeed, the sublimer allegory of the ancients has not been transmitted to us without the loss of its most valuable treasures. It is poor when compared with the second kind, which is often provided with several symbols for one idea. Two different ones, signifying the happiness of the times, are expressed on coins of the Emperor Commodus: the one a lady, sitting with an apple or ball in her right and a dial in her left hand, beneath a leafy tree; three children are before her, two in a vase or flower-pot, the usual symbol of fertility; the other represents four children, who, as is clear by the things they bear, are the seasons. Both have the subscription "*Felicitas temporum*."

But these and all the symbols that want inscriptions are of a lower rank, and some of them might as well be taken for signs of different ideas. Hope and Fertility, for instance, might be Ceres, Nobility, Minerva. Patience, on a coin of Aurelian, wants her true characteristic, as does Erato, and the Parcae are only by their garments distinguished from the Graces. On the contrary, ideas which are often confounded in morality, as Justice and Equity, are extremely well distinguished by the ancients. The former is represented, as drawn by Gellius, with a stern look, a diadem, and dressed hair; the latter with a mild countenance and waving ringlets, ears of corn arising from her balance as symbols of the advantages of equity, and sometimes she holds in her other hand a cornucopia.

Peace, on a coin of the Emperor Titus, is to be ranked among those of a more energetic expression. The goddess of Peace leans on a pillar with her left arm, in the hand of which she holds the branch of an olive-tree, whilst the other waves the caduceus over the thigh of a victim on a little altar, which hints at the bloodless sacrifices of that goddess; the victims were slaughtered out of the temple, and nothing but the thighs were offered at the altar, which was not to be stained with blood. Peace usually appears with the olive-branch and the caduceus, as on another coin of this emperor, or on a stool placed on a heap of arms, as on a coin of Drusus. On some of Tiberius's and Vespasian's coins Peace appears in the act of burning arms.

On a coin of the Emperor Philip there is a noble image: a sleeping Victory, which with better reason may be taken for the symbol of confidence in conquest than for that in the security of the world, as the inscription pretends. Of an analogous idea was the picture by which the Athenian general Timotheus was ridiculed for the blind luck with which he obtained his victories; he was represented asleep with fortune catching towns in her net.

The Nile, with his sixteen children, is of this same class. The child that reaches the ears of corn and the fruits in his cornu is the symbol of the highest fertility, but those that overreach them are signs of miscarrying seasons. Pliny explains the whole. Egypt is at the height of its fertility when the Nile rises 16 feet, but if it either falls short of or exceeds that

measure, it equally blasts the land with unfruitfulness. Rossi in his collection neglected the children.

Satirical pictures belong also to this class: the ass of Gabrias, for instance, which imagines itself worshipped by the people as they bow to the statue of Isis on its back. It is impossible to give a livelier image of the pride of the vulgar great.

The sublimer allegory might be supplied by the lower class had it not met with the same fate. We are, for instance, not acquainted with the figure of Eloquence or Peitho, or that of the goddess of comfort, Parergon, represented by Praxiteles, as Pausanias tells us. Oblivion had an altar among the Romans, and perhaps a figure, as may also be supposed of chastity, whose altar is to be found on coins, and of fear, to which Theseus offered sacrifices.

However, the remains of ancient allegory are not yet worn out, there are still many secret stores; the poets and other monuments of antiquity afford numbers of beautiful images. Those who in our time and that of our fathers were busy in improving allegory and in facilitating the endeavours of the artists, those, we say, should reasonably have had recourse to so rich and pure a fountain. But there was an epoch to appear in which a shocking crowd of pedants should, with downright madness, conspire in an universal uproar against every the least glimpse of good taste. Nature in their eyes was puerile, and ought to be fashioned; blockheads, both young and old, vied in painting devices and emblems for the benefit of artists, philosophers and divines, and woe to him who made a compliment without dressing it up in an emblem. Symbols void of sense were illustrated with inscriptions giving an account of what they meant and meant not; these are the treasures which are dug for even in our times, and which, being then in high fashion, outshone all antiquity had left.

The ancients, for instance, represented munificence by a woman holding a cornucopia in one hand and the table of the Roman Congiarium in the other, an image which looked too parsimonious for modern liberality. Another therefore was contrived with two horns, one of them inverted, the better to pour out its contents; an eagle, the meaning of which is too hard for us to guess at, was set upon her head. Others painted her with a pot in each hand. Eternity was by the ancients drawn either sitting on a globe, or rather sphere, with a hasta in her hand; or standing with the sphere in one hand and the hasta in the other; or with the sphere in her hand and no hasta; or else covered with a floating veil. These are the images of Eternity on the coins of the Empress Faustina; but there was not gravity enough in them for the modern artists. Eternity, so frightful to many, required a frightful image—a form female down to the breast, with globes in each hand, the rest of the body a circling star-marked snake turning into itself.

Providence very often has a globe at her feet and a hasta in her left hand. On a coin of the Emperor Pertinax she stretches out both her hands towards a globe falling from the clouds. A female figure, with two heads, seemed more expressive to the moderns. Constancy, on some of Claudius's coins, is either sitting or standing, with a helmet on her head and a hasta in her left hand; or without helmet and hasta, but always with a finger pointing to her face, as if closely debating some point. For distinction sake the moderns joined a couple of pillars. It is very probable that Ripa was often at a loss with his own figures. Chastity, in his iconology, holds in one hand a whip (a strange incitement to virtue), in the other a sieve. The first inventor perhaps hinted at Tuccia, the vestal, which Ripa not remembering, indulges the most absurd whims, not worth repeating.

By thus contrasting ancient and modern allegory, we mean not to divest our times of their right of settling new allegories; but from the different manners of thinking we shall draw some rules for those that are to tread these paths. The character of noble simplicity was the chief aim of the Greeks and Romans, of which Romeyn de Hooghe has given the very contrast. His book, in general, may very fitly be compared to the elm in Virgil's hell:—

Hanc sedem somnia vulgo

Vana tenere ferunt, foliisque sub omnibus hærent.

The distinctness of the ancient allegory was owing to the individuality of its images. Their rule (if we except only a few of those above-mentioned) was to avoid every ambiguity—a rule slightly observed by the moderns—the hart, for instance, symbolising baptism, revenge, remorse and flattery; the cedar, a preacher, worldly vanities, a scholar, and a woman dying in the pangs of child-birth. That simplicity and distinctness were always accompanied by a certain decency. A hog signifying among the Egyptians a scrutator of mysteries, together with all the swine of Cæsar Ripa and some of the moderns, would have been thought by the Greeks too indecent a symbol of anything whatever, save only where that animal made part of the arms of a place, as it appears to be on the Eleusinian coins. The last rule of the ancients was to beware of signs too near akin to the thing signified. Let the young allegorist observe these rules, and study them jointly with mythology and the remotest history.

NOTES AND COMMENTS.

THE fifteenth annual general meeting of the members of the Royal Scottish Society of Painters in Water-Colours has just been held in Edinburgh. The president, Mr. FRANCIS POWELL, R.W.S., was chairman. The secretary, Mr. J. WRIGHT ROBB, submitted the balance-sheet, and read his report, in which reference was made to the exhibition of the Society, and the success attending the same. The income for the year amounted to 312*l.* 17*s.* 9*d.*, and the expenditure to 280*l.* 13*s.* 9½*d.*, leaving a surplus of 32*l.* 3*s.* 11½*d.* on the year's working. The balance at the credit of the capital account now amounts to 883*l.* 2*s.* 2*d.*, being an increase of 67*l.* 3*s.* 11½*d.* since last year. The following were appointed office-bearers:—President, FRANCIS POWELL, R.W.S.; vice-president, WILLIAM M'TAGGART, R.S.A.; treasurer, A. K. BROWN, A.R.S.A.; auditors, WILLIAM YOUNG and JOHN SMART, R.S.A.; secretary, J. WRIGHT ROBB.

THE following papers will be read at forthcoming meetings of the Applied Art Section of the Society of Arts:—On February 7, "Pottery Glazes: their Classification and Decorative Value in Ceramic Design," by Mr. WILTON P. RIX. On February 21, "Wall-papers and Stencilling," by Mr. T. R. SPENCE. On April 11, "History and Development of Pattern Designing in Textiles," by Professor PAUL SCHULZE. On May 9, "Primitive Art in Egypt," by Professor FLINDERS PETRIE. Mr. LEWIS F. DAY will begin a course of four Cantor lectures upon "Some Masters of Ornament" on April 10. Mr. C. HARRISON TOWNSEND will give two lectures upon "The History and Practice of Mosaics" on May 8 and 15.

It has been determined to erect a statue of ANTOINE WATTEAU, the most charming of the French painters, at Nogent-sur-Marne. He was born at Valenciennes, and there he ought to be honoured. WATTEAU's connection with Nogent was of brief duration. He suffered from weak lungs. One of the priests of Paris prevailed with a gentleman living at Nogent to invite WATTEAU to dwell in his house. But the artist did not long survive the change, and died at Nogent in 1721. We have as much reason to erect a statue of WATTEAU in London, for he was at least a year there. But so fine a genius merits to have more than one memorial, and we wish success to the committee of artists who have undertaken to collect funds for the statue in Nogent.

IN the New Quarterly Statement of the Palestine Exploration Fund there is a curious note on "Mud Showers and their Effect on Buildings in Palestine," by the Rev. J. E. HANAUER. He says that he happened to spend a Sunday at Nazareth last May. About fourteen years had elapsed since he had visited the place, and he was very much surprised at the change that had during that time taken place in the colour of buildings there. The Protestant Church, for instance, which in 1878 was fresh, white and conspicuous, had weathered into a light brown or yellowish tint, and was difficult to distinguish from other buildings near it; whilst, from the same causes, it was scarcely possible to recognise the Orphanage, situated on the hillside high above the town, and which, when new, could easily be seen at a great distance. On his return to Jerusalem Mr. HANAUER gave attention to the colour of buildings there. The first discovery he made was that whilst the city walls and towers were, generally speaking, both externally and internally, grey on their northern and western faces, which are most exposed to rain, yet that their southern and eastern faces, whether external or internal, were of different shades of tawny yellow, ochre or brown. Closer examination showed that this remarkable difference of colour in the eastern and southern faces from that of the western or northern was due, not merely to greater exposure to sunshine and protection from rain on the east and south, but to the presence of a curious coating or pigment, varying, according to the hardness of the stone it adhered to (or to the angle of protection and cover afforded by projections or buildings near), in the shades of

yellow, ochre and brown; and further, that these tawny patches of colour are found not only on old buildings such as the city walls, the Church of the Holy Sepulchre, and minarets, &c., but also, and with equal richness of colour, on some modern ones known to have been built before 1860, for instance, on the south wall of Christ Church, and on the oldest part of Bishop GOBAT's School. These observations led Mr. HANAUER to make special inquiries on the subject, and he was told by several old European residents that the yellow colour was caused by a remarkable shower of yellow mud which fell about thirty-five years ago. Professor ROTH, of Munich, examined this yellow mud and found it to consist of sand similar to that found in some parts of the Sinaitic peninsula and to contain many minute shells also found in that region. The rain of clay happened in the year 1857, probably in February. There were showers of rain before, then scirocco came for a few days. That evening the sun disappeared, and then, in the night, there followed a shower of rain which brought down all the very fine dust in the air. All channels were stopped up with a sort of fine clay of yellow colour, and everything exposed was painted yellow, but the following rains washed off a good deal. "Gakooli" stones, however, remained yellow, as they usually become by the process of exposure to sun and rain, whereas harder stones keep the natural colour. Such a rain mingled with clay has since then fallen on several occasions, but only slightly, and never in any quantity worthy of comparison with that above mentioned. Sometimes small shells fall with it or may be detected in the sediment. The phenomenon does not appear to have been noticed before, although it has much to do with the appearance of Eastern buildings.

THE Mahârâja of JEYPUR is a prince who is enthusiastic about art, and especially architecture. He has already expended large sums on building, and it will be remembered that his engineer, Colonel JACOB, recently described in London the efforts of the Mahârâja to secure large measured drawings of the details of Indian work, which were afterwards lithographed. He now proposes to erect a palace, and application has been made to the Madras Government to authorise the consulting architect to prepare a design. As in India there are now several English architects who depend mainly on non-official commissions, they are not satisfied with a proposal which would give an important work to a functionary who should have claims on all his time by his duties. An aggrieved architect, in a letter on the subject in a Bombay paper, says:—"Both as a taxpayer and an architect I protest against permission being granted a public official on full-time pay to design and carry out large works for native princes or any private persons whatsoever. There is not the slightest excuse for this plan of supplementing official salaries by the oblique road of what is euphemistically called honoraria, but which practically amounts to underselling private practitioners. Neither the Government nor the public need be informed at this time of day that there are several able and even eminent architects whose lives are cast in private practice in India, and for public officials on regular salaries to enter into competition with them and take, so far as they are allowed, the bread out of their mouths—this, I say, constitutes not only a grievance but a scandal. It is not the policy of Government to blast, but to encourage private enterprise, and the Home Government only the other day set a notable example of this in binding the highest law officers of the Crown to be content with their salaries and not to compete in private practice with the members of the Bar. So long as outside practitioners of unchallengeable position are to be found in India, no public works officer has any right to interfere with their prospects or career." It may be a question of policy to sacrifice occasionally the interests of civilians in order to insure the presence of a great many military engineers in India. But official architects would not be expected to take prominent parts if the Russians arrived. There is no need, therefore, to adopt extraordinary measures to encourage them to remain in India. If private architects with or without the aid of ghosts in London can design a costly palace for the Mahârâja, the Government should allow them fair play.

IN designing a bank for the great financial company, it was fitting that French Renaissance should be employed. Everybody assumes that architecture, as many other things, is better managed in France than among us, but we imagine that the directors of the *Crédit Lyonnais* would be the first to acknowledge that Messrs. DAVIS & EMANUEL have been as successful as any of the numerous French architects who were employed to erect banks and offices for the company. The illustration is from a photograph by Messrs. BEDFORD, LEMERE & Co.

THE CATHEDRAL, MAYENCE.

WE have to apologise to many correspondents who have written to us complaining of the delay in the publication of PROUT's drawings. As we explained on a former occasion, there are many causes which interfere with the regular production of the parts of a series in a journal like *The Architect*. As the whole of the plates are now on stone, subscribers may be confident that they will receive all the examples of PROUT's works, which we have undertaken to produce.

NEW PREMISES, LLOYDS BANK, LIMITED, BEXHILL-ON-SEA.

THESE premises, recently completed at Bexhill for Lloyds Bank, Limited, were erected from drawings prepared by Mr. ARTHUR WELLS, F.R.I.B.A., Hastings, and erected by Mr. PETER JENKINS, builder, St. Leonards-on-Sea. The arrangement of the bank is shown on the ground-floor plan, above which is the manager's residence, with private and back entrances. The upper part of the building is set back by reason of the estate regulations as to the building lines. The building has been constructed of local red bricks; the moulded bricks have been manufactured by Messrs. KENWOOD & Co., of Beauport, near Hastings; the roof is covered with Elterwater (Westmoreland) green slates, and the doors and sashes to the banking-room are of polished teak. The tile floorings were supplied by Messrs. MINTON & Co., the ornamental ironwork by the Coalbrookdale Co., and the constructional ironwork by Messrs. ROWNSON & DREW.

WHAT IS ARCHITECTURE, AND HOW CAN IT BE ADVANCED?*

I THINK this age is foolishly ungrateful to the fine arts. This ingratitude is mainly due to ignorance, though partly to the low ideal standard of the age, and to its enrichment through scientific discoveries. If the bulk of people were asked the uses of the fine arts, they would probably say they were innocent recreations, to be classed with cards, billiards and dominoes; yet if they would take the trouble of examining the furniture of their own minds, they would find that nearly all they know, and nearly all they feel, was due to the teaching of the fine arts. If men of science were excluded, and if it were possible to extinguish in the rest of Christendom all that has learned from poetry, eloquence, the drama, dancing, music, painting, sculpture and architecture, in what would it differ from its ancestors, the monkeys, except by having clothes, money, and the multiplication-table?

Painting, sculpture and architecture present finished pictures of some beauty, art or emotion which it is important for mankind to be acquainted with, and it conveys this lesson at once; and the other fine arts do the same in a short space of time. It is, too, the chief method that nature herself adopts for our delight and instruction; the sublimity, the beauty, the solemnity, or the ugliness nature presents us with in her works strikes us at once. We are equally moved by the howling of the winds, the crash of the thunderstorm, the fury of the sea, the rumbling of the earthquake, or the explosion of the volcano. No laborious investigations are wanted to produce our emotions from these causes; and this is necessary, for man has to get his living by work, and must lose the emotions of delight or horror, and the lessons they convey, if they could only be got by laborious discovery of nature's laws, or by the patient following of her procedure. Far be it from me to depreciate science, which has in astronomy acquainted us with the marvels of nature's sublimest work; has given us at once new views of the Creator's procedure, and has discovered innumerable laws that are applied to our use. But while we are astounded at "yonder hundred million spheres," we should not be ungrateful for

"all the silvery gossamers that twinkle into green and gold." It is neither my part, nor my wish, to depreciate any one, much less the great men who have devoted themselves to science, and have conferred such benefits upon us; but I certainly do wish to make artists and their arts appreciated, and to show the inestimable gifts they have conferred, and do confer, on mankind. It is only when we know that it is mainly through the fine arts that Christendom is in the van of civilisation that we can appreciate the gross ignorance of those who overlook them, and the black ingratitude of those who depreciate and decry them. Mr. Eidlitz, in his "Nature and Function of Art," truly says:—"The true artist . . . becomes a teacher and prophet to his race whether he knows it or not. Poetry and painting, music, the drama, sculpture and architecture depict emotions which, by a process of mental contagion, generate sympathetically other emotions, and thus teach men to feel ideas which they could not comprehend in their abstract form." We can spare no art and no science, for each science reveals to us that particular mystery it studies, while each fine art not only has its own particular expression, but is lord of that country that no other fine art can invade; so that if one could be lost mankind would be deprived of that part of instruction and delight that it conveys, and that all the rest of the fine arts together could not supply.

The first inception of almost all the works of the fine arts is under some strong emotion, and when the artist deals with words they naturally flow in a rhythmical form. When the poem is long the poet has by the vividness of the picture in his mind and by his art to sustain that emotion in his finished work. His emotion is twofold, that caused by the conception itself and by his desire to excite the same emotion in his hearers. Until lately the words of poetry were enforced by music. Burns spoiled his most exquisite song, "Ye Flowering Banks of Bonnie Doon," because no composer he knew could fit it with a suitable tune. The subjects of poetry were written in verse, not only because it is the form that impassioned language takes, but because verse is more easily remembered than prose, and for the latter reason brevity is a merit. Hence the poet not only compressed his sentences, but used happy words that suggested much, as "The starry Galileo with his woes." The more vivid utterances and pregnant sentences of the poet were impressed on the minds of the hearers, so that language is very much of a mosaic, made up of the striking phrases of the poets. In the days of antiquity Homer's poem was the bible of the Greeks. Soul-stirring strife and tragic episodes abound in it, while the avenging of wrongs, the defending one's country, the contempt of pain and death, the exercise of hospitality and the due worship and reverence for the gods formed a moral code, and the incidental pictures of life both at home and in a far-off country made it delightful.

It may be remarked that the faith of antiquity was mainly gathered from the poets, for they were looked on as inspired by the divinities.

For he on honey-dew hath fed,
And drunk the milk of Paradise.

The real poet is inspired by the age in which he lives, but we may say that his poetic temperament has been bequeathed to him by his parents, who mostly lived in times when every fibre was in tension from wild hopes and desperate fears. The Trojan War, the invasion of Greece by the Persians, the Roman struggle with Carthage and its civil wars, the Crusades, the emergence of Florence, the change to Protestantism, the defeat of the Armada, the defeat of the Royalists, the wars of the end of the eighteenth century and the French Revolution were each followed by a galaxy of poets. The great poet, too, reacts on his age as its seer and prophet. We see an example of this in the late Poet Laureate, in whose works all the mental conflict of the age between the old and new faith, between knowledge and wisdom, are depicted, and a fair hope of progress is held out to humanity through the increase of knowledge, wisdom, courage, goodness and faith. These lessons and incitements, combined with the accurate portrayal of inanimate nature, of the great passions of mankind, of pageants and battles, of mysterious dreams and the ecstasies of saintly warriors and anchorites, made him the great poet of his age, whose words are on everyone's lips, and truly he treated our language as a skilful engraver treats a gem. Lawgivers, warriors, statesmen and even philosophers had learnt long before Horace's time that for their gifts or victories to be kept alive it was necessary to be sung by a poet, and for the same reason the winners of the Olympic games were allowed to dedicate a statue or painting of themselves, or a poem in their honour. We see how splendid literature gives to mortal things the nearest approach to immortality.

Many, many have lived who were valiant in fight,
Before Agamemnon; but all have gone down,
Unwept and unknown in the darkness of night,
For lack of a poet to hymn their renown.

* A lecture by Mr. G. Aitchison, A.R.A., delivered at the Royal Academy on Monday, January 23.

I must not devote too much time to this most fascinating subject, but to take only the novel of the day, how vividly we

remember the striking scenes, the unravelling of characters both good and evil, and how much of our current cultivation and morals is due to them; but literature deals with words and time alone, if we except the melody of verse and prose, and it can therefore only perfectly depict the words we speak and hear, what we think and what we feel; all else that it does is to suggest by words what we see.

Dancing, like singing, is a spontaneous manifestation of high spirits and joy, which naturally express themselves in rhythmical movements or sounds, and have been enlisted in the service of religion. We have all read of David dancing before the ark. The mountaineers who come to Rome at Christmas to sing carols not only enforce the words by the sounds of the bagpipe, but dance at the same time, and if asked to cease their dancing, which is not particularly graceful, say that the act of adoration is not complete without the dancing. Some of the most beautiful bas-reliefs of antiquity represent the frantic dancing of the Mænads. The drama shows us the action and expression of each person, lets us not only hear the language proper to each, but the tone of the voice, with its accent and cadences under emotion, and consequently we are more readily moved by it to tears or laughter, to hatred, indignation or contempt, than by any other fine art, but it is as perishable as a dream. The twin arts of sculpture and painting gave rise to their overmastering rival, written literature, but in combination they were the books of remote antiquity, and as there is no reason why sculpture should be white, they are but different developments of the same art; but this modern liking for sculpture in the white has perhaps caused it to be more exquisite in form, for if the colour of a picture be unpleasant we do not look at it, but fine sculpture does rivet our attention on its perfections in spite of its whiteness.

It is difficult to restrain oneself within proper bounds when speaking of the divine and entrancing art of painting, which preserves for us all the power and loveliness of the present, and conjures up for us all the glories of the past. In the mind's eye we see the roll of painters and their works, like Banquo's line of kings, from Giotto to Reynolds, from the seraphic visions of Raphael and the majestic picturing of Michel Angelo, through the divine harmonies of Giorgione, Titian, Schiavone and Paris Bordone, of Tintoretto and Paul Veronese, till we come to the depiction of the noble bearing and stately beauty of the lords and ladies by Moroni, Vandyke, Gainsborough and Reynolds, and those superb representations of the houses of the Netherlands by Peter de Hooze, and the episodes of its life in his compeers. To speak only of Italian religious pictures, they may be said to have given its current theology to Italy, as Milton's "Paradise Lost" is said to have given it to England. I may say that it is through the absence of pictures that so little is known in England of its history and achievements. In addition to these we have the whole range of landscape-painting from Peter Paul Rubens to Turner.

As we have two kinds of figure-painting so we have two kinds of landscape-painting, the one which depicts for us some particular piece or phase of loveliness or sublimity, and the other which calls up the emotion produced on the painter by some scene, beautiful, mysterious or terrible. The limitation of painting as compared with literature is that time does not come within its range, and I fear we are not now intimately acquainted with expression, while from the necessity in this climate of clothes, the ignobleness of their forms and the absence of artistic grouping, the depiction of contemporary life is scarcely fine art when it is without beauty or sentiment. Men in their natural state would probably group themselves as artistically as sheep in a field, but even sheep cease to be artistically grouped in a pen, and since artistic grouping has ceased, except on the stage, artists are driven to isolated instances of beauty or power and to the portrayal of the past.

Music, I am informed, is subject to mathematical rules in its composition, and to ears cultivated to comprehend it, it raises high and vivid emotions, and it does in some degree affect most of us. I have grouped architecture with music, partly because it has been called "frozen music," and partly because much of its beauty is owing to mathematical proportion, it is one of the visual fine arts that is not directly imitative; so I think we must first ask ourselves how it affects the completely ignorant, and I think it does so by its imposing mass. Ammianus Marcellinus says that Constantius, when he visited Rome, admired the vast mass of the Amphitheatre, and the Pantheon, with its vast extent, its imposing height, and the solid magnificence of its arches. Beholders judge of the nation by the objects for which vast buildings have been erected. The emotions of the less ignorant are, I think, mostly produced by the exhibition of work; in the case of Gothic, by finely pierced work; we hear—in France, at least—workmen and their wives admiring it, and declaring it looks like lace. These emotions are mingled in the educated, but, according to their cultivation, some more admire mysteriousness and exaggeration, while others more admire the grace and subtlety of proportion, and both admire beauty of outline. In most archi-

ture there is an inside as well as an outside, but except in religious monuments the inside can only be seen by the owner or by a select few. In some religious monuments the most impressive internal feature is the lighting, and this is especially so in Hadrian's Pantheon at Rome, whose lighting has a magical and weird effect, and it is only after several visits that attention is given to anything but the dome. Externally its size is by no means so apparent; the vast dome on its circular walls is more appreciable inside and more sublime, and at last we perceive the charm of its composition and its general finish. Sta. Sophia is, perhaps, the next most striking interior; its vastness is overwhelming, while the diffusion of light from hidden sources is marvellous, and afterwards we are awed by the great dome, seemingly supported on nothing. St. Mark's, I think, strikes us most by its richness, and there is at least a feeling of satisfaction that everything looks secure. Most of the Gothic cathedrals produce admiration by their height and length, and, when seen from the west end, for the endless repetition of vertical lines and diffusion of light from unseen windows.

In a few cathedrals, such as Strasburg, where the nave is very light, the gloom of the apse, with its masculine, Romanesque pillars, is impressive. At Seville and at Durham the massiveness of the piers are most noticeable; they look as if they had been built by Titans, and that these cathedrals are halls of Eblis. Milan is not striking inside or out, unless you see the outside by moonlight, or the inside at dawn on a winter's morning, when the interior is nearly dark, with a faint star of light from some altar, the piers looming darkly in the surrounding gloom, their capitals concealed by rolling mist, while the ambos form two black masses. Yet, for all this, many churches and cathedrals look imposing enough at vespers in the winter, with but one small chapel lit up, which glows within the gloom. I recollect being struck with Sta. Maria Maggiore on such an occasion, and with many of the French cathedrals.

Secular buildings are naturally much less striking, though this is scarcely true of the vast halls of the Roman baths. The Loggia dei Lanzi is one of the most striking, and of modern ones, the old Schloss at Berlin, with its plastered front and rococo details. To an architect the first impression of the Ducal Palace is the apparent want of support for the heavy-looking superincumbent mass, just as in Gothic cathedrals one asks oneself, How is it that the vault stands? It is not surprising that architectural monuments being so obtrusive, so gigantic, and sometimes so beautiful, should have forcibly impressed themselves on the minds of great poets and writers, so that literature is full of allusion to them, from "the cloud-capp'd towers" of Shakespeare to "cloisters, branch'd like mighty woods," of the late Poet Laureate. It is superfluous to speak of Satan's Classical palace in Milton, of which he says:—

Not Babilon,
Nor great Alcairo, such magnificence
Equal'd in all their glories.

De Quincey tells us that, in his opiate dreams, architectural visions haunted him, and Wordsworth, in his description of some clouds, saw nothing but architecture:—

The appearance, instantaneously disclosed,
Was of a mighty city—boldly say
A wilderness of building, sinking far
And self-withdrawn into a wondrous depth,
Far sinking into splendour without end!
Fabric it seem'd of diamond and of gold,
With alabaster domes and silver spires,
And blazing terrace upon terrace, high
Uplifted; here, serene pavilions bright,
In avenues disposed: there towers begirt
With battlements that on their restless fronts
Bore stars—illumination of all gems.

Think what architecture has done for the dumb nations of the past, for Egypt, Assyria, Persia and Mexico, who without it would be lost in oblivion. It points out, with a force second only to poetry itself, the grandeur and importance that a nation once enjoyed, and the point of civilisation it had reached. Mr. Ruskin is even more eloquent than usual on the effect of architecture in recalling memories:—

It is as the centralisation and protectress of this sacred influence that architecture is to be regarded by us with the most serious thought. We may live without her, and worship without her, but we cannot remember without her. How cold is all history, how lifeless all imagery, compared to that which the living nation writes, and the uncorrupted marble bears! how many pages of doubtful record might we not often spare, for a few stones left one upon another? The ambition of the old Babel builders was well directed for this world. There are but two strong conquerors of the forgetfulness of men, poetry and architecture, and the latter in some sort includes the former, and is mightier in its reality; it is well to have not only what men have thought and felt, but what their hands have handled, and their strength wrought, and their eyes beheld all the days of their life. The age of Homer is surrounded with darkness, his very personality with doubt. Not so that of Pericles, and the day is coming when we shall

confess that we have learned more of Greece, out of the crumbled fragments of her sculpture, than even from her sweet singers or soldier historians. And if, indeed, there be any profit in our knowledge of the past, or any joy in the thought of being remembered hereafter, which can give strength to present exertion, or patience to present endurance, there are two duties respecting national architecture whose importance it is impossible to overrate: the first to render the architecture of the day historical, and the second, to preserve, as the most precious of inheritances, that of past ages.

Again, like poetry, the remains of architecture help to raise barbarous nations to civilisation, for as Virgil inspired Dante, so did the remains of Roman and Byzantine architecture inspire the savages and barbarians that overran Europe and the East, to imitate and improve on what they found. Architecture ran a continuous course, though with some gaps, from Greek to Mediæval days, through Roman, Byzantine, Saracenic, Romanesque and Gothic, and though in most cases it lost some of its refinements, it must be called a progressive art up to the end of the Gothic period, for it not only embodied the thoughts and aspirations of various nations at various epochs, but it made continuous progression in construction, if we consider that at certain epochs it was taken up by savages and barbarians, who naturally knew nothing. And in the most civilised times, after the fall of Rome, the means at the disposal of the various nations were but slender. Gothic architecture attained a mastery of construction that has only been equalled by the engineering works of to-day, and a new æsthetic expression in tendency, outline and detail that is only to be compared with Saracenic, though Gothic surpassed it; for though the Renaissance did something to improve the appearance of architecture, it was by the adoption of exotic art, and it stopped both its constructive improvement and its æsthetic propriety.

It is unnecessary to ask what are the models in nature of figure-sculpture and painting, but we may well ask what are those of architecture. It is true that some hints may be got from nature in the forms of mountains and rocks—near Amalfi a stretch of isolated rocks looks like a Mediæval town—but these hints can but rarely be used, so I think we may fairly ask what architecture is, and I think we may say it is an effort of man to produce an organism so far resembling one of nature's that it answers its purpose completely, and, like hers, occasionally causes emotions in the beholder, but always has a distinct character.

Nature, as far as we know, not only does her work completely and perfectly—while man does his in a bungling way—but she makes her works answer other ends by means of the first, and, if we may say so, without effort, while man must use great effort to accomplish the two. We can scarcely doubt that the shapes of leaves affect plants electrically, and thus enable their roots to assimilate the different qualities of the soil in which they grow. Some assimilate that which becomes food for man, and some poison, while at the same time the forms affect us by their beauty or ugliness; but be they beautiful or be they ugly, they have a marked character.

The only comparison we can make between architecture and any of nature's organisms is in the case of animals with shells; but it is merely a superficial resemblance, for although the snail is said to carry his house on his head, it is merely a figure of speech. It is not its house, but a part of the creature, for the shell, I believe, acts as the fulcrum for its muscles. Some shells, and some shell-fish, strike us as peculiarly beautiful, some as commonplace, some as quaint or repulsive; but we have no reason to believe that one is less perfectly fitted for its purpose than another. The common crab is a quaint-looking creature, if not an ugly one; while the king crab looks as if it were designed by a Greek artist. Perhaps the simplest shell man ever made for a living man was an anker; but in this the anchorite ate, drank, slept and prayed, and though this cell had no door, it must have had an opening for breathing, for the introduction of food and the admission of light. I think, then, we may affirm two things; that except in the case of the anker the poorest shell we make is originally for a group of two, for the human unit is a man and a woman; and, secondly, that it will have a marked character if it is made to suit its use thoroughly, and is built properly. This character must mainly be got by making the proper arrangements for what the human unit does in its habitation, by the requirements in putting it together, and by the materials employed. Consequently we must know how these materials act, and how they can be properly put together. All matter acts according to laws, and the law which makes ponderous substances stand is statics. So we must at least understand this science, either by theory or practice. Some philosopher has said that "ornament is more natural to man than clothing," for naked savages have been found who have stained, coloured, or tattooed themselves in patterns.

I think, however, that what is now mostly called architecture did not arise directly from the gradual desire of man to improve his dwelling, but from a desire to appease or propitiate his chief deity; and as the savage had no model

but his cave or his hut, most early temples are but glorified caves, huts or houses. The Greek temple, which is undoubtedly the most perfect architectural work of early civilised man, and which has in certain respects never been equalled, was palpably a glorified hut; for though Fergusson insists most strongly that it had a different origin, we must believe Pausanias, who saw one of the original oak columns of the Temple of Heré at Elis, and the wooden pillar of the house of Enomaus was kept in his time as a sacred relic; and besides this, every part of the Greek temple points to its wooden prototype. Man, too, hungers for immortality; and the child, as the type of the savage, hungers for it too, but rather for those he loves and respects than for himself. So large stones, or heaps of stones, and mounds of earth have been raised by savage or half-civilised man to those who have benefited him, and they have also been used to mark great events.

It would be something for us all to know what architecture is, and very much for the student, for without knowing this he may follow a will-o'-the-wisp all his life and find himself in a quagmire at last. Architecture, from the first written record of it that has come down to us in Vitruvius, was treated as the art of building properly, and in a book of much more importance than Vitruvius and nearly as old, the New Testament, the architect is called "a wise master builder," and it was not, I think, till 1849 that we were informed that it had nothing to do with building. In "The Seven Lamps of Architecture" we are told "Architecture is the art which so disposes and adorns the edifices raised by man, for whatsoever uses, that the sight of them contributes to his mental health, power and pleasure." It is very necessary, in the outset of all inquiry, to distinguish carefully between architecture and building. To build, literally to confirm, is by common understanding to put together and adjust the several pieces of any edifice or receptacle of a considerable size. Thus we have church-building, house-building, ship-building and coach-building. That one edifice stands, another floats and another is suspended on iron springs makes no difference in the nature of the art, if so it may be called, of building or edification. The persons who profess that art are severally builders, ecclesiastical, naval, or of whatever other name their work may justify; but building does not become architecture merely by the stability of what it erects, and it is no more architecture which raises a church or which fits it to receive and contain with comfort a required number of persons occupied in certain religious offices, than it is architecture which makes a carriage commodious or a ship swift. I do not, of course, mean that the word is not often, or even may not be legitimately, applied in such a sense (as we speak of naval architecture); but in that sense architecture ceases to be one of the fine arts, and it is therefore better not to run the risk, by loose nomenclature, of the confusion which would arise, and has often arisen, from extending principles which belong altogether to building into the sphere of architecture proper. Let us, therefore, at once confine the name to that art which, taking up and admitting, as conditions of its working, the necessities and common uses of the building, impresses on its form certain characters venerable or beautiful, but otherwise unnecessary. Thus, I suppose, no one would call the laws architectural which determine the height of a breastwork or the position of a bastion. But if to the stone-facing of that bastion be added an unnecessary feature, as a cable moulding, that is architecture, by which we see that the architect is only a decorator of walls; and Fergusson, though he did not state it so crudely, had much the same idea, for the gross building should, according to him, be so superabundantly strong that it could be cut away where wanted for æsthetic reasons. He no doubt was thinking of rock-cut temples; but I think, without wasting our time on refutation, we may cast all such whims and oddities to the winds. You might safely incise a stone wall or a column, or put on either a slightly raised pattern, or cover a wall with plaster for painting or for mosaic, or you might veneer it with marble; but if you wished to enrich any part by deep carving without knowing anything about building you would put the building in jeopardy and probably cause it to fall, not to speak of losing the pride and boast of architecture, that she has created an organism in imitation of nature's own work. To show the paramount importance of constructive knowledge, I may say that even such masters of practical construction as the Mediæval architects were not always fully equipped; the abutments of vaults were generally not quite strong enough for the thrusts, as may be seen in the deformation of the angle piers of the transepts in most cathedrals, and absolute failures were not unknown; the central tower at Beauvais is said to have been built twice, and to have twice fallen.

I think we now know that to be architectural each building must be exactly fitted for the purpose to which it is to be put, that its materials must be properly used, and that the whole must be put together according to the law of statics, which will give us the proper sizes and shapes, and that if we do this thoroughly, even in a hut or cabin, it will have a distinct

character of its own ; but you must not think that because this is easily said it is easily done. Those things, however, we now call buildings are mostly groups of buildings. I think, too, that the common definition of architecture as building to obtain beauty is wrong—it is building properly, so that the true character of the building may be expressed. We certainly do not want to build a prison so that it may look beautiful, but so that it may convey repulsion and horror. We do not want to make a court of law beautiful, but to endow it with awe and respect ; for though law is said to be the perfection of reason, most of us pray to be delivered from the law, the world, the flesh and the devil.

Before we can properly sub-divide architecture we must consider life a little. We all must eat and drink, and I suppose in this climate be clothed ; and if our occupation is not hard, out-of-door work, we must be warmed, and all of us want to have our food cooked—man has been defined as “an animal who cooks his food”—and to be protected from the inclemency of the weather, at night at least. These things are absolute necessities, without which we die. The stores or warehouses that keep these necessities, or the shops that sell them do not raise high or deep emotions in us, except perhaps when we feel we shall die without them. We hardly ask for beauty in a coal store, a wool warehouse, an oyster, tobacco, drinking, or boot shop, but on the other hand, we ask for a certain amount of comeliness in all buildings, except where it would be improper ; for buildings are obtrusive things, and take from us the view at least, often both light and air, and always add to the pollution of a town. We want the highest sublimity we can attain in temples to the Deity, to whom we desire to express our thankfulness and submission ; the utmost stateliness and dignity in buildings for Parliament, as the laws made there ought to add to our happiness, and, good or bad, greatly help in moulding the character of a people, and there the measures are decided which give us peace or war ; grandeur in the mansions of great men who guide, instruct or defend the people, and also in the monuments to those who have preserved or improved the nation ; and some degree of beauty in every house, for it always contains some joy or some sorrow, and the education of the nations is carried on there, for though children may get their schooling elsewhere, most of them get their education at home.

It would be wearisome work, if I could do it, to enumerate the different aspects that each sort of building in a large city should exhibit, but I think we may roughly divide buildings into those for the common necessities for the continuance of life ; monumental, for those devoted to the higher aspects of human feeling and intelligence ; and mixed, for those which combine to minister to both. If man were as capable of making his buildings perfectly fitted to their uses as nature is, we should want no more instruction, for she succeeds in making most of her works beautiful ; and when she does not, it is probable that their repulsiveness is a warning against them, and is thus useful to man. She endows us with our senses, and with their likes and dislikes ; but this was not enough, for when the neglect of these instincts produces illness or death, she usually supplements the lesson by making the filth we accumulate or the unhealthy site we choose for a habitation a breeding-place for annoying or poisonous insects, to again warn us of the risks we run. The capacity of making the purely useful agreeable is far from being given to man. We see engineering structures as perfectly fitted for their uses as very clever and skilful men can make them, but we cannot say that the general result is beauty ; but on the contrary, the beautiful ones are most rare, the bulk of them are ugly, and some are hideous nightmares. We have seen that it is an injury to mankind to put up eyesores, but this is by no means the strongest case in architecture. Engineering works are mostly for commonplace purposes—that is to say, directly or indirectly, for the creation of more food, clothing and warmth ; but the highest class of architectural works, temples, monuments and tombs are mainly for emotional ends, and their object is to create or intensify such emotions, and not to diminish or destroy them. We have only two masters to go to—nature and former works ; and we must recollect that the future is but the unknown quantity, evolved from the present and the past. A great writer says, “The true men of progress are those whose point of departure is a deep respect for the past.”

It may be said—for it has certainly been done—that we have but to copy what produced such emotions in the past, and does still produce other emotions now ; but it must be borne in mind that some of our emotions are not those of antiquity, nor of the Middle Ages, nor of the East, nor even precisely those of our immediate predecessors, and that there is a certain meaning attached to certain architectural forms from their being associated with certain uses, as well as beauty attributed to forms from their constant association with the higher sentiments. The Romans associated the pediment with a temple, and were proportionately shocked and disgusted when Julius Cæsar was allowed to put one on his mansion ; from the same association Cicero thought pediments so beautiful that he

expected to find them in the Elysian fields. We associate a steeple with a church, a dome and minarets with a mosque, and the Mediævals of Italy a tower with a free town. The vast groined halls of the Roman baths suggest to us a Christian church. This must have struck Michel Angelo or the Pope, when the Trepidarium of Diocletian's Baths was turned into Sta Maria degli Angeli.

We ask, in all structures built for us, that our material wants may be satisfied and our emotions excited, when the building is for a use to excite emotion, and our neighbours and all beholders ask that it may not be an eyesore. This is in fact what the craving for novelty means, improvements to suit the wants and tastes of the present time. This at once raises the question that is all-important to this part of the subject, Have we got an architecture that does fulfil all the wants, satisfies the tastes, and expresses all the emotions of the day ? for if we have, nothing further need be said on the subject. But can we as architects truly say that the buildings of the present day give us the exact and perfect arrangement that is wanted, that they exhibit the use of the materials in the precise way in which they are most fitted to their purpose, and that the construction is perfectly adapted to the end in view and to the materials we must employ ? If we cannot affirm this we must admit we have failed, and this mainly applies to the building part ; the æsthetic and the emotional effect will require a fuller analysis. Yet this may be said, that so long as we hear the word “styles” in architects' mouths, we may be sure we have not succeeded, for what is a style in this sense ? It is the expression in building of the wants, the knowledge, the skill and the taste of a people or a nation in a different and in most respects a lower position than our own, whether that people were Greek, Roman, Byzantine, Saracen or Mediæval.

The Greeks and Romans were pagans. Jupiter struck with his thunderbolts people, buildings or towns that were impious. This is hardly our view of the cause of lightning. The captains of ships that sailed or rowed without a chart or compass, and got out of their course in a storm, attributed it to the anger of the gods for some sacrilege committed or some sacrifice forgotten, but this is not our interpretation. Socrates pronounced virtue to be incommunicable because Pericles's son had been taught to ride on two horses, and yet could not govern Athens. An English Prime Minister would hardly send his son to learn riding at Astley's to fit him for the post. Infanticide was not only practised, but was not even strongly reprobated ; they were slaveholders, and believed in witchcraft and the evil eye, and sacrificed living animals. This last we have abandoned—at least, since the old gentleman died in this century, who sacrificed a ram to Jupiter in his back parlour at Stoke Newington.

The Byzantines were orthodox Christians, industrious, turbulent, cowardly and cruel, besides being rotten to the core with corruption. The Saracens were fanatical Mohammedans, fierce and turbulent, torn to pieces by tribal hatreds, without much inventive genius, but with a passion for geometry and mathematics, and were also slaveholders. The Mediævals were at first little better than savages, but settled down, and after the early Crusades made a good deal of progress in the arts, and particularly in architecture. The bulk of the people were serfs, few but the clergy could read and write and all classes were bigoted Roman Catholics, as we see by the Crusade against the Albigenses. Science had scarcely begun to be studied, for the very suspicion of it was heresy. It was a time when, as a great writer says, “the highest result, at least on that planet, our earth, was a choir of priests chanting psalms.” Compare these separate stages with our own, in which science has completely revolutionised our views of our own position in the universe and of its government, in which time and space on this earth have to a great extent been annihilated, in which the most important events in the whole world that happened yesterday are brought to our breakfast-table in the *Times*, when the sun makes pictures for us and the powers of the air light up our houses of a night. Now in England almost everyone can read, write and cipher, and the masterpieces of literature can be bought for the price of a pot of beer. The whole world is better fed, clothed and taught than it ever was. New materials are to our hand, to which marble and granite for their resisting power are almost nothing, and we have advanced the science of statics to a height unknown before, when we can prevent pestilence and unravel the processes of vitality. Surely we must have something else to say in architecture than they had in the sixteenth century, not to speak of the thirteenth.

Taking the culminating period of the Middle Ages as having produced the greatest architectural works the world has seen for the combination of constructive skill with emotional expression, what visions do we see before us of a future architecture if we can make the one step forward—an architecture that will so completely overshadow these masterpieces of the Middle Ages that we shall look upon them as mere antique curiosities, kept only as landmarks to show our progress.

Think of the future temples to truth, to religion, of the buildings where the mysteries of nature are unravelled, where wisdom,

virtue, courage and intelligence are taught, when strength and beauty compete for the prizes, where the last triumphs of science and art are exhibited to the people; the temples where the people are purified, instructed and exhorted before giving their votes; of the tombs or cenotaphs to the benefactors of their country, or the world that will make the tomb of Mausolus seem but a wart.

INFLUENCE OF BYZANTINE ART IN ITALY.

(Paper by Mr. R. Phéné Spiers, continued from page 47.)

I NOW come to the cathedral of St. Mark's, Venice, a building which, inspired throughout by Byzantine work, and of which the main design was certainly due to a Greek architect, seems to me to have exercised the greatest influence on the Lombardian architecture of the twelfth and succeeding centuries. The early history of the present cathedral and of its predecessors has been traced by Cattaneo, to whom I am chiefly indebted for my information. It commences with the recovery of the body of St. Mark by Giustiniani Partecipazio in 829. In that year the Mohammedans of Egypt had determined to pull down the church of St. Mark of Alexandria, and the Doge Partecipazio succeeded in obtaining the relics of the saint in whose memory it had been erected. Nothing remains of this church at Alexandria, but it is believed to have occupied the site of the present Lazaretto. Giustiniani Partecipazio intended to erect a church worthy of these relics, but died before it was commenced, leaving the task to his brother, Jean Partecipazio, who succeeded him as Doge of Venice. The church was built between the site of the then existing Ducal Palace and the church of St. Theodore, which had hitherto been the chapel of the Ducal Palace. The church he built was probably of the usual basilican type, and in it were used up the marble columns and capitals which his brother Giustiniani had exported from Sicily after his conquests there. It is probable also that some of the materials were obtained from the ruined cities of Heraclea, Altino, Concordia, and others, for examples of all periods are found in the present church. In 976 the Ducal Palace was set fire to by an enraged populace, and the Doge, Pietro Candiano, was killed. The fire spread to St. Mark's, and partially destroyed it. The new Doge, Pietro Orseolo, commenced at once the restoration of both palace and chapel, but as he retired to a convent within two years, it is scarcely probable that he can have done more than to restore the old church to its primitive form, and there is no record of a continuation of building in succeeding years. It is quite impossible that so important a structure as the present St. Mark's could have been erected in so short a space of time, and as long ago as 1859 Selvatico, an Italian antiquary, questioned the accuracy of the tradition, having discovered a document in the archives of Venice stating that Dominico Contarini (1043-71) built the church of St. Mark's. 1063 is the date accepted by Cattaneo for its commencement—the same year that the rival Republic of Pisa commenced its cathedral. As Contarini became Doge of Venice in 1043, it is probable that long before 1063 the project was in contemplation. For the provision of ways and means there was no difficulty, as the Treasury of Venice was then richly stored and it was a question of setting forth on some new conquest or building a cathedral; fortunately for us they decided on the latter. Where to place it, however, was another matter. The church of St. Mark's was built, as I have said, between the Ducal Palace and the church of St. Theodore, 16 feet from the former, 32 feet from the latter. Its west front projected quite as far beyond the Ducal Palace as was thought desirable, and a further extension on the east side would only have increased the church to too great a length. The result of the deliberations would appear to have been to pull down a portion of the Ducal Palace on one side and the church of St. Theodore on the other, and to extend the building north and south by the addition of huge transepts. It was here that the Greek architect came in apparently, who showed them that by following the model of the church of the Holy Apostles at Constantinople, they would retain portions of the walls and, without increasing the length, obtain an immense space in the centre. Early records state that the reconstruction was based on the church of the Apostles at Constantinople; this church, however, was pulled down in 1464 by Mohammed II. to build a mosque on the site, so that we have only the description of this church given by Procopius, the historian of Justinian's time, to go by. Now Procopius states:—"In ancient times there was one church dedicated to all the Apostles, but through length of time it had become ruinous, and seemed not likely to stand much longer. Justinian took this entirely down, and was careful not only to rebuild it, but to render it more admirable both in size and beauty. He carried out his intention in the following manner. Two lines were drawn in the form of a cross, joining one another in the middle, the upright one pointing to the rising and setting sun, and the cross line towards the north and south wind. These were surrounded by a circuit of walls, and within by columns

placed both above and below. About the middle point there is a place set apart which may not be entered except by the priests, and which is consequently termed the sanctuary. The transepts which lie on each side of this, about the cross-line, are of equal length, but that part of the upright line towards the setting sun is built so much longer than the other part as to form the figure of a cross. That part of the roof which is above the sanctuary is constructed like the middle part of St. Sophia, except that it yields to it in size, for the four arches are suspended and connected with one another in the same fashion; the circular building standing above this is pierced with windows, and the splendid dome which overarches it seems to be suspended in the air. In this manner the middle of the roof is built; but the roof over the four limbs of the church is constructed of the same size as that which I have described over the middle, with this one exception, that the wall underneath the spherical part is not pierced with windows." Now Procopius was not an architect, therefore we must read between the lines of his description, and when he says the church was surrounded within by columns placed both above and below, he is evidently referring to the columns of aisles and triforium galleries, as in St. Sophia. If that reading be accepted, then the only differences between St. Mark's and the church of the Apostles are—first, there is only one range of columns, viz. in the lower storey, which carry the gallery, and the upper range of columns in wall with windows above, as in St. Sophia, is omitted, the windows being in the outer wall above the aisles; secondly, there are windows at St. Mark's in the four other domes; thirdly, the galleries were replaced by narrow passages in the thirteenth century. Otherwise he might have been describing St. Mark's plan: a Greek cross, with the west end a little longer, dome over the crossing, and four other domes over the limbs, viz. nave, transepts and choir.

Now I have already pointed out that Partecipazio's church, restored by Orseolo, was erected between the church of St. Theodore and the Ducal Palace, 32 feet from the former, 16 feet from the latter; and it is here that the late restorations of St. Mark's have been of such value in testing the validity of the new theory. The wall which separates the chapel of St. Isidore from the north transept, when stripped in 1887 of its marble casing showed a bare surface of bricks, blackened by exposure to the weather, which proved it to be an ancient wall; and, further, a window with stone dressings was found, 9 feet from the ground, fitted with an interlaced wrought-iron grating on the side of transept, and on the other side with the jambs splayed off. This was one of the windows which lighted the south aisle of St. Theodore. The outside of the north wall of nave (now the south side of the north atrium) was exposed in 1885, and it was also found to have been blackened by exposure to the weather, showing it to have been the ancient wall of Partecipazio's church, 76 feet long and 26 feet high. On the south aisle the antæ of the original narthex was discovered, so that it is fair to assume that the south wall of nave below the baptistery and the south aisle, as also the west wall at back of atrium, are both the ancient walls of the original church. If any further proof were required, I think it would be found in the fact that, where an old wall existed, columns were erected against it to carry the vaulting, as in the atrium and baptistery, whilst on the opposite sides it was carried on the wall.

Cattaneo was of opinion that the early church did not extend to the same length as the present cathedral, basing his theory on the existence of a low crypt on the west side of the present crypt and raised choir. Since his death, however, it has been ascertained that this substructure was not a crypt, but was built to carry the floor of the whole structure, and exists throughout, its object probably being to keep the church dry. It is the sinking in the pockets of the arches of this substructure which has led to the wavy surface of the mosaic floor. I had an opportunity in August last (when portions of the pavement in south transept had been taken up to restore the vaults) of tracing out the lines of the arches crossing the church and of the foundation walls of the original basilican church. The west end of the new crypt, therefore, is the same as that of the old one; how far it extended to the east is still a matter of conjecture, but as Cattaneo himself allows, the length of a chancel, including the apse, usually varies between one-third and two-fifths of that of the central nave, and as that is the actual proportion of the existing chancel, there is fair reason to suppose that the inside walls of the three apses are in the same position as that occupied by the original church.

In the reconstruction of the new church, therefore there were certain restrictions, firstly, in the width of nave and aisles, the old walls being retained, and secondly, a limitation in the projection of north and south transepts, as the south wall of St. Theodore and the inner wall of the Ducal Palace were utilised. These limitations have apparently led to a diminution in the diameter of the domes on the north and south transepts, which are 33 feet as against 42 feet, the diameter of the nave dome, and a similar diminution in the choir dome, so as not to interfere with the central apse. The central dome is egg-

shaped, being 42 feet from north and south and only 41 feet from east to west.

Now Contarini died in 1070, and his successor, Dominico Selvo, is said to have commenced the embellishment. It follows that the main structure must have been completed, including the atrium, by that date, and Cattaneo is of opinion that owing to the immense resources they had the task was a possible one; but the structure thus completed bore a very different aspect to the St. Mark's we now see. Externally it was a plain brick building, like the present south transept, its decoration being confined to the brick arches, which with their deep voussoirs have a certain decorative character, to small niches with marble shafts and capitals, to roundels, corbel tables and string-courses. I have endeavoured to make a drawing reproducing the original façade, my conception being based, first, on the walls of the existing structure; secondly, on the reproduction given in Ongania's work of those portions of the ancient structure which were exposed and copied by Mr. Scott during the restoration and on Cattaneo's description. In front of the atrium were five rectangular niches and two small ones, one on each side of the central niches. The extrados of the arches spanning these niches was exposed and covered with lead, as those of St. Saviour at Constantinople. The piers supporting them were decorated with semicircular niches with small marble capitals and brick shafts, and roundels and blind niches above. The gables of the upper storey, as also of the transepts, were also semicircular, but at a lower level than those of the existing transept, about 2 feet 6 inches. This accounts for the indented brick circular string-course which exists in the south transept, and which originally ran round the coping, now raised about 2 feet 6 inches. The existing dome terminals are in timber covered with lead; they were added in the thirteenth century, so that originally the domes were much lower, and the extrados of the arches of the windows were probably exposed, as they are in all Greek churches. I could find no evidence of this, as all the windows have jambs, some of late date, possibly thirteenth century, also the upright portions of the drum have been refaced and the drums raised. As regards the exterior, it is certain that many of the capitals, columns, balustrades, jambs and lintels were taken from older structures, and that the original church and that of St. Theodore furnished at least a portion. Examples of all periods are found in the present church, including Roman capitals and those of the fifth century onwards. The decoration of the exterior took two centuries to carry out, not including the fourteenth-century florid work of the upper gallery and pinnacles, and every vessel which set out for the East was required to bring back columns, capitals and marbles of all kinds to enrich the great church which, in this respect alone, is absolutely unique. There is no example in the East which suggests a precedent for the singular decoration of the exterior of the atrium with rows of columns on two storeys, and the only parallel instances I am acquainted with are those of the churches of St. Gilles and of St. Trophime at Arles, of the eleventh century, where columns carrying architraves are set close together with figures between; and here the idea was certainly taken from the Maison Carrée at Nîmes, except that they borrowed the idea of a peristyle for the purposes of a wall decoration. To go through the various portions of the cathedral would be beyond the limits of my paper, and would require two or three evenings instead of one. In 1150 the galleries were reduced in width to give increased light to the aisles and chapels. The great arch outside the chapel of St. Isidore was erected in the thirteenth century. The baptistery was decorated with marbles and mosaics in the fifteenth century, but the columns, capitals, with dossier and vault, date from the early structure. The chapel of St. Zeno was originally the entrance to the atrium from the south porch, there being also an entrance in the north porch known as the Porch of Flowers (Porta delle Fiori). The vault of the nave and aisles extends over the west atrium. On the south side two bays project, viz. over the south porch and the entrance to baptistery, and these formed, according to Cattaneo, open loggias; in the former is a semi-spherical vault intended, doubtless, to be decorated with mosaic. It is an interesting example of brick domical construction of the period. On the north atrium are four chambers all vaulted with domes. All these are parts of Contarini's building.

It is only necessary for me to draw your attention to the photographs on the walls (which illustrate a portion only of the treasures of St. Mark's), and you will be able to judge for yourselves of the enormous influence which such work was likely to exercise on the development of the Lombard style, and that not only in Venice herself but in all those towns with which by sea or land she was in constant communication. Mr. Jackson's work on Dalmatia and Istria will show you how great an influence was exercised in Venice by the Byzantine churches in those countries, a debt which was repaid afterwards when in succeeding centuries they were ruled by Venice. If I have not mentioned Dalmatia and Istria specifically before it is because I have included them generally with Eastern countries. But as to the influence of St. Mark's, so enamoured were the Venetian artists with Byzantine work that down to the Renais-

sance period they frequently copied it with such accuracy as to deceive all but experts, and many of the wells reported to be eleventh or twelfth-century work are, according to Cattaneo, reproductions of the fourteenth and fifteenth centuries. There is a favourite string-course with leaves turned over, the design of which comes originally from Constantinople, in Monas-tes-Koras (Kakriyeh Djami), which is found throughout St. Mark's, in St. Donato, Murano, in the early palaces of the Grand Canal, which I came across in a palace at Ancona, and I have no doubt could be found elsewhere, which testifies to the general favour which it met in the cities of North Italy.

The cathedral of Torcello, an island about eight miles to the north of Venice, was founded in the seventh century, and although reconstructed since, still possesses some of the Byzantine capitals which were used up in the first church. Of this church the central apse and fragments of the baptistery still exist. In 864 the external walls would seem to have been rebuilt, and two minor apses added, one on each side of central apse. A crypt was then formed under the latter, the floor of the apse raised, and the range of marble seats and bishop's throne erected. To this period also belongs the rich interlaced work of the west doorway. In 1008, when the son of Doge Orseolo became Bishop of Torcello, the nave arcade was rebuilt, and thirteen of the eighteen capitals date from this period, as also the marble enclosure to the choir, the panels of which are Byzantine in treatment if not actually carved by Greek artists.

By the side of the cathedral is the church of St. Fosca, originally a basilican church of the ninth century, but modified and partly rebuilt in 1008. There is a special interest attached to the changes which then took place, because they may possibly have suggested the rebuilding of St. Mark's on a Byzantine plan. The model, however, on which it is based is one of the later type of Greek churches, in which the central dome is carried on detached columns. They had, however, a very vague idea how to build pendentives, and still less conception of what the thrust of a dome was likely to be, and I should doubt if it was ever attempted. By throwing small arches across the angles they managed to arrive at the circular base for the dome, and then probably left off, the church now being covered with a timber roof, the exterior of which has the appearance of being the original covering. The capitals of the interior are fine examples of Byzantine Corinthian. Those of the octagonal arcade are barbarous attempts to invent new forms with Byzantine ornament.

The central apse, which was rebuilt in 1008, is polygonal externally, which shows its Byzantine origin. Underneath the cornice we find the earliest example of these triangular panels, which were afterwards adopted in the church of St. Donato, in the island of Murano, two miles from Venice—with this exception, that in St. Fosca the triangular recesses are filled with decorations in stucco, whilst at Murano, being much closer to the eye, they are filled with marble incised panels. There is no doubt that these panels, which are only incised and of simple execution, were produced to fit the places, and not the converse, as is suggested by Fergusson. The church at Murano was built towards the close of the eleventh or beginning of the twelfth century, and possesses many fragments of interlaced pattern slabs of the eighth and ninth centuries. The two large slabs which stand between the upper arcade at each end of the west part bear so great a resemblance to the panels of the choir at Torcello that they may have been carved by the same Greek artists. The apse of Murano is also polygonal.

The position of Ancona opposite the Dalmatian coast, and its facilities of communication with Venice by sea, would naturally bring it within the sphere of Byzantine influence. I have been quite unable to get any information as to the history of the churches here, so that it is difficult to decide their dates. The three churches of interest, so far as my subject is concerned, are the Duomo, dedicated to St. Ciriaco, St. Marie in Piazza, and St. Marie Misericordia. The latter is a square church on the plan of a Greek cross, with dome in centre carried on four piers. There is no Byzantine detail except a pulpit of the eighth century, evidently carved by native artists who attempted to copy Byzantine work.

St. Marie in Piazza possesses an extremely rich west façade, with an unusual screen of arches one above the other carried by small shafts. The wall behind these has been panelled with marble slabs carved with interlacing Byzantine ornament, which comes irregularly behind the shafts. I came to the conclusion on the spot that, in imitation of St. Mark's at Venice, the architect of the first church inlaid the upper portion of his façade with marble slabs from some more ancient building. At a subsequent date, finding that they were being outdone by St. Mark's, and being unable to command the supply of marble columns and capitals enjoyed by the Venetian Republic, they employed a Lombardic artist to decorate the front in his own way, and we have in this remarkable decoration the result of his efforts. The Byzantine leaf cornice is found both inside and outside of the church, which I should assign to the end of the eleventh century or beginning

of the twelfth, and the arcading fifty to seventy years later. Subsequent additions have much altered the upper part of the façade, and the aisles have been raised and partially rebuilt.

The Duomo or cathedral is variously ascribed to the tenth or eleventh century, but it contains Byzantine capitals and other treasures of much earlier date. I should ascribe it to the end of the eleventh century, and the plan seems to me to have been taken from St. Mark's of Venice. It is in the form of a Greek cross (not including the extension of choir at a later date), and it consists of nave, transepts and choir, all with side aisles, and a central ribbed dome of twelve sides, carried on a drum, and pendentives of the twelfth century. The nave, transepts and choir are all covered with timber roofs, and there are crypts under both transepts and choir. The capitals are all Byzantine with dossierets, and in the balustrade of the parapet to south transept there are eight marble slabs with incised work, originally inlaid with mosaic, four of which must, I think be of Greek workmanship, as they are carved with birds and animals which have their prototypes in Greece. The inscriptions, however, on other examples stored in the crypt are in Latin, as also those on the figures or face of the slabs or parapet to south transept and others encased in the façade rebuilt in the thirteenth century. The inlaid ground of those in the transept had all been taken out, but in the crypt one of the slabs still retains its cement inlay, with three or four pieces of glass, which suggested that they were tesserae from which the gold surface had been chipped off. I have tried in various ways to obtain more information respecting these slabs, but in vain, and as I unfortunately arrived in Ancona two days before some fête, and before I left the whole church was enveloped in red drapery and the windows covered with veils, I was unable to copy any of the inscriptions.

Owing to the paucity of examples in Lombardy prior to the eleventh century, we are unable to trace the earlier developments of what is termed the Italo-Byzantine style, to distinguish it from the Romano-Byzantine and the Lombardo-Byzantine phases. The few churches which remain and to which I have already referred, of the ninth and tenth centuries, still retain the simple basilican form with timber roofs. Early in the eleventh century, however, a new and important element is introduced in the desire to erect churches the construction of which should be fireproof, in other words to vault the nave and aisles of their churches. This had for centuries been done in the East, in fact, after the erection of St. Sophia all the churches were vaulted. De Dartein does not recognise any Eastern influence in this respect; at the same time he is bound to allow that it may have inclined the architects of the West to make an attempt in the same way. The domical form given to the webs of all the Italian examples is so marked and is so widely different from the early Roman vaulting, which at that time still remained throughout the country, that it is only fair to suppose that the early Italian builders may have profited by the lesson set them in the East. Be that as it may, it is quite certain that with the introduction of vaulted naves an altogether different plan of pier or support was required in the place of the ordinary basilican column, and the favourite Byzantine composite or Corinthian cap could not be used up again. They were obliged, therefore, to invent and carve a new combination of capital which should meet the requirements of the compound or clustered pier.

The dossieret was given up, or rather its place was taken by an abacus of less height decorated with interlaced work or scrolls, or leaf ornament of various kinds. It had no longer the same great projection, for here we return again to the old Roman system in which the arch or architrave or wall above is in the same plane as the pier or shaft below the capital.

In the Byzantine capital animals or birds are rarely carved, the eagle, the lion, the lamb and the ram's head occasionally taking the place of the volute, and supporting the angles of the abacus; but are probably not found in more examples than 3 to 5 per cent. In the Italo-Byzantine capital it is almost the reverse. Animals and monsters and figures of all kinds decorate their capitals, relieved with interlaced work of various patterns. Though bold and vigorous, the carving of these animals is very barbaric, and it is only when they reproduce those animals or bird forms which occur occasionally in Byzantine capitals that the treatment is properly conventionalised and good. In fact, the finest capitals of the eleventh and twelfth centuries are those in which the artists have felt the influence of Eastern work and tried to reproduce it.

In the church of St. Michele, at Pavia, carved work of three periods may be traced. First, the early Lombardic work of the eighth or ninth century—animals of barbaric type taken from an earlier building and built into the eleventh-century façade. Second, Lombardic Byzantine panels, which are utilised in the jambs of the portals. And third, the mingling of these two elements in the carved work specially executed for the church. The same is observable in the church of St. Ambrogio at Milan, where the jambs and arch-moulds of the west doorway would seem to have been taken from the earlier ninth-century church. Some of the carving in this church

seems to be of earlier date than St. Michele, but I am inclined to think that is due to the existence of much Roman work in the town. In St. Eustorgio and St. Celso, also in Milan; in St. Pietro in Celo d'Oro at Pavia; SS. Pietro and Paolo, Bologna; St. Savino at Piacenza; the cathedral of Parma, and other churches of the twelfth century, we find a magnificent series of capitals, showing a wonderful fertility of design, and, as time progressed, of knowledge and finish of execution. One of these churches, St. Pietro in Celo d'Oro, is dated 1132, and in allowing fifty years earlier for the first developments of the style in St. Ambrogio, Milan, and St. Michele, Pavia, and, perhaps, twenty to thirty years later for St. Celso at Milan, we should probably not be far wrong, though some authorities, among them M. de Dartein, are inclined to give a much earlier period. Towards the close of the twelfth century the Byzantine influence dies out, and in the baptistery of Parma there is scarcely any trace; the concave sections given to the leaves and tendrils are replaced by convex, and interlaced work is seldom employed.

The Byzantine influence in Venice, Padua, Vicenza and Verona lasted a much longer period. The church of St. Antonio at Padua, built between 1232 and 1307, is the most notable example, but only in the plan and the main features of the building, in which they have attempted to reproduce a new version of St. Mark's. It is in the form of a Latin cross, and is crowned with eight domes.

Along the Grand Canal in Venice are the remains of seven or eight Byzantine palaces of the eleventh, twelfth and thirteenth centuries. The most remarkable of these is the Fondaco dei Turchi, a building which has lately been entirely restored, I might say rebuilt, none of the ancient marbles being retained. I fortunately purchased on my first visit to Venice two photographs of the building in its original decayed condition, but of which there remained sufficient sound material to have been embodied in the restoration. The Venetians, however, wanted to have a new building, and allowed their architect to exercise his ingenuity in the design of an upper storey or series of gables, which I am sure never existed in the old building. In the Casa Loredan, Casa Farsetti and other palaces we find the original arcade and fenestration which formed the foundation of what is known as the Venetian Gothic style, such as is found in the Ca d'Oro, the Foscari and other palaces. The arches of these Byzantine palaces are all stilted, and in their hood-moulds they employ always what is known as the Venetian dentil, but which is first found in St. Sophia of Constantinople. This dentil is found in all the Venetian palaces down to the end of the fifteenth century, and also at Padua, Vicenza and Verona. All the capitals which carry these arches are of Byzantine character, doubtless copied by the Venetian artist from those of the models in St. Mark's, and the leaf cornice to which I have directed your attention reigns throughout.

The Byzantine influence in Lombardy, I have said, dies out towards the end of the twelfth century. This, however, is not the case in Venice and in the towns which came within her influence. To go further, however, would take me beyond the period I have selected, and would certainly put too great a strain on the indulgence with which you have listened to my long paper.

I can only express the hope, in conclusion, that I have been able to lay before you clearly, 1st, the essential characteristics of the Byzantine style; 2nd, the sources through which the influence of that style penetrated into Italy; and 3rd, the principal results of that influence. If, beyond these three objects, I have been able to awaken your interest in the high decorative qualities of the Byzantine style, in the variety and beauty of its carved capitals and screens, and last, but not least, in the reticence and simplicity of its masses, I shall not altogether have failed in the object of my paper, although I have not gone to the headquarters of the style. For our immediate purpose as revivalists of principle in architectural design, the unconscious adaptation by a nation of a foreign style may possibly teach us lessons which the study of the originals would at first fail to impart to us.

CLIMATE AND ART IN EGYPT.

PROFESSOR FLINDERS PETRIE, in his lecture at University College on Saturday, said the Egypt of the early monuments was a mere strip of a few miles wide of green, amid boundless deserts, and beneath a sky of the greatest brilliancy; a land of extreme contrasts of light and shadow, of life and death. These conditions were reflected in the art. On the one hand was the most massive and overwhelming construction, and on the other the most delicate and detailed reliefs. On one hand the most sublime and stolid statuary, on the other the course and accidents of daily life freely treated. On the one hand, masses of smooth buildings that far outdo the native hills on which they stand, gaunt and bare, and on the other the vivid and rich colouring in the interiors. Against such a back-

ground of hills and precipices, hundreds of feet high, no architecture but that of Egypt would be able to assert itself. In consequence of the climate also Egypt is a land of great simplicity of life. Where the only necessary is a few handfuls of grain or lentils in the day, where clothing is an encumbrance, and the shadow of a palm tree is enough by day and by night during most of the year, life is reduced to the fewest elements. And this simplicity is reflected in the early art, which is only relieved from bareness and poverty by its majestic and vigorous spirit. This extreme of simplicity is especially seen in the oldest buildings, the temple of Sneferu, at Medum, and that of Khafra, at Gizeh. Another point in which we must look to Egyptian nature, in order to understand their art, is in the drawing of the figures. Most Europeans condemn their drawings as an incongruous mixture of side and front views. This is not the real case. Their drawings are three-quarter views omitting the much foreshortened parts. In an actual photograph of an Egyptian boy, taken without any posing, may be seen the side view of both knees in kneeling, one raised above the other, the whole breadth of the shoulders, both arms apart, the profile (with some part of the offside of the face), a full view of ear, and yet a full eye. There is here every element which is set down as impossible by those accustomed to more rigid beings, but which is true to nature in the Egyptian. The early statues agree very closely in the general character which they show, although the individuality of each is clear. There is a full, firm, sane, able look, great decision and vigour, and no trace of cruelty, pride, or excitement. They appear as one of the noblest races that ever existed, and quite fitted for the gigantic new ideals, which founded the character of Egypt as one of the greatest factors in human history. In all their work, whether in architecture or sculpture, the ideal of this earliest art is gigantic work which impresses us the more by its very simplicity and restraint, and the absence of any attempt to seek an effect which is not solidly produced. We admire the action, and not merely the intention. We have no need to say "this man's ideals were greater than his means," for nothing is attempted which is not perfectly accomplished. Their simple grandeur was a challenge to all the feebler races which have followed, each wondering at that which they could not imitate.

CITY IMPROVEMENTS.

AT the meeting of the City Commission of Sewers on Tuesday—the last during the existence of the present Commission—Mr. Alderman Treloar, the chairman, explained the work done by the Commission during the past year. He said that among the improvements carried out the completion of the widening of Ludgate Hill was the most important. The total length of the thoroughfare was 850 feet, the width, formerly 47 feet, was now 60 feet, and the total net cost to the City had been 230,000*l*. Although that great undertaking was begun with the concurrence of the Metropolitan Board of Works and on the understanding that the Board would contribute one-half of the amount expended on it, the London County Council had repudiated that arrangement, and had hitherto declined to pay one penny towards the cost. Many other improvements of more or less importance had been completed or begun. During last session an Act was passed enabling the Commission and the County Council to make a thoroughfare 40 feet wide between Middlesex Street and Bishopsgate. In 1882 the promoters of the Regent's Canal, City and Docks Railway Company scheduled the Golden Lane site, intending to appropriate it as a terminal station, and the price agreed to be paid to the Commission for the site was 80,598*l*. The scheme was abandoned, and after nine years' negotiations an arrangement had been effected by which the Commission had regained possession of the land, and received 42,000*l*. as representing depreciation of value of land, interest on purchase-money, loss of rates, &c. Great credit was due to the solicitor (Mr. E. A. Baylis) for that satisfactory termination. Due attention had been paid to undertakings before Parliament, and when necessary steps had been taken to protect the rights of the citizens. The Central London Railway Bill necessitated a great deal of consideration, resulting in the Commissioners agreeing, subject to certain conditions, to a scheme for an underground station, with subway approaches, opposite the Mansion House. Access to the station would be by two staircases, formed in the footway in front of the Royal Exchange, and also by six others close by. Connected with those staircases would be subways enabling not only the railway passengers to get to and from the station, but the public generally to cross beneath the roadway at that spot. The Bill had received the royal assent. The artesian well at the artisans' dwellings had been completed. It was hoped that in the future the ample supply of water from this source might be utilised for the inhabitants of the surrounding district. The amounts which could be and were legally charged by the water companies were most excessive, and it

was felt that the Commission should in every way endeavour to bring about some alteration in the present system. He was told that in some cases the amount paid as water-rate was so excessive for the quantity used that it would have been cheaper to have used champagne. Great progress had been made with electric lighting, and, indeed, the street lighting in all the main thoroughfares was virtually completed. It was proposed to light the side streets with glow-lamps. He regretted that as regarded private lighting they were much behind, and every effort should be made to press the matter on. The City of London Electric Lighting Company, when laying down their tubes, took the opportunity in a very enterprising manner of placing other tubes side by side with them, with the view of ultimately using them for telephonic purposes, but they could not so use those extra tubes without the consent of the Commission. Negotiations were now in progress with the view of obtaining from the company some practical advantage for the ratepayers before they gave their consent. Mr. Treloar said he believed that one of the chief duties of any municipal body was street improvement. If further improvements were not from time to time made the City would become inadequate to the requirements of its business. But the public should know that the improvements were for the most part made for the benefit and convenience of the entire metropolis and not alone for the City. There was not a part of London which did not add its quota of traffic to the 1,186,000 people and 92,000 vehicles entering and leaving the City every day. It should also be pointed out that the City had to pay about one-eighth of the amount expended by the London County Council on improvements outside the City.

GENERAL.

The Spring Exhibition of the Manchester Academy of Fine Arts will be opened on February 21 with a *conversazione*. Space has been set apart for architectural drawings and works in black-and-white.

The Dunfermline Art Exhibition closed on Saturday, having been open during seven weeks. Up to the time of closing, pictures to the value of 985*l*. had been sold, as compared with 871*l*. paid at the last triennial exhibition.

The Permanent Collection at the Manchester City Art Gallery has been reopened to the public. The collection now occupies the five galleries on the south side of the building and the chief entrance-hall.

The Annual Prize Distribution of the Clapham School of Art takes place this (Friday) evening, when Mr. P. H. Calderon, R.A., will preside.

A Partnership has been entered into between Mr. Reginald G. Pinder, F.R.I.B.A., M.S.A., of Bournemouth (of the late firm of Kemp-Welch & Pinder), and Mr. J. F. Fogerty, B.E., son of the late William Fogerty, F.R.I.B.A., of Dublin.

The Ramsey School Board have instructed Mr. J. W. Start, F.S.I., architect, of Colchester, to prepare plans for the enlargement of their Parkeston Schools by building a new girls' school for 200, and enlarging the boys' by 100 places.

The Ancient Parish Church of St. Peter, at Lusby, near Horncastle, has been reopened after restoration, under the direction of Mr. Ewan Christian.

The Partnership between Messrs. T. Worthington & J. G. Elgood, architects, in Manchester, has been determined, owing to the recent severe illness of Mr. Elgood. The practice will in future be carried on by Messrs. T. and P. S. Worthington under the style of "Thos. Worthington & Son."

The New Buildings for the parish of All Saints, Plymouth, were opened on Sunday last. Mr. Edmund Sedding was the architect, and Mr. P. Blowey the contractor. The work cost 1,300*l*.

"Pemberton's Parlour," one of the landmarks of Chester, occupying a prominent position on the North Wall, though to outward appearance perfectly sound, has collapsed, and was utterly destroyed, owing probably to the effects of the frost. The tower is believed to belong to the Norman period, and on an inscribed panel it was set forth that it and the adjacent portions of the walls were repaired by the aldermen and murengers in 1702.

A Lecture was given by Mr. T. H. Thomas on "Pre-Norman Stonework in Wales," at the last meeting of the Bath Literary and Philosophical Association. The address was some explanatory notes of a series of photographs of descriptive and ornamental stones at present found in Glamorganshire, which were in fact almost the only existing remains of pre-Norman architecture in that county.

The Local Government Board have held an inquiry at the Town Hall respecting an application of the Bilston Township Commissioners for permission to borrow 2,500*l*. for fitting up and carrying out improvements at the new public baths. There was no opposition.

The Architect.

THE WEEK.

THE decision which was given by Lord COLERIDGE and Mr. Justice CAVE on Wednesday will not satisfy district surveyors, but it will have the effect of preventing the Building Act from becoming more oppressive than it has been hitherto. The circumstances were novel. District surveyors are generally supposed to take cognisance of every intention to erect any sort of structure that can be interpreted as a building. But in West Hackney a house was completed without the knowledge of the district surveyor. Notice was given to carry out alterations in it, and, as the builder declined, he was summoned. He maintained that the surveyor's notice arrived too late; but the magistrate did not take that view, and made an order. The builder appealed. There is no doubt the builder should have lodged the requisite notice; but, according to Lord COLERIDGE, it is the surveyor's duty to be independent of such a notice. His business is to go about his district constantly, and keep his eyes open. The whole machinery of the Act ceased when the building was completed. There might be a sale of the building, and the builder might have retired or died. The responsibility for lapses was therefore temporary; for to suppose that proceedings could be taken afterwards would, according to Lord COLERIDGE, be equivalent to charging the Legislature with an intent to do an outrageous injustice. As district surveyors have too much interest in buildings, they generally take care that the provisions of the Act are carried out in detail; but the decision in the Queen's Bench makes it plain that there are more limitations to the exercise of their office than had been supposed.

WE have already commented on the action which was taken by a contractor for sewers at Workington. He declined to carry out a part of the work in moist ground in the way prescribed by the specification. As his proposal to execute the work in another way was not adopted, he threw up the contract. Afterwards he claimed 7,000*l.* for work already done, and damages, but as the surveyor did not give a certificate the Corporation declined to pay. When the case was tried before Mr. Baron POLLOCK and Mr. Justice HAWKINS, judgment was given for the Corporation. The contractor appealed, and the case was heard in the Court of Appeal on Wednesday. As might have been anticipated, there was no reversal of judgment. The right of the borough surveyor to withhold a certificate was the same as that of any engineer or architect in dealing with a contract. The contractor accepted the surveyor as arbiter of what was to be done. If any alterations were to be introduced, an order for every one of them was to be signed by the town clerk. The position of the contractor was not affected by any defect in the plans. Let it be granted that an impracticable method of dealing with the moist ground was proposed, the contractor was still as much bound to obtain a certificate before he sought payment. As we said before, it was the contractor's business to examine the ground he was to excavate, and in this, as in other matters, we anticipated the judgment of the Court of Appeal. It is no doubt hard on the contractor to have a large sum of money kept from him, and the Workington Corporation can now afford to be generous in dealing with him; but as he agreed to depend on the will of the surveyor, he cannot escape the consequences, however disagreeable. Although our opinion of the case has been confirmed, it is right to say that we were not aware that an appeal was contemplated.

AMONG the experiments which are made with the object of determining the density of the air owing to the population of districts, those which Mr. JOHN AITKEN described to the Royal Society of Edinburgh on Monday should be noticed. He did not use a dust counter, yet he was able to make some curious discoveries on the hazing effects of atmospheric dust, or rather the hazing effects of the products of combustion. The observations extended over a period of two years at Falkirk, which may be considered as the dividing line between the populated and the

sparsely-populated districts of Scotland. If lines were drawn north and west from Falkirk, the quadrant between these lines would include almost the whole of the thinly-populated districts. The amount of haze had been based on estimates founded on the visibility of the hills seen from Falkirk. The result of the mean of about 200 observations was that the limit of visibility increased with the increase of dryness, that the transparency of the atmosphere varied with the direction of the wind, and that the direction of greatest transparency was the direction of the northerly and westerly winds—that is, the winds blowing from the sparsely populated regions; while the direction of least transparency was the direction of the southerly and easterly winds—that is, the winds blowing from the thickly populated regions. Generally speaking, the air was six to ten times as clear with a northerly or westerly wind as it was with an easterly or southerly wind, for the same degrees of humidity. In other words, Falkirk air would be six to ten times more transparent if there were no inhabitants in the district. The extreme limit of visibility for the most transparent atmosphere observed Mr. AITKEN estimated at about 250 miles. The observations may be accepted as fairly representative of the haziness of similar districts, but on investigation some differences would probably be noticed. It is a pity the air loses transparency, but there is no help for the change. Towns cannot be demolished in order that nature may be restored to its original state.

MANCHESTER has contributed so much to the Ship Canal, it might be supposed that the citizens would not seek to increase their burthens. But the announcement that the historic Trafford Park Estate is in the market has created a desire to possess it. There are nearly 1,200 acres, and as the property adjoins Manchester, it would be an invaluable aid to the health and recreation of the inhabitants. At the meeting of the Council on Wednesday, they moved:—"That a special committee be appointed to make an exhaustive investigation into a proposal for acquiring the Trafford Park Estate for the city of Manchester, and to prepare and present to the Council a special report, with a view to advising the Council thereon." The motion was adopted with a single dissident. Unless the owners become over-avaricious, it may be assumed that the property will be secured against all competitors.

THE Leeds School Board would appear to be destined to cause dissatisfaction among local architects, although the designing of schools is confined to them. Leeds is one of the few towns in which there is no Board school by a London architect. At present there is a grievance over the competition for a school to be erected in Darley Street. Only architects who practised in Leeds were allowed to take part in the contest. The drawings were without names or mottoes. The first prize was awarded to Mr. J. M. BOTTOMLEY. Fortunately for himself he set up an office in Leeds a short time before the plans were sent in. Mr. BOTTOMLEY was therefore legally entitled to be considered a local practitioner, and it is not likely the School Board will treat him as if he were a stranger. But the transaction indicates the ease with which the most saving conditions can be defeated in architectural competitions.

IN a letter to the *St. James's Gazette* on "Insanitary London" Mr. ERNEST RÜNTZ offers the following recommendation:—"Let the London County Council apply for an Act to enable them to raise loans—say 'Municipal Mortgage Loans'—having for their object the advancing to house-owners of necessary sums of money for the purpose of the revision of imperfect drains, and to include in such Act powers to enforce the same. This would enable the poorer owners to comply with the compulsory regulations at a minimum sacrifice, if the advances were repayable in small amounts by their being spread over a number of years, upon a repayment system similar to but lower in the scale of interest than building societies. The loan could be issued as a 3 per cent., and the money advanced at 3½ per cent. to 4 per cent. The profit on the difference would pay the cost of the machinery necessary in carrying out such a transaction."

TECHNICAL EDUCATION AND THE LONDON COUNTY COUNCIL.

THE Local Taxation (Customs and Excise) Act of 1890 makes available for aid towards technical instruction in the metropolis a sum of money that would elsewhere serve for the education of a kingdom. Unfortunately there is little hope that aid of the kind will be made to yield all that it ought to do among us. The South Kensington incubus contrives to gain hold of most projects for education outside the universities in this country, and renders them almost powerless for good results. When it was settled that the clerks of the Department were to decide upon the subjects which were to be taught and to be the judges of the schools, the fate of technical education was determined. It was doomed to be as costly a failure as the education in art, for which those officials are responsible.

It is no wonder the London County Council, like other municipal bodies, hesitated about entering on the road to ruin, or that the money from Customs and Excise has been utilised for payment of works in London instead of for amateurish experiments in technical education. At the same time the Council have felt that they were expected to act in the spirit which inspired legislation on the subject, although it failed with arrangements for administration. Accordingly the County Council appointed a special committee on technical education. One of the consequences is a comprehensive report, which has been prepared by Mr. LLEWELLYN SMITH, M.A., B.Sc. It describes the result of an inquiry he made into "the wants of London with regard to technical education, the existing provision to meet such wants, and the mode in which the county could best promote technical education," under the Acts of 1889, 1890 and 1891. The report is most creditable to the author.

It is needless to say that at the present time London possesses a great many establishments which are supposed to impart technical education. They are not all successful, and there is no doubt that the majority of students are not of the kind which the founders wished to attract. It is flattering to professors when the sons of wealthy manufacturers are glad to be instructed by them at rates that are almost nominal; but those youths could obtain training elsewhere without any loss to the State. Able professors always prefer to have the best materials to work upon, and in some of the higher technical institutions it is well known that every comer is not welcomed. Rejected candidates are at liberty to go elsewhere, but it should not be forgotten that the London student who has commenced any branch of industry is a judge that is not easily satisfied. In anything which touches his own work, however remotely, he can discriminate between competency and inexperience. Unfortunately, most of the teachers that appear in technical schools have had no experience in the application of science to industry. They have been crammed with what passes for science under the Science and Art Department, and that perilous stuff is not convincing for a London artisan or apprentice. Mr. SMITH, in his report, says that in the technical classes of the metropolis he could discover only 24,000 students, whereas there ought to be at least 140,000; but when the character of the instructors is considered, it is a wonder there are so many.

County councils, and everybody who may desire to make education available, should bear in mind that competent teachers are the foremost necessity. Commodious buildings and generous rewards are advantages, but they cannot compensate for deficiencies in the masters. The spirit which in the Middle Ages made men brave the perils of land and sea in order to derive wisdom from an expert, who might have to give his lessons in a wood through want of a classroom, is not extinct. Students are still willing to go in quest of knowledge, but they have grown more sceptical than their predecessors, and will not weary themselves to attend on counterfeits.

The eagerness of the London student to acquire knowledge when he knows it is obtainable of the right sort is suggested by the tables of the report. At the Polytechnic, where experience is a condition precedent for teachers, we find there are no less than 348 students of various ages

in the class of building construction. During the session 1891-92 there were 88 between twenty and thirty years of age, and 133 over thirty years attending the building classes. In the carpentry class 80 of the students were over twenty years of age, and among the plumbers 41 were over thirty years. The City of London College, which has also the reputation of having practical men for teachers, has 116 students of building construction. The Architectural Museum, on the contrary, could only attract three students to the class of building construction, although, owing to Mr. F. BROWN's presence, there were no less than 368 in the classes for figure-drawing and painting. Why should the Highbury Institute have 64 students of building construction, with 189 for drawing, while the Camden School has only 2 in the former and 204 in the latter? The Working Men's College has some earnest supporters, but there are only 15 students of construction. The Hyde Park and Bayswater School counts 5 in the class of construction, and 164 in the drawing classes; while the Westbourne Park Institute has 21 in the drawing classes and 49 in the building classes. Out of the 58 students who meet at the Church Institute, Upper Tooting, 39 represent building. The instruction in masonry at the City and Guilds Central Institution deals with the most difficult problems of stone-cutting, and yet there are 41 students of masonry, and 60 students receive manual instruction as teachers. The Finsbury Technical College has gained a name through two of its professors. We find that no less than 394 students attend the classes for electrical engineering. These are only a few samples of the numerous variations in the statistics which are to be seen in the report, and they merit consideration by the County Council whenever there is an appropriation of the surplus from Customs and Excise.

Another subject for consideration is the convenience of students. If technical schools are to be only a sort of mock universities, where things in general of a scientific class are to be treated, it does not matter where they are placed. For dabbles in science and wealthy students the City and Guilds Institution was fitly placed at South Kensington. The position gave a sort of fashionable status to all concerned with the enterprise. But the long ranges of empty rooms will reveal to any one who is able to judge that a worse position could not be found for a building to be used by students who are connected with business. In London, where so much appears to be arranged indiscriminately, there is a sort of connection between businesses and districts. Building, for example, is carried out all over the metropolis, but the men congregate in certain parts. The census returns show that in Fulham, Chelsea and Wandsworth 50 and upwards among every 1,000 of the population are men and boys engaged in building. In Hackney, Lambeth and Camberwell the proportion is 40 to 50 per 1,000. In Kensington, Marylebone, Hampstead, St. Pancras, Islington, Holborn, Shoreditch, Southwark (St. Saviour), Greenwich, Woolwich and Lewisham the proportion is 30 to 40. In St. Olave, Southwark, Stepney, Mile End, Bethnal Green and Poplar it is 20 to 30. In the City and Whitechapel and St. George's-in-the-East it is 10 to 20 per 1,000. From these data it is not difficult to determine the most eligible site for a builders' technical school. For the metal trades Poplar and Greenwich have preference; next come Holborn and St. Saviour's, Southwark. Printers and bookbinders also most abound in Holborn and St. Saviour's, Southwark. Shoreditch and Bethnal Green contain the largest proportion of inhabitants occupied in the wood and furniture trades. The chemical trades are most numerous in St. Olave, Southwark, and the clothing trade in the City, Whitechapel, St. George's-in-the-East, Shoreditch and Bethnal Green. The maps, which are tinted according to the density of population of different trades, suggest why some trade institutions are failures. The reports point out how "in Paris the trades are almost entirely dealt with by centralised institutions, each planted in the heart of the industry in question." For elementary technical instruction in London, Mr. SMITH ascertained there was a conclusion "that classes must be brought as near as possible to his (*i.e.* the workman's) door, any available buildings, such as Board Schools, being used for the purpose;" but they should be "grouped round and leading up to central institutes equipped in the

best manner for practical work, and devoting themselves mainly to some important group of industries in the district."

The grouping of schools around institutes is only a part of a very extensive scheme of systematising which Mr. SMITH recommends, and which comprises the training of technical teachers, the teaching of art, science, technology, manual work, commercial subjects and household economy in London. The establishment of museums, the foundation of scholarships and exhibitions and other means of advancing technical education are treated at length. Mr. SMITH does not propose to set aside the arrangements already made by various bodies; he would increase the efficiency of existing institutions by grants from the London County Council. One of his proposals deserves to be printed in these columns:—

I have suggested above that professorships of architecture should be formed in connection with the teaching university. The inclusion, however, of the training of architects among the functions of such a body would depend on the inclusion of art teaching generally among its faculties. To separate architectural form from other branches of art teaching and put it under an academic body to be taught by lectures and tested by examinations, would be extremely undesirable. The architectural student wants his studios and workshops for practical work—drawing, painting, modelling, carving, &c.—as much as the engineering student wants his laboratory and workshop. Leaving it for the present an open question whether the training of architects should or should not be a university function, we may at least consider the question of a school of architecture as a department of higher education.

The only agencies at present devoting themselves to the training of architects (besides the small amount of teaching done at University College and King's College) are the Royal Academy Schools, the National Art Training School and the Architectural Association.

The Architectural School at the Royal Academy is outside our scope. It is only an evening school, as distinguished from the schools of painting and sculpture in which teaching is given every day. The National Art Training School trains teachers of architectural drawing, but very few architects, and there are only a very few architects attending the District Schools of Art (the greatest number of these being in the life class at the Westminster School). The Architectural Association has for some years carried on courses of instruction for its own members. At the beginning they were taught by voluntary teachers, but now they have been reorganised under paid instructors. Some hundreds of students in all attend these classes at the Association's studio in Conduit Street. The Royal Institute of British Architects examines but does not teach.

The question arises whether the work now tentatively carried on by the Architectural Association, which might at any time fall to the ground, and which at present is confined to members of that Association, could not be consolidated and developed by the aid of the Council into a school of architecture.* The Westminster Architectural Museum, which sadly needs re-housing, could be attached to such a school.

To go into details, however, is premature. It is enough to say that (1) the provision for the training of architects in London is scandalously inadequate; (2) that such training, if improved, would raise the standard of the whole of the building crafts, and that a school of architecture and the building trades could become a centre of influence, giving tone and dignity to all the scattered classes for the various branches of the building trades throughout London; (3) that such training as is being done is chiefly done by a voluntary society with no guarantee for its permanence, and is confined to its members; and (4) that if a move is made to realise the idea of a great school of architecture, the Council would do well to help the project in every way in its power, both by annual endowment and aid for equipment.

The creation of a municipal school of architecture would be a splendid achievement for the London Council.

Whether the municipal funds would be rightly employed for such a purpose remains to be seen. If architects are ever trained at the expense of the public it must be expected that they will make a return by working for a remuneration much lower than prevails at present. Nor is there any reason why the rates should not be also applied to the education of physicians, lawyers and clergymen. If the existing system of education for professions is inadequate and if it cannot be improved unless by the help of county councillors, the outlay for the purpose should be met by payment that will bear a proportion to the expenses. In any case the proposal for training of architects will hardly serve Mr. SMITH's and his committee's cause with the ratepayers of London, and architects will not be grateful for it. But there is some excuse for such proposals, when it is found that so many architects are ready to declare that the majority of their brethren are incompetent.

The amount which Mr. SMITH believes it would be

necessary to grant for the first year to help technical institutions is 80,000/. As there is a likelihood of "leakage" to any extent in expending the money, he insists on the necessity of a central organisation. He suggests the creation of an administrative committee consisting partly of members of the London County Council, and partly of members drawn from the School Board, the City and Guilds Institute, the governors of the Polytechnics and the London Trades Council. He also recommends that "small advising trade committees, representing the main groups of the skilled London trades, should be formed to visit and report to the committee from time to time on the practical teaching of the more purely technical subjects," and there is no doubt inspectors of that class would be efficient. The central organisation would cost 50,000/. a year in addition to the 80,000/. In a year or two it would be necessary to increase the grants to 100,000/.

It will be wise to give serious consideration to the proposals. In England, where individuality is inherent among the people, and where everybody can be independent, co-operative efforts for education are liable to failure. Successive Governments have been unable to make of the Science and Art Department a useful institution. In spite of the laudations which are heard at the annual distribution of prizes, there are few towns in England where the products of the art schools can be taken as worth the expenditure. Mr. SMITH says of the farming system which now prevails in the schools, that it is "so thoroughly bad, both in its effects on the management of the schools, and the remuneration and conditions of tenure, that the County Council would be well advised to insist on its abolition as a condition of assisting the schools." The removal of many other defects in the schools is also indispensable if efficiency is really desired. But, with the best efforts, it will take a long time before manufacturers and practical men can believe in the advantages of technical schools. Experience of the South Kensington system has raised a prejudice against teaching which is in any way supposed to be under Government control, and therefore likely to hamper production by some form of circumlocution. This is exhibited in many ways, and students have often to suffer through it. How far the prejudice can go, and how it affects teaching that is independent of the Science and Art Department, may be judged from one part of Mr. SMITH's report. He commends a suggestion of Professor AYRTON that "leaving premium scholarships" or assistance in money should be provided for students who have gone through courses of technical education, but on that account are not prized by men of business. The Professor says:—"At the completion of the course at a technical college, those who come out at the top or those who have influence get posts at once; those who are not so good, but who have money, can enter at works at a reduced premium; but the poor, fairly good student finds it very difficult to get a start—very difficult, in fact, to enable him to show the manufacturer what he can do. For in consequence of the premium system a student who has passed even creditably through his course, but who is not at the top, and who has neither influence nor money, will not be admitted into a works even to give his services for nothing."

This is a remarkable admission, for it comes from a teacher who has attracted thousands of students in a few years. But as long as the public identify science with South Kensington, we must expect that trained students will be handicapped whenever they try to turn their knowledge to account. From what is said in many places it might be imagined that the world is craving to obtain the help of the students of technical classes. The reality is revealed by what is said by Professor AYRTON. It is not so in other countries. County Councils would, however, be wiser to recognise the prejudice than to ignore it.

Let amateurs say what they will, the best technical education for workmen can be devised in connection with their workshops. The youths and adults who attend schools with pompous names too often imagine that they are taking part in some process which, in a mysterious way, will emancipate them from the drudgery of their trades. The daily toil on works becomes distasteful to them. In England the great need is for intelligent, active, industrious and courageous workmen (there is a superabundance of over-

* See *Architecture: a Profession or an Art?* (edited by Norman Shaw, R.A., and T. G. Jackson, A.R.A.), especially the concluding chapter.

seers in the market), and if the London County Council will keep that end in view and attain it the ratepayers of the metropolis would not grudge an expenditure of 100,000*l.* a year. But if the assisted schools will only turn out a greater number of "science students" of the kind that is approved by the Science and Art Department, then as far as the promotion of industry is concerned the money might as well be cast into the Thames.

CHURCH BUILDING IN ENGLAND.—II.

IN his "Past and Present" CARLYLE wrote:—"The pious munificence of England lies far scattered, distant, unable to speak and say 'I am here,' must be spoken to before it can speak; pious munificence, and all help, is so silent, invisible, like the gods." The Parliamentary paper on "Churches and Cathedrals" is a commentary on his words. For it is not only in the metropolis and the surrounding district that we find evidence of extraordinary munificence in erecting churches, but throughout the country. It is easy to understand that benevolent people would expend money when they found there were crowds without churches near them, but in such cases it might be supposed that plain buildings would meet the requirements. Nor is it surprising that the Duke of NEWCASTLE should expend 30,000*l.* on a church "for the use of his family and others residing in Clumber Park." But what is remarkable is the number of churches for which large sums were contributed in order that they might be made worthy of their services. We shall notice a few of those examples of generosity.

The church of St. Mary, Portsea, cost 46,383*l.* The Admiralty gave 50*l.* and the Church Building Societies 650*l.*; the remainder of the money was mainly contributed by the late Mr. W. H. SMITH, the member for the Strand division. At Toddington, in the diocese of Gloucester and Bristol, the new church cost 44,000*l.* The Earl of ELTON erected St. James's, Kingston (Purbeck), which cost 40,000*l.* At Burton, St. Paul's Church was built, at an outlay of 40,000*l.*, by Lord BURTON, who also contributed 14,000*l.* for St. Margaret's Church and 10,000*l.* for Range-shore Church. The greater part of the cost of Holy Trinity, Burton, that is 30,000*l.*, was contributed by Lord HINDLIFF. For St. Mary, Bury (in the Manchester diocese), the subscriptions amounted to 30,000*l.* Mr. E. S. HEYWOOD paid 36,550*l.* for building the church of St. Augustine, Pendlebury, besides 2,091*l.* for the site. The private gifts for Shelton-cum-Newby Church and Studley Church (Ripon) were 40,000*l.* and 30,000*l.* respectively.

The expense of rebuilding St. Mary's, Southampton, was 30,000*l.*, and the private benefactions came to 29,400*l.* Holy Trinity, in the same town, cost 14,000*l.*, towards which the grants were 375*l.*, the remainder being donations. Mr. W. NICHOLSON paid 22,000*l.* for building Holy Trinity Church, Privett, also in the Winchester diocese. At St. Leonards one church cost 22,000*l.*, a second 17,800*l.*, and a third 9,269*l.*, and at Hastings sums of 10,000*l.*, 9,500*l.*, and 6,200*l.* were expended on new churches, besides 10,940*l.* on restoration. In the Plympton district, 29,000*l.* was laid out on a new church at Revelstoke, besides 20,000*l.* on the restoration of Holbeton Church. Cheltenham stands well in the return, as the outlay on St. Matthew's was 25,000*l.*, St. Stephen's 11,000*l.*, and SS. Philip and James 14,500*l.* The cost of St. John, Scunthorpe, exceeded 20,000*l.*, which was contributed by Lord St. OSWALD. The late Mr. GRIFFITH LLEWELLYN expended 20,000*l.* on St. Catherine's, Raglan.

Leicester appears to have expended no less than 69,685*l.* on new churches and 21,497*l.* on restorations. Large as was the amount, only a seventh was derived from the societies. St. Peter's cost 15,200*l.* and St. Saviour's 20,000*l.* (a gift of the Rev. F. G. BURNABY), St. John Baptist 10,000*l.* St. Saviour's Church, Walthamstow, costing 20,000*l.*, was erected at the joint expense of Mr. J. KNOWLES and Mr. R. FOSTER. The cost of St. Thomas the Martyr, Brentwood, was 21,910*l.*, which, with 410*l.* grants from societies, was subscribed. It was a private gift of 25,000*l.* which enabled the parishioners of Halkyn (St. Asaph) to erect their new church. In Rugby the rebuilding and enlargement of St. Andrew's amounted to

25,000*l.*, derived from voluntary contributions. The Earl of FITZWILLIAM gave 25,000*l.* to erect a parish church at Wentworth.

In the diocese of Manchester large sums have been contributed by individuals. An anonymous benefactor supplied the money required (24,060*l.* 8*s.* 4*d.*) for building St. Benedict's, Ardwick. Mr. C. P. STEWART contributed 16,000*l.* for St. James, Collyhurst. Lord EGERTON OF TATTON gave 10,700*l.* to build St. Clement's, Ordsall. Holy Trinity Church, Ashton-under-Lyne, was erected by Mr. G. HEGINBOTTOM at a cost of 14,682*l.*; Mr. J. WHITEHEAD paid 6,471*l.* for Roughtown Church in the same town, and Mr. J. F. BUCKLEY 7,000*l.* for a church at Greenfield, Stalybridge. Mr. T. GREENHALGH subscribed 48,500*l.* for two churches (All Souls and The Saviour's) in Bolton. Nearly the whole of the outlay on other churches was obtained by voluntary contributions.

Liverpool has not expended more than one-third the amount that was raised in Manchester on account of churches. Although doomed to be in all things far behind its assumed rival, there is no doubt that Liverpool possesses some people who are willing to give as well as to receive. All Hallows, Allerton, costing 20,000*l.*, was built by Mr. JOHN BIBBY. A bequest of 25,000*l.* was given towards the 28,000*l.* required for St. Matthew and St. James, Mossley Hill. Mr. H. DOUGLAS HORSFALL built St. Agnes, Toxteth Park, costing over 28,000*l.*, and Mr. T. F. HARRISON built St. Anne, Stanley, West Derby, which cost 12,000*l.* As a rule, the churches in the Liverpool diocese were cheaper, probably the average might be taken at 5,000*l.* Among the new buildings are St. Stephen, Edge Hill, removed and rebuilt by the London and North-Western Railway (outlay, 14,249*l.*), and St. Aidan, removed and rebuilt by the Mersey Docks and Harbour Board (outlay, 8,000*l.*).

The number of churches erected by single donors, at a cost varying from 10,000*l.* to 20,000*l.*, is very large. Among them are Swarraton (Alresford), 15,000*l.*, by the late Lord ASHBURTON; St. Mary's, Tedworth, over 12,000*l.*, by the late Sir JOHN KELK, the contractor; Llangwrig Church, Bangor, 11,000*l.*, by the late Chevalier LLOYD; St. Paul, Spalding, 16,000*l.*, by Miss CHARMEON; St. John Baptist, Spalding, 12,000*l.*, by Miss JOHNSON; St. Matthew, Surbiton, 20,000*l.*, by the late W. M. COLTHURST; St. Paul, Morton, near Gainsborough, 10,150*l.*, by Sir H. B. BACON; St. Peter, Scorton, 13,000*l.*, by Mr. J. ORMROD; the restoration of St. Laurence, 10,000*l.*, by Miss DENISON; St. Nicholas, Whitehaven, 10,092*l.*, by Miss GIBSON; Altofts Church, Pontefract, 10,000*l.*, by Mrs. MEYNELL INGRAM; St. John, Carlton, Pontefract, 18,000*l.*, by Lord WHARNcliffe; Luttons-ambo, 13,125*l.*, and Helperthorpe, 7,885*l.*, besides the restoration of Kirby Grindelythe, 12,600*l.*, by Sir TATTON SYKES (the figures are said not to fairly represent the cost), and St. Mary, Holmbury, 10,000*l.*, by the late G. E. STREET, R.A. Mr. WATERHOUSE, R.A., has not been as yet called on for so large a disbursement. He appears as aiding with subscribers to raise 1,325*l.* 11*s.* 4*d.* to restore Yattendon Church, and renew bells and organ.

It might be assumed from the return that seeking money for building and restoring is not a troublesome task. "Voluntary gifts," "donations," and "subscriptions" may represent wearisome toil, heart-burning and disappointment for many a clergyman, although those accompaniments of church-work may not be represented. We get an occasional, and it may be an accidental, glimpse of the difficulties when we find the source from whence the 4,505*l.* needed for building St. Paul's Church, Winchester, was tapped by "writing letters to persons in all parts of the country," or at Hagbourne, near Wallingford, where 30,000 letters of request produced only 1,500*l.* The late Mr. BOURDILLON allowed the secrets of his success and his troubles to be buried with him undivulged, for it appears "no account can be found of the way in which he raised the money" (about 2,000*l.*) that restored St. Peter's, Little Horksley. Shareholders are not supposed to be open-handed in these days of scanty and irregular dividends, but directors of charitable institutions will be glad to learn that the 2,610*l.* for St. George's Church, Netherfield, Nottingham, came from shareholders of the Great Northern and London and North-Western railways. Much more can, no doubt, be obtained from the same source by the exercise of tact and perseverance.

When Sir ROGER DE COVERLEY observed the scarcity of steeples west of Temple Bar, he exclaimed, "A most heathenish sight!" It was not only in London, but in most parts of England where that sort of sight was presented. The old knight would now be the first to acknowledge that England, in regard to churches, was transformed. The work was then slow, but our time, as WORDSWORTH said—

Is conscious of her want ; through England's bounds
In rival haste the wished-for temples rise !
Their Sabbath bells' harmonious chime
Floats on the breeze—the heavenliest of all sounds
That vale or hill prolongs or multiplies !

ART AND SANITATION.*

IN addressing you on the subject of the "Fine Arts in Relation to the Sanitary Condition of our Great Cities" I am met by two difficulties—a Scylla and Charybdis—that might appal one who had not set out with a determined purpose or was not sure of his way. The first difficulty is that the work of the artist and of the sanitary engineer seem to stand so very far apart in our minds that I may be challenged with the question, "What have they to do with each other? Speak about either of the two things, and we will listen; but let us have one thing at a time." The second difficulty is, that the two—art and sanitation—are so nearly identical, are so interwoven in their action and reaction, that you may too hastily assume that anything I may have to say regarding their relation to each other must necessarily be obvious and trite.

Now I am not afraid of either of these difficulties. In simply stating them I have left both behind, and am content to let Scylla take care of Charybdis. For when you come to look into the matter, what is art but the science of beauty, and are not beauty and health pretty nearly synonyms? At any rate the two things go very much together. They "keep company," as the lads and lasses say. Where perfect health is there is beauty. Where perfect beauty is there is health. In other words, if health is the foundation of the temple of beauty, beauty is the shrine in the temple of health.

Now I know that I am speaking to citizens of no mean city. I am ready to admit, if you tell me that it is so, that all our great cities are lovely and healthy, and that London is the loveliest and healthiest of them all. But whether this be so or not one thing is certain, viz. that to us it is our home. And when our short English summer is over, and the dark days of winter are upon us, it is a matter of no small moment to us what our home is like. From sunny fields and silvery streams, from sea and lake and forest, from the golden light of the south and the eternal snows of mountain fastnesses, we stream back to London, and we know not whether, when we get up in the morning, we shall be able so much as to see each other's faces across the street. Is London in the month of January a desirable place in which to set up a studio for painting? Is London all that could be desired as an art centre? Is it not worth while to inquire whether we could make our great cities more habitable, more pleasant to live in? That is the question to which I address myself to-night. And I will begin by laying before you a series of propositions to which I invite your assent.

The first is that the progress of art in our country and the free development of some of its finest characteristics have been arrested by the foul condition of the atmosphere of our great cities. The second proposition is that the appliances necessary for the sanitation of our dwellings are not irreconcilable with the laws of beauty. The third is that, according to the law of beauty, as well as the law of sanitation, things are right only in their right place. The fourth is that if you can do nothing better with works of art than smoke them black, like fitches of bacon, your artists will probably (according to the law of supply and demand) give you works suitable for that purpose. My fifth proposition is that any great scheme for the future of national and historic art in England is hopeless so long as this state of things continues. And finally, I shall put it to you that to find a remedy for these evils societies of artists have to look to the Society of Arts. Upon each of these propositions I will say a few words, though, having regard to the limited time at my disposal, they must be very brief.

And first. Do we sufficiently realise how the advance of art is hindered by the insanitary condition of our great cities? Take, for instance, architecture and see how dirt stops the way. How it stops the way, not only of the traffic in the streets—an army of scavengers may cope with that—but how it stops the way of all the splendid developments of decoration, by virtue of which architecture takes rank amongst the fine arts. Just

think, for example, what the façade of a public building might be but for this all-pervading, ever-increasing plague of atmospheric dirt. We need not go back in imagination to the time when our forefathers saw the splendour of Westminster Abbey, its delicate tracery, its shafts of marble, its wealth of statuary, long since lost to us in the veil of black slime that covers everything in London. We need not, I say, go back to the past. We have only to seek out some cathedral in purer air, that has not yet been defiled, to see that the defilement comes not of age but of dirt. Lincoln, for instance, or Winchester or Ely or Salisbury, still show us what magic can be wrought in stone by the wizards we call architects. Why is the loveliness of the natural colour of stone to be seen only by a handful of villagers, or the inhabitants of a small provincial town—why not by the toiling millions of the metropolis? The buildings are there. Beneath their shadow runs the perpetual stream of human life, St. Paul's in the east, Westminster Abbey in the west, each with its own splendour, and the stream of life for ever ebbing and flowing, like the great river that runs between them. But the river is thick with mud, so that the people cannot drink of it; and St. Peter at Westminster, and St. Paul in the City, looking out over the surging masses, cannot see each other, for the air is black with smoke; and the people pass and re-pass, and know not that the grimy objects that fill the niches of the Abbey are amongst the loveliest of the sculptures that the world has ever seen.

But that is only one aspect of the case; it shows how much we lose of the work already accomplished by the great architects of the past. But just consider what we lose in the limitation it places on our efforts to create new forms of beauty. Westminster Abbey is built of stone, and depends for its loveliness on the grace of its structure and the splendour of its sculpture. But art has other resources at her command, and notably amongst these is colour. The façade of Siena Cathedral, or the Duomo of Orvieto, or St. Mark's, Venice, are also full of carving; but amidst the carvings are mosaics; the walls are of marble and porphyry, rich with every change of colour—russet and grey, purple and gold; shafts of malachite; panels of *lapis lazuli*. Why do we in England see nothing of all this? In Orvieto, every public building—I might almost say, every house—is as finely engraved, in proportion to its size, as a signet ring; as delicately coloured by the use of brick or stone, or marble or terra-cotta, as an inlaid cabinet. And then the great west front of the cathedral. The city stands upon a hill, from which you can see, for fifty miles round you, the fair Italian landscape and the beautiful blue line of the Apennines. The sun goes down, and you feel that nature can yield no greater splendour to your eyes than that fair landscape, with the golden light deepening into crimson in the west. But then you turn round and look at the mighty Duomo, flushed with the crimson and gold of the sunset, and you learn what art can do—not to surpass nature, not to compete with her, but to interpret her, to reflect her, to make you understand her better. The great windows flash like jewels, the arches are filled with mosaics of the Apocalyptic vision; every stone is engraved with some story of the saints or of the passion of Christ. And perhaps, as darkness falls upon the city and you walk back to your hotel, you begin to think—what resources of the chisel of the engraver, and the saw and wheel of the lapidary, and the smelting-pot of the worker in mosaic, are lost to our architects, simply because of the foulness of our atmosphere—a foulness not inherent to it, but made ourselves in the innocent process of cooking our mutton chops.

For observe—the fault is not to be charged to our climate. Orvieto, indeed, is on a hill, where the air is always pure, but Genoa and Pisa and Venice and Naples are in reach of the wet, salt mists of the sea, and yet they are beautiful. Ah, no! it is not the climate that we have to fight against. It is the climate plus dirt. It is the climate in unholy alliance with the guerilla contingents of smoke and foul gases that decimate our forces and carry foolishness into the councils of our building committees. Are you going to help us against this enemy? Are you going to clarify the air of London and Liverpool and Manchester and the other dark places of the earth? If it be true that "the dark places of the earth are full of the habitations of cruelty," it is equally true that they are full of the habitations of ugliness. Are you going to give the artist that which he values as his life—that without which life itself is of no use to him—I mean light? If you will enable us to see London, I promise you that art shall make it beautiful to look upon.

Have I said too much about the chimneys? Well, then, let us turn for a moment to the gutter. For we must not be afraid of using rough words, if rough words are necessary to express our meaning. I speak as an artist. If in the utilitarian enterprise of sanitation there is a department which may be called the science of the gutter, there is in the exalted regions of idealism a department which may be called the art of the gutter. And this leads me to my second point—that the appliances necessary for the sanitation of our dwellings are not irreconcilable with the laws of beauty. See how naturally

* A paper on "The Fine Arts in Relation to the Sanitary Condition of our Great Cities," read by Mr. Wyke Bayliss, F.S.A., P.R.B.A., at the meeting of the Society of Arts on January 24.

the aims of the architect fall in with the aims of the sanitary engineer.

For instance, to take a case that comes particularly within my knowledge. In the building of a cathedral it is necessary to provide channels for the flood of water with which a sudden or heavy rainfall will deluge the roof. These channels are made to project in such a manner that the rush of water shall be carried outwards, away from the surface of the walls. But the architect who designs all this is not a builder only, but an artist also. Under his touch, therefore, the gargoyle, common in itself and mean in its application, is ennobled by a secondary use. It is a gutter—but it is more than a gutter, as an architect is more than a builder. It is fashioned into some shape that shall add another beauty to the fabric. Into some shape—yes—but what shape? Shall it be derived from the flora or the fauna that give their wealth of loveliness to the sculptor's work in wood or stone? There is no link of association between these and the purpose to be fulfilled. Shall men and women bend downwards with mouths agape to scatter streams of water on the incautious passer-by? Their places are within the church. Shall the angels be made to fulfil this gentle office? Rather let them, with outstretched wings, bear up the fretted roof of the choir, looking down with mild eyes on the worshippers. But the fiends, the fiends that come with the night winds, bringing with them the fury of the storm. The fiends that lurk in the miasma of foul air. The fiends that clamour at the painted casements, which they cannot break, because the sword of Michael, with which he drove them out of heaven, flames there. The fiends that rock the great steeple to its base, if only they may shake down the cross uplifted high in air. The fiends that beat despairingly against the massive doors, strong with a strength beyond that of oak or iron. Transmute them into stone! Let them grin downwards on the happy throng which crowds the threshold they can never enter.

New here is a strange thing. The very end and aim for which our cathedral is built is to make war against the Wicked One and all his hosts. And yet, just at the critical moment, when the architect is at a loss to deal with an essential part of his design—lo! of all things in heaven and earth and hell—it is the “fiends” who come to the rescue. And why not?—if my third proposition be true, viz. that in art, as well as in science, nothing is to be regarded as common or unclean if only it be in its right place. Whether a gutter is in itself a thing of beauty depends upon the point from which it is viewed. Is the hippopotamus a thing of beauty? As he lolls against the prison bars of his house at the Zoological Gardens, with rolling eyes and huge mouth opened wide for sweetmeats, it must be admitted that his shape is not elegant, and that his countenance is not attractive. But in his right place it is a very different matter. On the broad shores of the Nile, when the landscape is shimmering under the blaze of a tropical sun, when, as far as the eye can reach, there is nothing but the burning stillness of the vast solitude of vegetation without life—see! that mighty rush, as leviathan passes to the water. See! the white foam lashed to the skies, and through it the purple and gold of his harness, iridescent with light, startled from its sleep upon the river. The sea-horse is himself again. Offer him a biscuit now!

It is thus that art deals with sanitation. The gargoyle, if placed upon a pedestal in a drawing-room, would not add a grace to the apartment. But in its right place—high up, that is, upon the cathedral roof, casting its deep shadows from the meridian sun, or touched by the silver of the moonlight—there it is as beautiful to the idealist as it is useful to the utilitarian.

But the gargoyle serves another purpose. It serves to transfer our thoughts from architecture to sculpture. The gargoyle is essentially the design of the architect, but it brings the sculptor into the game, who, mounted on the high scaffolding, may still find work to do in the fretted roof or the crocketed spire. But the sculptor does not aspire to remain, like St. Simeon Stylites, always on so high a pinnacle. He would like, sometimes at least, to descend to the tympanum of an arched doorway, or the floriated capital of a column, or even to the pavement of the street, and show us what he can create in the shape of a lovely bas-relief, an acanthus scroll, or a statue. But if he attempts such a thing, what will become of his work? What has become of the few works of sculpture that are supposed to adorn London? Do they not look as if they had suffered martyrdom at the hands of the street gamins on the 5th of November? They are absolutely black with slime. Is that the best thing you can do with them? If they are to be treated as guys, why should they not be made as guys? That is my fourth proposition. The sculptor cries for help. Who will save him and his work from this degradation? Who will give him the hope of a future? We look to you. When you have cleared our great city of its tenebrous pall, and given us light; when you have cleansed our temple, we will decorate its shrine.

And then painting. What a glorious art it is in its noblest form—that of mural decoration. And yet no Englishman who has seen Tintoretto's designs in the Ducal Palace at Venice, or

Luini's great fresco in the church of the Angels at Lugano, or Raphael's decorations in the Loggia of the Vatican, can feel otherwise than that we are cut off absolutely from at least one phase of art, and that, as I have said, its noblest and grandest. But why? Again I say, it is not the climate that decimates our forces. It is the climate *plus* dirt.

What, then, is our hope for the future? Have we any hope for the future? My fifth proposition is that any great scheme for the development of national and historic art in England is hopeless so long as this state of things continues. This is a hard saying, but I will put it to the test by venturing to make a suggestion. I ask you to recollect the position that England has taken in the history of art. You know that there have been two great periods of art—the Classic, which gave us the Parthenon, and the Gothic, which gave us Westminster Abbey. You know that the mastery in these two schools, each perfect in itself, and neither second to the other, belong to the people of Greece and to the people of England. The race of men who built our cathedrals are the equals of the race of men who built the Acropolis of Athens. We then, as Englishmen, have a past to look back upon, and ought to have a hope for the future. We are a nation with high aspirations, ready and strong to do great deeds which shall be worth recording. And we have painters capable of drawing pictures on a wall. Let the nation, through its representatives, choose the event, and the artists choose from among themselves the man who shall paint it. One picture every year—of the chief event of the year, or the most noble deed done, or the highest good achieved. In the choice of subjects there should be no boastfulness of petty princes blazoning their puny exploits. Nothing should be recorded that had not stirred the heart of the people. In the choice of painters there should be no voluntary display of raw ambition, or fashionable frivolity or senile declension. They should be chosen by the suffrages of their fellow-painters in their prime, so that their work would become in itself a true historic record, not only of the executive power, but of the collective judgment of each living school of art as it arose, flourished and passed away. There is no genius of which the nation is proud that would be waste material or might not take its share in the enterprise. The pencil of Leighton would not be too refined, nor that of Watts too serious, nor that of Millais too robust. Landscape, the glory of English art, would find its place. Even the sculptor need not stand aside, for the sequence of glowing canvases might be varied by a group or a bas-relief in bronze or marble. The subject selected and the name of the artist chosen might be announced annually with the opening of the exhibitions of the year, and the artist should be allowed one year in which to complete his study or cartoon of the picture. Then his cartoon should be exhibited to bear the criticisms of the people. Few errors of historical importance would escape such an ordeal. Finally, the work should be completed by the artist, under no control save the influence those criticisms may have wrought upon his mind. There would be no risk of failure in such an enterprise. The events will come; the nation may be trusted for that. The men will come; some are with us even now, ready to begin the work. This would, indeed, be historic art, the marriage of art with history. And think what would be the issue in ten years, in fifty years, in a century. We look with wistful eyes into the future and picture to ourselves what we should see under such a scheme as this. Unless the future altogether belie the past we should see such scenes as these.

The hospital at Scutari—the sick and wounded of our soldiers on their pain-stricken beds—and then—

Lo! in this house of misery
A lady with a lamp we see
Pass through the glimmering gloom,
And flit from room to room.
And slow, as in a dream of bliss,
The speechless sufferer turns to kiss
Her shadow as it falls
Upon the darkening walls.

It is “Santa Filomena.” It is Florence Nightingale herself, not an imaginary suggestion of what she might have been, painted a hundred years after we had lost her, but she herself—

As if a door in heaven should be
Opened and then closed suddenly.

And then we see the interior of a classroom in London, with a few grave men and thoughtful women, and the pale faces of many children—large-eyed, wondering children—who shall grow up to see themselves in this picture, and to know that they were painted there because the opening of the first Board school was a revolution, mightier in its results and more far-reaching than any that has yet been chronicled in England. And then we see the senate-house at Cambridge and the first girl-graduate receiving her degree that shall acknowledge her to be as wise as Merlin, and leave her still as beautiful as Vivien.

We look for scenes like these because, although the past returns no more, yet the future shall be like it. Do we look for

them in vain? That is a question that can only be answered by the nation. Can be only answered by the nation, did I say? Ah, no. The nation cannot answer it, except through you. Who is there amongst you who will help to frame the answer? We wait for you. Dear as are the remembrances of the past, splendid as are these visions of the future, we can do nothing to realise them without you. Our frescoes peel from the walls, our paintings blacken in the foul gas, our mosaics corrode before our eyes, our statues trickle down with greasy slime. But when you have cleared our great city of its tenebrous pall and given us light—when you have cleansed our temple—we will not be slow to make its shrine beautiful.

That, Dr. Richardson, is what I, representing a society of artists, have to say to you, representing the Society of Arts. We long for your city of Hygeia. We know that science is working for us. The science of beauty greets the science of health. All that I have said of these three branches of the fine arts, architecture, sculpture and painting, in association with our national monuments, is true relatively of every subsidiary development of art. Science would cleanse the house and flood it with light. Art would cleanse the mind and fill it with beauty. And see how the two things, sweetness and light, which I call "the holy alliance," follow each other in natural sequence. Go into the dark little rooms of the labouring classes, and if it is not, indeed, too dark to see, observe the dreariness of the surroundings of our poor. They toil and spin, but they are by no means arrayed like Solomon in all his glory; they work like the bees, but they are not

Singing masons, building roofs of gold.

How can art penetrate to these dismal chambers? You know that in the old Mosaic dispensation it was forbidden to muzzle the ox that treadeth out the corn. Are we to be less careful for the labourers that contribute to our luxuries? How, I say, can we penetrate to their dwellings? We have our free galleries and museums, thank God, in almost all our great cities. But I want to get closer home than that; I want to lift the door-latch of the cottage and dreary flat, and the little parlour at the back of the shop; and I say, let sanitation lead the way, and art will follow. Give them light, and they will at least see the dirt and the nakedness of their walls. Give them light and cleanse their walls, and the cheap print will follow. And the print, though it may be cheap, need not be nasty. As it becomes cheaper, it will become better. And they will become better and happier with it; for with the sight of art will inevitably grow the love of art, and with love, happiness; and happiness is, perhaps, one of the most powerful disinfectants the world knows.

That is the reverse side of the shield. The main purpose I have had before me has been to show how much may be done by a Society of Arts for a Society of Artists. But there is another aspect of the question to which I wish to refer before I conclude. I mean the return that art can make. For, after all said and done, we may take it as certain that art is, and always must be, one of the environments of our lives that is daily shaping them to fair or foul issues.

Bad art, therefore, means much more than bad artists. It means dreary surroundings in our dwellings, ignoble buildings in our streets, evil thoughts in our hearts. But the miserable hoardings of our railway-stations, plastered with hideous posters that crush our eyes as with a weight, forbidding us to raise them from the mud upon the ground; the blank walls and ungainly furniture of our houses that make mud in our minds—these are not necessary evils. It is we who have made them, and cursed them with ugliness; they only return to us the curse, in mental depression, with its inevitable tale of physical suffering. If the artist is interested in the work of the sanitarian, the sanitarian should be equally interested in the work of the artist. I know that the erection of a fine edifice on the north side of Trafalgar Square, and the transfer of the Arch of Titus to the east end of the Strand, would not efface the calendar of crimes to be tried at the next assizes. But because art cannot do everything, it is unreasonable to conclude that it can do nothing. It can at least do this. It can so transfigure a little colour that lies inert upon the palette into a living presence that our hearts shall beat faster only to look upon it. It can so link thought with thought and put them into sweet words that we may look through Shakespeare's eyes upon an English garden of three hundred years ago, or hear the storm-shaken pines which make music in the Volkslied, or see the shadow that lay dark on Dante's life as lies the shadow of the cypresses upon his grave at Ravenna. It can so build stone on stone, and shape them into beauty, that the architects of the thirteenth century shall speak to us of the nineteenth, making us stronger for our duty and happier in performing it. For art stands alone in this, that it engages not some but every faculty of our being. Like the summer clouds that fill the sky, art sweeps across our world, drawing into itself all our aspirations, all our scientific attainments, every tender emotion of our hearts. How beautiful are these summer clouds! Now ranged in lines like the battle-

mented walls of a distant city; now massed together like an army with banners; now drifting through the azure in a myriad of ethereal shapes, like a company of angels looking down on us from heaven. How beautiful is art! in the splendour of its imagery, in its storms of passion, in its serene contemplation of things divine. But it is only art; but they are only clouds. Does science say they are only clouds? How then are the furrows made soft with the drops of rain? And art? Believe me, no tender thought or noble aspiration or high enterprise is lost to us because art fashions them into beautiful shapes. They come back to us as the rain comes from the clouds, and they make our lives fruitful in faith and wisdom and love. But the artist lives and works and dies, and his works perish with him. Why should they perish with him? That is the one question I press upon you. They need not perish with him. The time shall yet come when, if not the artist, at least his works shall be immortal.

EGYPTIAN ART.

IN his second lecture at University College Professor Flinders Petrie spoke upon Egyptian art from the sixth to the twelfth dynasty, in which he observed that after the grand school of the pyramid builders described in the previous lecture, the political and artistic power having somewhat decayed, the desert tribes pressed into the eastern side of Lower Egypt, and, seizing the capital, left the feebler art of the southern provinces isolated. No great works are known of this period of depression. The grand school of black granite was captured by the desert invaders, and we have one statue in this material of King Khian. It is only very lately that we have put his history together, and it is certain that he came shortly after the sixth dynasty. He is always called "Prince of the Desert" on his scarabs, but he adopted Egyptian titles on his sculpture. It is possible that this race worshipped guardian angels, and not greater deities, as he is said to be "beloved of his *ka*," or double. On the rise of the twelfth dynasty the Egyptians regained the Delta and the fine schools of sculpture, which had greatly deteriorated. Their best work is always formal, and, seeking to avoid heaviness, they fell into a shallow, slender and weak style, which further deteriorated into a peculiarly cold and harsh manner in the thirteenth and fourteenth dynasties. The Hyksos, a second invasion from the east of the Delta, broke in after this and secured the school of black granite, which, from its falling thus in the hands of invaders, lay probably in the Sinaitic Peninsula. The only parallel in all ancient types to this peculiar race is a people in North Syria, shown on the sculptures of Rameses II. Heavy as the race appears, there is yet no depreciation in the technical art during this period; and it seems as if a centre of civilisation had lasted at the granite quarries, which maintained its traditions, and was but little affected by the politics of Egypt. Meanwhile, the southern art had been studying good examples of the early times, and improving; and when the southerners again claimed the whole land in the eighteenth dynasty, their art blossomed with much purity and grace, which make up to some extent for the loss of pristine vigour and animation. There is no period after the fourth and fifth dynasties so worthy of admiration as Hatasu's. In minor work there was also spirit and life. A wooden statuette from Gurob may bear comparison with the celebrated wooden statue in the Ghizeh Museum. But the expression is infinitely different. The genial greatness of character in the statue of the old kingdom is replaced by a face belonging to a complex civilisation—calculating, hard, overbearing and heartless; the charming character and simplicity of early times has irrevocably disappeared.

TESSERÆ.

Titian and Rubens.

CRITICS are in the habit of confounding Titian with Rubens. No comparison can be more unjust to the Venetian. Rubens could not represent the woman life; he never touched it without defiling. His province was altogether different. What he could deal with successfully was the purely animal life, the rich and lavish life of the tropics more especially. The lustrous fur, the sleepy savageness, the stealthy grace, the infinite luxuriousness of the leopard cub and the river god are rendered with exquisite vivacity. It may be said that his most famous paintings are occupied with other subjects; but even of the Antwerp *Christ* the criticism holds good, for the peculiar effectiveness of that painting is derived from its curiously plain, homely and unaffected rendering of the mere animal body without life, which, as associated with a mystery which we cannot penetrate, has always retained over the imagination a certain morbid and unwholesome fascination. Now, Titian may not have the highest insight into the woman

life, but he has at least none of the essential vileness of the Dutchman. His *Flora*, his *Venus* in the Tribune, and his *Sacred and Profane Love* in the Borghese, are all copied from some captivating and bewitching ideal. In each we have the golden hair, the delicate life of the complexion, the fresh, meditative, voluptuous beauty. There may not be, perhaps, much of the soul, or of the higher heart and imagination, but still they are always redeemed from the grossness of Rubens by a certain abstract and indefinable refinement, by the subtle woman grace, if not by the divine woman purity. And this criticism may be very widely applied to all the maxims of the Venetian artist. Nothing can surpass his richness, fluency and brilliant imagination; but the moderation of his genius is quite as conspicuous as its versatility. The arrangement and ordering of the picture is always, as in the *Venetian Slave* of Tintoretto, Bonifazio's *Presentation of Moses*, and the *Rosario* of Titian, superb and sumptuous, as though the artist had been used to the regal ermine and the stately ceremonials of doges and kings; but, at the same time, there is none of the gilding and tinsel of the court lacquey, and the colouring, however lavish, is invariably chaste and harmonious. The drawing also, though neither sharp, hard nor coarse, is perfectly precise and distinct, exquisitely clear, delicate and transparent. Here Titian specially excels. He says what he has to say without any effort, but with a clear and joyous resoluteness, the fascination of which it is impossible to resist. There was neither weakness nor mistiness in his work.

English Sculpture in the Fourteenth Century.

Until the reign of Edward III. we can scarcely recognise an independent style of sculpture in England. The revolution in costume in that prince's reign produced a vast influence on art; the flowing draperies and beautiful arrangement of the dresses of females, with the fine chain-mail, which adapted itself to the movements of the figure, and was so favourable to the exhibition of natural forms, were then discarded. The light plate-armour introduced by the Italians, and adapted to German taste, together with the less graceful costume of females adopted at that period, checked the advancement of sculpture, and left little scope for the aspirations of genius. The good principles of taste were irremediably checked, and never again appeared in their original strength; at the same time, remarkable examples of science or skill in the mechanism of art were occasionally produced. The statue of the Black Prince in Canterbury Cathedral is a splendid memorial of the ability of the age, and it is as successful a work of its character, in metal, as could have been produced. This statue was gilt, and some of the accessories were tastefully enamelled. The statue of Edward III. in Westminster Abbey is a very dignified specimen of art, and, with the statue of Edward of Hatfield in the same church, is worthy to be placed in rank with the productions of the best period of English sculpture. The names of the artists who executed either of these works remain unknown. Amongst those employed in St. Stephen's Chapel mention is made of Michael, a sculptor, and of the following painters:—Master Walter, John de Sonnington, Roger de Winchester, and John de Carlisle. About the time of Henry VII. the prevalent character of sculpture was vigorous, and, although rude in execution, it was by no means deficient in feeling or expression. The effigies of bronze representing Richard II. and Anne of Bohemia, his consort, were fabricated A.D. 1395 by Nicholas Broker and Godfrey Prest, citizens and coppersmiths of London, who also provided the enamelled scutcheons and other decorative accessories. The fine altar tomb of Corfe marble was sculptured by Henry Yevele and Stephen Lote, masons of London.

Invention in Art.

The highest excellence is to effect the highest objects of the fine arts in the highest manner, *i.e.* by a direct appeal to the mind, as in the case of historical and poetical pictures, in which it is absolutely necessary that there should be some action going on; and the picture should explain itself as to what has gone before, what is actually being done, and give some indication of what is to follow. The physiognomy and costume should identify the scene and the period of the action; and to those acquainted with the history of that country the picture should need no description. But the action itself should be intelligible to all, whether acquainted with history or not; and the art and the artist should be entirely merged in the impression of the scene. But it should be observed that it is not necessary, in order to refine the feelings and to elevate the mind, that the subjects of the fine arts should be selected from celestial or terrestrial magnificence; that the heroes and heroines should be gods and goddesses, kings and princes, queens and princesses. There is as much real dignity in virtue in humble life as when encircled with splendour and rank, and a peasant doing a virtuous action is a subject of contemplation as well calculated to effect the legitimate objects of the fine arts as any achievement of the greatest monarch, surrounded by all the accessories of worldly pomp

and distinction. The second grade of invention is shown in those works of art in which the most elevating impression is produced or some emotion excited by an indirect appeal to the mind, in which the action is inefficiently represented, but the emotion, which would be excited by the action if intelligible, is produced by the general effect of the picture. Titian and Tintoretto afford some fine examples of this production of impressions by secondary means. In this class will also fall poetical landscapes, with or without figures, in which the emotion is excited by the character of the scene and the circumstances under which it is exhibited. As there are grades in the quality, so there are degrees of power in invention. Keeping in mind the test of value in the fine arts, a moderate degree of invention of a high quality must take precedence of a great degree of an inferior quality, unless the degree of the latter be so pre-eminent as to absorb all other considerations, as is the case in some of Rubens's and Rembrandt's pictures. The subject is terrific, perhaps a martyrdom; the circumstances attendant upon it are exhibited in their most revolting character; but the fearful truth and vigour with which every incident is presented is such that, while you draw your breath with horror, a reluctant admiration is extorted by the power displayed in producing so great an effect upon the mind with a few pigments. An instance may be found in Raphael's picture of the Morbeto, where an infant is attempting to suck the breast of its mother, who has died of the plague, the bystanders holding their noses. The incident of the child is revolting, but so natural as to compel an admiration of the painter's invention, notwithstanding the violation of taste. Not so the action of the bystanders, which, though perfectly natural, is disgusting, from its appeal to our sensual faculties, and in a manner calculated to do anything rather than excite agreeable or refined feelings. In these instances the ultimate object of the fine arts is effected in a very indirect manner. From the stupendous power displayed on an ill-selected, perhaps disgusting, subject, notwithstanding the coarseness of the images presented, the mind is insensibly led from the production to the producer by the vigour and truth with which the action is embodied, and to the contemplation of the extraordinary command of mind over matter. It is in the early stages of art that invention is generally found alone, as may be seen in the early Florentine and German schools, Etruscan sculpture, &c. The respective grade which such works are entitled to take will depend upon the intellectual impression aimed at and produced; the effect must always take precedence of the means. As the value of invention will depend upon the degree of taste associated with it, so the rank in which the skill in the art or means is to be placed will also depend upon the degree in which it is controlled or directed by taste.

The Romans in Yorkshire.

Inscribed monuments such as altars from the names of emperors in the inscriptions, prove Roman occupation in Yorkshire from the time of Domitian to that of Volusian and Gallus, thus corroborating the testimony of ancient writers. Of the dated monuments, the most curious is a pig of lead, inscribed with the name of Domitian in his seventh consulship, and found on Dacres Moor, in the centre of the county, close to an ancient lead mine. From the date of the inscription and the place of discovery, we may infer a fact of some importance—that the Romans, immediately after the reduction of the Brigantes by Agricola, commenced working the lead mines in the conquered territory. Besides their chronological value, the Roman inscriptions found in Yorkshire furnish us with much curious information relative to the legions, cohorts and *ala* of cavalry, and the places where they were quartered. Combining this information with the notices of troops in the *Notitia Imperii*, we find that the stations in Yorkshire were garrisoned by the 6th and 9th Legions, and by a variety of foreign cohorts, such as the Nervii and Lingones, whose history has been partially traced out by Horsley, but may be made much more complete by comparing the inscriptions found on the line of Roman wall, published in Hodgson's "Northumberland," and the "Tabulæ Honestæ Missionis," published by M. Arneth, of Vienna, which are copperplates containing the names of such soldiers as have obtained an honourable dismissal from the Roman service. One of these was found in Yorkshire, near Sheffield, and is published by Camden, but incorrectly, as has been recently ascertained by comparing it with the original plate. The inscribed monuments further furnish us with some curious particulars relative to the mythology of Roman Britain. Thus, the Romans, coming to a picturesque stream in Yorkshire, the Wharfe, appear to have deified it under the name of Verbeia; and in some instances, with that spirit of adaptation by which they were distinguished, they appear to have dedicated altars to the indigenous gods of the Britons. The uninscribed remains of Roman art found in Yorkshire afford rather negative than positive evidence of the social condition of that people. The absence of architectural remains of any consequence, excepting at York and Aldborough—the rarity of tessellated pavements, the debased and barbarous character of the scul

ture and ornaments—would, *à priori*, lead us to infer what we know from history, that the Brigantes were not conquered till some time after the subjugation of the south of Britain, and that their district, like the rest of the north of England, was held by the Romans only by a great and well-distributed military force, and not colonised by peaceful settlers, like the southern part of the province. A large portion of the Roman remains discovered in Yorkshire consist of enamelled fibulæ and other ornaments of a late period, which we may suppose to have formed the trappings of the Roman cavalry soldier. Among the most remarkable of such antiquities are those found at Stanwick, presented by Lord Prudhoe to the British Museum, and some discovered in Swale Dale, now in the York Museum. The Brigantes, or British population of Yorkshire, have left us traces of their existence in many parts of the county, but these remains have not been collected and examined with sufficient accuracy to enable us to ascertain the social condition of the race before and subsequently to the Roman conquest. Pursuing, however, the method of inquiry which has been laid down for the antiquities of Denmark, we may distinguish in Yorkshire, as in other parts of Celtic Europe, the antiquities of an age of stone, before the use of metals—the antiquities of an age of bronze, when that metal was in general use—and the antiquities of the subsequent period, when iron was substituted for bronze, and which corresponds with the establishment of the Saxons in this country. In the antiquities of the age of bronze we may discern the progress of Roman influence, distinguishing the work of the aborigines from that of the Romanised Briton.

French and German Painting.

The French paint man acting; the Germans, man thinking. French art is an art of action, because her people have acted; German, an art of thought, because her people have studied. French art is so signally popular in its character, that it might safely confide the favourable decision of its merits to the verdict of universal suffrage. German art, on the contrary, the product of study, appeals to the student and to the few; it needs a learned taste, to be understood; its walks are the secluded paths of meditation; it reaches the heart, not by the beaten road of the common understanding, but through the shadowy avenues of intuition and the mazes of the pure reason. French art is practical and actual, sharp and sparkling; German, dreamy, abstract and abstruse, and withal somewhat ponderous and pointless. The French paint a picture, the Germans think one out. The French paint events, the Germans poems. French art is physical, German metaphysical. The French make a figure speak through the action of the entire figure; the Germans concentrate the expression in the head, and make the face the mirror of the mind. The French take the world as they find it; the Germans refine, speculate and idealise, and hence their art is generic, typical and symbolic. French art lives in the busy world, German in solitude. Now, the best art has ever been philosophic. Leonardo da Vinci, from the marked purpose which runs through his sketches, was evidently building up an inductive art; and it is no less evident that his mind was fed and fertilised from the inner wells of a deductive philosophy. The same was true of Raphael, and is equally true of the modern Germans. German art is marked, however, by an excess of self-consciousness. There is a class of thoughtful people who are termed "absent," and in such characters German art abounds. The figures seem lost in reverie and abstraction; they are revelling in the mazes of imagination, or overpowered by the intensity of inwardly originating feeling; and thus absorbed they become, in fact, unconscious of the outer world.

Rock Tombs at Tlos, in Lycia.

Tlos is a most delightful place. Few ancient sites can vie with it. Built on the summit of a hill of great height, bounded by perpendicular precipices and deep ravines, commanding a view of the entire length of the valley of the Xanthus, the snow-capped Taurus in one distance, the sea in another, the whole mass of Cragus and its towering peaks and the citadel of Pinara in front, itself immediately overhung by the snowy summits of the Massicytus—a grander site for a great city could scarcely have been selected in all Lycia. Pinara has perhaps more majesty, but there is a softness combined with the grandeur of Tlos, giving it a charm which Pinara has not. The acropolis hill terminates on the north-east in perpendicular cliffs. These cliffs are honeycombed with rock tombs, some of which are of great beauty. The older tombs are similar to those at Telmessus; but there are others, of an apparently later period, having their chambers excavated in the rock, but with their doorways regularly built. Such tombs have often long Greek inscriptions. The oldest tomb, to all appearance, at Tlos is the largest and most interesting. It is a temple tomb, fronted by a pediment, borne on columns of peculiar form and Egyptian aspect, having no carved capitals and being wider at the base than at the upper part. From such columns the Ionic

might have originated, for we can hardly suppose this, apparently the most ancient and important tomb in Tlos, to have been left unfinished. Within the portico is a handsome carved door, or rather imitation door, with knocker and lock, on each side of which are windows opening into large tombs. On one side of the portico is carved a figure, which we may recognise as Bellerophon, mounted on Pegasus, and galloping up a rocky hill, which may represent Mount Cragus, to encounter an enormous leopard sculptured over one of the tomb entrances on the right side of the door. This animal may be a form of chimæra, but presents none of the mythological attributes, and is in all probability the representation of a "caplan," the leopard which infests the crags of Cragus at the present day. An ornamental flourish appears on the door side near the leopard, and is repeated on the corresponding panel on the other side, but there is no animal carved on that panel. On the panels beneath the tomb are carved dogs, and there are also traces of others on the pediment. Pegasus is a Persian horse having a topknot and knotted tail. A saddle-cloth of ornamental character has been painted on his back. The group of figures appears to have been originally painted. The head-dress of Bellerophon is very peculiar, as also the arrangement of the beard. The eye is rather full, and Greek. There is no inscription on the tomb. A few feet from it, on a level with the pediment, is a Lycian inscription in a panel on the rock, the characters of which are much larger than any met with elsewhere. Two other Lycian inscriptions occurred at Tlos, one on a tomb on the opposite hill, and another on one near the base of the acropolis hill. None of these had been previously noticed. In a field at some distance is a quadrangular pedestal, or perhaps top of a tomb, on one side of which is a representation of Tlos itself during a siege. In this curious view can be recognised the disposition of the walls on the acropolis and of the more remarkable tombs as they are still to be seen.

The Fleet Street Conduit.

Upon it, says Stow, was a fair tower of stone, garnished with the image of St. Christopher on the top, and angels round about lower down, with sweetly sounding bells before them, whereupon, by an engine placed in the tower, they, divers hours of the day and night, with hammers chimed such an hymn as was appointed. This conduit was rebuilt with a larger cistern at the expense of the City in 1589. In the triumphal progress of Queen Anne Boleyn through the City of London on her way to Westminster to be crowned, pageants, as they were called, of various kinds were set up at all the conduits in her way, of which the principal were in Cornhill, Cheapside and the one opposite to Shoe Lane, in Fleet Street; all of these were newly gilt and adorned for the occasion, and those at Cheapside and Cornhill were made to run with wine instead of water. At the Cornhill conduit, Stow informs us that a poet sat to recite a new ballad in her praise as she passed. The conduit in Fleet Street, we learn from the same authority, was newly painted, and all the angels had their faces washed, and were made to look decent and becoming on the august occasion. Upon the conduit was a tower with four turrets, and in each turret stood a child representing a cardinal virtue.

The Destruction of the Mausoleum, Halicarnassus.

A detailed account of the destruction of the mausoleum by the Knights of Rhodes is given by Claude Guichard, in his work on the "Funérailles et Manières diverses d'ensevelir," printed at Lyons, 1581, lib. iii. 5, p. 379. In that most curious narrative it is stated that in 1522, when the Sultan was preparing to besiege Rhodes, the Grand Master sent some of the knights to repair the castle of St. Peter at Halicarnassus. Looking about for materials the knights found in the middle of a level near the port some steps of white marble. Making use of these in their repairs, and finding the stone good, they continued to excavate on this site. As they dug deeper they found the base of the building enlarge, and at the end of four or five days' excavation they came to an opening like the mouth of a cave, entering which they arrived at a great square room surrounded with columns of marble, with their bases, capitals, architraves, friezes and cornices carved in half relief, representing combats and histories. The knights were at first struck with admiration at the beauty of this work, but shortly after broke and destroyed the whole of it, using it as materials. Besides this hall, they found a door leading into another, as it were the ante-chamber, where was a sepulchre of white marble of marvellous beauty and brilliancy, which they had not time to examine, the trumpets having already sounded the retreat. On returning to the spot next day they found the tomb opened and rifled, and quantities of fragments of cloth and gold strewn about, probably the work of pirates in the night. "Thus," says Guichard, "this superb sepulchre, one of the seven wonders of the world, after having lasted 2,247 years, was discovered and destroyed by the Knights of Rhodes to repair the castle of St. Peter."

NOTES AND COMMENTS.

THE latest requirements of the Education Department with regard to all schools receiving aid from the Exchequer ought to have been enforced some years ago, and it is to be hoped no excuses on the part of managers and others will be tolerated. What is called the voluntary system may have its advantages, but it is cruel, in order to uphold it, to make martyrs of little children (who are incapable to understand what it means) by immuring them in unhealthy schools. If people cannot with State aid erect buildings that will at least be equal to Board schools in sanitary conditions, they should not be allowed to entice children. The new circular of the Education Department unfortunately allows some latitude to managers, for it says that the inspector need not press for immediate alteration in every case, and the words are sure to be taken as an excuse for a do-nothing policy. Money should be withheld for every shortcoming in the buildings. It is no excuse to say that the majority of voluntary schools were erected several years ago; with as much justice the managers might plead for a continuance of obsolete methods of education. When it is remembered that children have to pass several hours in uncomfortable positions, the playground of a quarter of an acre for every 250 children is not an excessive requirement. Classrooms which are less than 18 feet by 15 feet are unsuitable, and it is desirable that brick walls should not be less than 14 inches thick. Adequate ventilation and heating are also required as aids to teaching. There is no doubt that the realising of the conditions of the last circular will be a costly proceeding, but as the schools were upheld without aid from the State, the managers would not be in a worse condition if all the grants were expended on the buildings. In many cases it will be necessary to erect new buildings, but as voluntary schools are sources of satisfaction to the opulent representative of various causes, it may not be difficult to find the money that will be needed. If it be necessary to have zealous supporters among the poorer classes, care ought to be taken to make them healthy. The latest demand is therefore a kindness to the upholders of voluntarism, although it may at first appear oppressive. It is to be regretted the Education Act cannot become as stringent in respect of private schools and other educational establishments.

COUNTY Councils that propose to become their own builders would do well to study the last report on the Government buildings by the supervising architect of the Treasury of the United States. In it the proposed cost of all buildings under way is given, as also the amount expended during the year. If dividing the whole cost of all of these buildings by the whole amount expended during the year indicates the average time required to erect a building for the use of the Government, it would appear, says the *North Western Architect*, that the steady employment of about three journeymen and three helpers on the average building would carry the work along at the rate required to complete within this average time. As a full force of superintendents and inspectors must be kept in any case, everybody can see where one of the items that unite to make Government buildings so very costly comes in. If Congress were to refuse to order another building until those now under way are finished, and then work on the plan of ordering more only as the money is set aside for completing them, there would undoubtedly be a great gain in economy of building. It may be replied that in England it is not necessary to employ a regiment of superintendents, as the workmen will become so proud of their privilege to take part in public works they can be left to themselves in safety.

THE French sculptor known as "JACQUES FRANCE" has been fortunate in escaping from punishment which he deserved. His bust of the Republic was supposed to be so typical it was adopted by the Government, to be set up in all the communes. M. LECREUX (for that is his right name) arranged for the reproduction of his bust with a M. LESERTISSEUX. Probably he forgot the transaction or fancied he had set aside the contract, for he made another arrangement with a M. PARROT. Unlike the two kings of

Brentford with their one rose, the two traders were not satisfied with their position, and all the parties became engaged in a lawsuit. The sculptor maintained that the first agreement was null and void, and that he had full liberty to enter into an engagement with M. PARROT for the sale of the right to reproduce the bust. The case came before the Tribunal de Commerce, and M. BINOT DE VILLIERS, an expert, was appointed arbitrator. After vain endeavours to persuade the parties to settle the dispute, the arbitrator decided that the original agreement with M. LESERTISSEUX was still valid, and could not be abandoned. The decision was considered by the sculptor to be tantamount to a doubt of his honour, and that he was supposed to be acting dishonestly. The arbitrator assured him there was no thought of criminality. The sculptor was not to be appeased, and, allowing his passion to rule him, he attacked M. BINOT DE VILLIERS, and with one of his tools inflicted several wounds. When M. JACQUES was brought to the police-court he declared that he was not guilty of a mere assault, as he wished to kill his victim. The trial, therefore, took place in the Cour d'Assises. There the sculptor pleaded that he had no intention to commit homicide, that the expert had annoyed him by his manner, and had even raised his arm to strike—all of which were denied by the sufferer. A doctor was ordered to report on the condition of the accused, and he found that the sculptor's mind was weakened by continuous excitement, and that his legal responsibility was diminished. As a consequence, the defendant was acquitted. In France there is not much sacredness about any office at present, but fifty years ago, if a litigant attacked a judge, he would not have been let off so easily.

OWNERS of dilapidated property will not hear with satisfaction of a decision given by Sheriff ERSKINE MURRAY. There is no reason why it should not be acted on in England. The case which gave rise to it was very simple, but very sad. In the outskirts of Glasgow are some dilapidated cottages which, in spite of their age, are not picturesque. Three days after Christmas a sweep was employed by the tenant of one of them. From the character of the chimney he was compelled to reverse the common order and work from above. The chimney gave way, and he was thrown to the ground, a distance of about 20 feet, and so grievously injured that in a short time he died in the hospital. The widow brought an action against the owners of the property, and was awarded 200*l.* with costs. An effort was made by the defendants—for landlords of their class are not scrupulous—to annul the action because the sweep was not licensed. As he was only a year without a license, the plea did not count. The Sheriff said that the owners of buildings are not to wait until their tenants report defects; it is their duty to have their property periodically inspected, and more especially when it is ancient. Contributory negligence was not admitted, and accordingly the defendants must pay 200*l.*, which probably is more than the value of the house.

NORTHERN caution has raised an obstacle to the final settlement of the claims between the Edinburgh Corporation and the North British Railway Company. It will be remembered that, after an arbitration, it was arranged that the company were to pay 25,000*l.* for those parts of the Princes' Street Gardens which are needed for an enlargement of the Waverley Station. The money was lodged in a bank, but although the time has expired which was fixed in the award, the Corporation remain unpaid. The reason is that the parties cannot agree about the form of conveyance. Supposing the owners and occupiers of the buildings facing the gardens take actions for the loss of a pleasing prospect, who will be responsible for the damages? The Corporation naturally wish to be secured against having to appear as the defendants in any future actions, but the railway company are as little anxious for that position. Both sides maintain they have a right to be exonerated against all claims for compensation by the owners of houses in Princes' Street. The Courts may be able to settle the difficulty which delays the commencement of the operations.

52 CADOGAN SQUARE.

THE improvement of Lord CADOGAN's estate has given opportunities to several architects to depart from the established type of West End house. Cadogan Square is one portion of the estate where a comparison between many designs can be made. We give to-day a house by Messrs. ERNEST GEORGE & PETO, and the illustration will suggest that their buildings are as effective and attractive in the solid as they appear in the picturesque drawings in which they were first revealed.

THE CHATEAU OF PIERREFONDS.

THE illustration shows another part of the court, including the chapel, which is situated nearly at right angles to the part lately given.

PREMIATED DESIGN FOR AN UNIVERSITY EXTENSION COLLEGE.

THIS design was prepared as a pattern plan upon which, subject to the modifications suggested and the requirements needed by any flourishing university extension centre, further and more specific plans might be based. The following data were assumed:—That (1) an average flourishing centre would need accommodation for 200 students in one large hall, irrespective of the other classrooms. That (2) the centre, even if flourishing, would be impecunious, and all architectonic effect would have to be got inexpensively. That (3) the centre might reasonably be situate in a well-to-do country town; and that therefore (4) the land procurable would have to be economised, and would probably be of the nature of ordinary street frontage, with a depth of say 50 or 60 feet. That (5) all planning should admit of the possibility of later expansion. The building as shown could be provided for a sum of 2,000*l.*, subject to the possibilities of the district as regards building material, stone, brick, &c., and exclusive of the internal fittings, for which another 500*l.* might be reckoned. It provides the following:—A hall, a vestibule, a secretary's office, men's and ladies' cloak-room and lavatory accommodation, a small lecture-room, a students' library, a large lecture-room, a laboratory and caretaker's apartments. In the style chosen it was the endeavour to express three things:—(1) Strict utility, as, for instance, in the square forms of the windows and the large light of the lecture-hall, &c.; (2) the idea of continuity from the universities, the architectural treatment being such as to carry out the idea of expansion expressed in actual stone in the buildings of Oxford and Cambridge, even as the extension movement is the social and literary expansion of the universities over the country; and (3) in the style indicated, namely, that fusion between the late Gothic and the Renaissance, though liberally treated for modern purposes and though the most strictly utilitarian, a reference to that earlier and greater extension of the universities when COLET lectured at Oxford and ERASMUS led the new learning of Europe from his little cell at Queen's. The design, which is by Mr. C. R. ASHBE, M.A., architect, 15 Lincoln's Inn Fields, London, was exhibited in the last exhibition of the Royal Academy.

LICHFIELD CATHEDRAL.

PRIOR to the dedication of the new window in the north transept of Lichfield Cathedral on January 25, Mr. J. Oldrid Scott read the following communication to the congregation:—

In order to make clear the reasons which have led the Chapter of Lichfield Cathedral to carry out the alterations in the window which is to-day to be dedicated, it is necessary for me to explain the steps by which the transepts have reached their present form. I need say nothing of the Norman transepts for the good reason that nothing is known of them. Whatever they were like they ceased to exist soon after the middle of the thirteenth century, when they were rebuilt in an exceedingly beautiful variety of the Early Pointed style, which had then reached its highest perfection. It is hard now, to a casual observer, to picture to himself what must have been the appearance of the transepts at this time, but by examining the indications which remain of the many missing features, and especially by comparing the corresponding parts of York Minster,

a very clear idea of their original beautiful design may be obtained. The changes which have taken place are mainly in the upper part of the building, as the arches leading into the aisles as well as those carrying the central tower have never been altered. The windows at first were all lancets, with the exception of the rose-window in the south transept, and whatever corresponded to it in the north. They were very richly moulded, and had beautifully-carved capitals of an unusual type; the coupled windows which still remain in the west wall of the south transept may be taken as a fair sample of what once prevailed throughout. They are wonderfully perfect in their proportions, and in the delicate beauty of their mouldings, while the capitals are carved with the greatest boldness and originality. Similar windows once existed in the corresponding part of the north transept, considerable traces of which can now be seen on the outside face of the walls. Above these lancets was a noble range of clerestory windows, disposed for the most part in groups of three of equal height to each bay. These can also be traced outside the building. A similar range occupied the east wall of both transepts.

All of these windows have left some indications inside, as their jambs in certain cases were retained. The groining was of wood, and rose to a considerably greater height than at present. The wooden groining at Lichfield is referred to in an order by Henry II., which directs his master-builder at Windsor to follow the groining of wood lately erected at Lichfield. The whole design of the transepts was based on what had been built somewhat earlier in the century at York Minster. There, there has been no material change, the early windows and the beautiful wooden groining remaining untouched, while the rich rose window in the gable of the south transept, which here has been hidden by the later groining, there forms a conspicuous feature in the design. I need not say that, while taking the transept at York as their model, the builders at Lichfield adopted a far smaller scale and simplified the design in many respects. Those of you who have ever ascended the spiral staircase in the south transept must be familiar with the finely-moulded wheel window, with its singular tracery and flanking arches, which occupies the whole of the gable and is now inside the roof. In old days it was certainly seen from below, above the series of stately lancets which then stood where the large tracery window now does.

The architectural effect of the early transepts must have been noble in the extreme, and one cannot help regretting that the builders of a later period should have obliterated so much that was beautiful. The great change which produced the present aspect of the transepts took place some time in the fifteenth century, and it seems probable that the chief object the builders had in view was, by substituting stone for the old wood groining, to make the cathedral more secure against fire, and it is very probable that it saved the cathedral from more complete destruction during the sieges in the seventeenth century. In order to vault the transepts with stone it was necessary to alter the form of all the upper range of windows. The wooden groining to which they were adapted must have been of the peculiar kind one sees at York, a large part of it being of the nature of a barrel-vault springing from a horizontal cornice above the clerestory windows. These windows were arranged, as I have already said, in groups of threes, of equal height, and as this was incompatible with the side arches or wall-ribs of stone groining, the lancets were taken down, and the windows which we now see substituted for them, one wide opening taking the place of each triplet. In doing this the jambs of the outer lancets were usually preserved, and the old archstones were reused to the new form, so that we find all through the transepts Perpendicular window arches with Early English mouldings. Great skill was shown in this work of transformation, and the groining introduced is of especially fine design; it is very bold, the bosses being unusually large, and the ribs finely moulded. The treatment of the side windows also was very successfully carried out.

At this point, however, it is necessary to stay one's admiration, for in dealing with the great groups of lancets towards the north and south, the artist's hand seems to have lost its cunning, and though the same system of reconstruction was followed which had produced such a good result in the side windows, the effect was by no means so satisfactory when the wider spaces had to be dealt with. The outer jambs were again retained and the old arch stones reused, but the height available from the top of the jambs to the point of the new vaulting was so small, while the width to be spanned was so great, that an arch of extremely low proportions resulted. The problem was somewhat better dealt with in the south transept than in the north, where the arch was of a most uncouth and irregular shape. Its redeeming feature was the beautifully-moulded Early English stones of which it was built, and probably its tracery was at first very much finer than as it came down to us, while it was without doubt filled with the noble stained-glass which belonged to the fifteenth century. It has always been said that the tracery was destroyed during the sieges and renewed by Bishop Hacket, but it would seem

that he did but very little to those two windows, for the bill paid by him for what is called "making them up" has lately been found, and the sum charged for them together is only 5/. After allowing for the difference in the value of money the sum is still so very moderate that comparatively little reparation could have been required.

I have described the architectural faults in the two large windows, and especially in the northern one, but there was also a far more serious structural defect. A flat arch is always extremely weak from being liable to sink in the middle and to spread outwards on each side. This subsidence is what had taken place to a serious extent in the north transept and to a lesser degree in the south. The ancient gable remained over the north window till near the end of the last century. It was of the full thickness of the wall below, and its great weight had crushed the flat window arch by a downward and outward pressure, doing much injury to the tracery and thrusting the side walls outward. We find that efforts were made at different times to stop this mischief by means at first of an iron tie bar alone, and in 1797 by rebuilding the gable at half its original thickness, making it rest on what is called a relieving arch, tied across by a second iron bar. The bill for this work has lately been discovered. In the south transept the tendency of the side walls to spread was checked by building the huge buttresses which so much disfigure this part of the cathedral. This was done by the celebrated James Wyatt. Thus we see that the stability of the structure was much reduced by substituting the two great windows for the lancets which preceded them, for I need hardly point out that a series of lancets divided by strong piers of masonry is infinitely more substantial than wide windows, with all the essential weakness which they involve. This, then, brings me to the actual object of my addressing you to-day.

The failure of the north transept window, though no doubt stopped for a time by the measures taken at the end of the last century, was by no means cured; the relieving arch had in its turn given way, and the gable above was dangerously cracked, the spreading of the side walls was still going on, and the tracery of the window was ready to fall out any moment. It was, therefore, absolutely necessary to take some active measures for putting a stop to the mischief which had been in progress for so many years, and for making this part of the cathedral permanently sound. Every attempt which had already been made to counteract the spreading of the wide arch had failed, because the arch itself had been retained, and it became a serious question whether it would not be the wisest plan to cure the evil, once for all, by removing its cause. An architect in considering a matter of this nature has to look at it from more than one point of view. An antiquary is right in looking solely to the maintenance of the building exactly as it has come down to us, with every evidence of the changes it has passed through intact, and happily, in the great majority of instances, these are also the lines on which an architect can act; but there are cases, such as the present, where he is at the same time bound to consider the appearance, and still more the stability, of a building, no less than its architectural history. Here, in dealing with the north transept window, there was, first, the absolute necessity of stopping the settlements in progress, then the fact that this window was an exceedingly unsightly one, both within and without, and finally the most interesting antiquarian fact, which in my opinion infinitely surpasses the historical value which the old window had, that the lovely design of the ancient lancets could be recovered with absolute certainty, and that in a great measure they could be rebuilt, stone for stone, out of their original materials. Had this window been the only one altered in the fifteenth century, and subsequently restored by Bishop Hacket, its removal would have been a very serious loss; but it is only one out of a considerable number; about fifteen others were so altered, and nearly forty were restored, the whole of which will remain as witnesses of the changes which have passed over this part of the cathedral. They are in good condition, needing nothing beyond ordinary repairs, so there is no reason why they should ever be interfered with. The exception is the great window in the opposite transept, but here, happily, the mischief is not very serious, and can, I fully hope, be dealt with by other means. The window itself is also far better looking than was the case in the north transept, and the tracery has not perished to anything like the same extent.

We claim, then, that in altering this window to the form in which you see it to-day, we have removed a dangerous weakness in the building which had been in progress ever since the tracery window was first introduced. We have removed a feature which was architecturally a serious blot on the beauty of the cathedral, and while doing this we have recovered a lost beauty as lovely as can be found anywhere, except indeed at York, where the noble Five Sisters, as they are always called, were doubtless the model on which they were originally designed. So far from obliterating the history of the building, we have surely made it far easier to decipher than it ever was before; for here in one transept is the window as the thirteenth-

century builders erected it, and there, in the other, is the window altered and adapted in the fifteenth, while everywhere around remain untouched innumerable traces of the restoring hand of the great Bishop Hacket.

I have only to add that the evidences we found for the design of the lancets were of the most complete and unmistakable kind, leaving nothing to be imagined by the architect, and requiring only patient and careful investigation. This has been bestowed on the work in ample measure by the excellent cathedral mason, Mr. Bridgeman, to whom, after the lamented donor more than to any one else, the credit is due for what has been done. In addition to the numerous ancient stones which were clearly visible in the great arch before the work began, others were found embedded in the walls in great numbers. They have all been used in the reconstruction, and it is satisfactory to know that out of the hundreds of stones forming the five beautiful arches above us, only twelve new ones were required. It is the earnest hope of those responsible for the work that if some sacrifice has had to be made, as well as some departure from the usual canons of strictly conservative restoration which guide us in our work here, it will be generally acknowledged that the gain has been far greater than the loss, and that the peculiar circumstances of the case have more than justified the steps which have been taken.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE fourth lecture of the new series was delivered by Mr. John James Burnet, A.R.I.B.A., the subject being "The Relation of the Architect to the Craftsman." After briefly referring to the question of the training of architects, and the recent discussion as to whether architecture was a profession or an art, the lecturer discussed the various points between architect and craftsman. In this connection it was noted that there were two classes of contractors; the one class who were craftsmen, and the other who merely employed craftsmen, and who, in the opinion of the lecturer, were on the decrease. The system of open tendering, while having its drawbacks, was not entirely an evil, the lecturer demurring to the reflection often passed on architects and clients that really good work was by this means often found to be underpaid. In conclusion, the question of machinery was touched upon, a general knowledge of which, so far as concerned the building trades, was considered by the lecturer as of importance to the architect. A discussion followed, and at the close a vote of thanks was awarded the lecturer.

CASTLE BROMWICH CHURCH

AT the last meeting of the Archaeological Section of the Birmingham and Midland Institute, Mr. C. E. Bateman read a paper upon Castle Bromwich Church. He acknowledged the assistance Mr. Cossins had rendered in the investigations, without which it would have been impossible to have arrived at so certain a conclusion as to the form and appearance of the earlier timber church, incorporated in the existing Renaissance structure, built at the cost of Sir John Bridgeman between the years 1726-31. The length of the present nave being divided into six bays, Mr. Bateman had discovered that the four easternmost comprised the extent of the former one, the present roof being carried by the east and west gable ends, still containing the upright exposed timbers and plaster, with seven intermediate trusses of most massive construction, and only 5 feet apart. The present three easternmost columns of plaster contain the oak posts which carried the ends of the principal trusses, the intermediate ones being carried on the head and cill pieces of the clerestory, which contains the original windows, timbering and plaster, now covered up with modern plastering. The clerestory indicated that there were aisles, and fragments of timber found in the roof, and used for ceiling joists and rafters, proved that they were timber also, and the appearance they had both inside and out. The roof of the chancel is modern, but the lecturer contended that the old chancel was of the present form, owing to the stone walls being found on the removal of the dado panelling, with plaster on some portions of the surface, and because churches of the eighteenth century were not usually built with chancels of so large proportions. That there was a rood over the opening into the chancel is almost a matter of certainty, owing to the large projecting moulding being worked on the inside face of the east gable, which would carry the crucifix and supporting figures, and also because the niche truss in front of it is raised higher than the others, which would be for the purpose of being better seen by the congregation. In one of the chancel windows is a fragment of painted-glass, the only piece now existing from the former church. A large amount of old timber was utilised in the construction of the floors in the

tower, and Mr. Bateman thought the bell-framing was the same that carried the old bells. In conclusion, Mr. Bateman referred to the old account-book, which contained many items for repairs to the old church, some of which were afterwards further explained by Mr. Hill, who showed the audience the pre-Reformation patent now used in the weekly celebrations, also paying a tribute to the architect who designed the rebuilding of the church, which is of such fine proportion and detail inside and out, when he was tied and hampered by the form and construction of the former timber building. Mr. Bateman illustrated his paper with numerous photographs of the existing church, measured drawings of the old structure, and views of the interior and exterior, showing its appearance before 1726, and was assisted by Mr. Harold Baker with his lantern. In moving the vote of thanks, Mr. Doubleday referred to the care that had been taken in the investigation and preparation of the drawings, and was supported by Mr. Churchill; also Mr. Hill, who referred at some length to the accounts, and Mr. Cossins, who said it had been a great pleasure to him to assist Mr. Bateman in his discoveries.

THE ORIGIN OF BUILDING.*

IN dealing with the subject which is to be considered this evening, I have thought it advisable to avoid the very dry studies or a technical student's lecture as far as I possibly could do so, and this will account to you for the omission in various places of numerous technical terms which you may notice as we proceed. Without further preface, therefore, I propose to give now a history of architecture and building, as far as possible, from its earliest conception and development and the various styles of architecture. It is generally accepted that architecture may be divided into five classes, viz. Prehistoric, Barbaric, Classic, Romantic and Revived Classic; these are again divided into twenty styles, and from some idea borrowed from any of these styles have been erected the buildings we see around us at the present day.

There is a marvellous difference between building and architecture and building, and I may state building was originated ages before architecture. Building was one of the first laws of nature—a covering, a habitation, was, after the Garden of Eden, a necessity for man, savage or civilised; therefore we find that from time immemorial huts or roofs to shelter human beings from the weather have been a necessity, even to the most ignorant of mankind. Some of these coverings used curiously enough very frequently to take the shape of an umbrella and a dome-like or circular form, and was composed of bent twigs covered with leaves, so that protection from the weather was the mother of architecture. This being the origin, we must trace it as far as possible in the short time we have through its progress towards perfection. Different occupations and conditions of mankind necessitated different sorts of dwellings and buildings; thus, it would be very ridiculous for we in England to build on the same lines as those in India or Africa, so architecture is sometimes defined as the art of building to the requirements of mankind. Building, as I have already explained, is older than architecture, it is older also than sculpture, but building combined with sculpture produced architecture, so that the architecture of a people (and with this I have been very much struck) is an important part of their history, or as one historian has it, "it is the external and enduring form of their public life, an idea of their state of knowledge and social progress." So to be understood properly we must consider architecture and building historically.

Again, ornament, I take it, is an essential part of architecture—without it there can be no true architecture, only building. I hope you will not misunderstand me here. I do not mean to say that a building should be erected for the sake of art and ornament, that would be a misconception; but it is essential that we keep clearly in mind throughout that there is a great difference between "architecture" and "building," and I have thought it my duty to thoroughly demonstrate this before plunging deeply into the work before us. To distinguish, therefore, architecture from building, we have from the earliest ages when man first began to think and beautify a gradual building up of those classes and styles of architecture to which I have referred and from which our buildings are designed. It is very well known, I think, that refinement (architecturally, at any rate) matured in the Eastern world ages before the Western. While the rude savages of the Western world huddled in caverns and holes in the earth, the Eastern races were erecting noble edifices. And by the word Eastern I do not mean simply Asia; but, crossing the Pacific Ocean, I refer also to Mexico, where, if it be possible to definitely place that much-debated and very slippery subject, "where architecture

or building really did originate," there is some reason to believe that it existed in Mexico even before it existed in Asia, but before arriving to this mankind must have passed over ages. "Every nation produced its own art or style by employing the various materials within its reach and by giving them such forms as their wants required."

The early peoples of this earth, starting say from Asia, could have but little idea of architecture or even of sound construction. They were wandering and pastoral tribes like the Hottentots, and lived in tents and wretched huts which had no pretensions to architecture. But my subject to-night is not the early history of our race (although it is closely allied), but the origin of building, its progress and development, so I must pass. About the oldest building with design about it that is known is the temple of Juggernaut in Southern India. The Brahmins attribute its foundation to the first king on the coast of Rissa, who lived, according to their chronology, 4,800 years ago. This, I am afraid, you must take with the proverbial "pinch of salt." Although it may or may not be so old as that, having doubtless been restored and partly rebuilt since it was founded, it is admitted to be exceptionally old, although not really completed until the eleventh century; and it is for this reason and of its being certainly of prehistoric origin that I give it here rather out of its place. I may have something to say as to this sort of building later on.

I have already referred to the first care of a people being to construct individual habitations composed of twigs and leaves, so the next step was to hollow out caves from the rock, or to pile stones one upon another and which were usually of a circular plan. Then came the erections for religious purposes, and the simplicity of these may be noticed in the construction of the altars of extreme early times. The first sacrifices the Bible and ancient tradition show were made upon consecrated piles of stones, which were collected upon high places. These altars, called "Bethel" (the house of God), were erected in Chaldea, in Judea and in Egypt. They were built (according to the Scriptures) of stones without cement, if the places where they were raised afforded the proper material. In other parts they were constructed of turf and earth, where the plain country around had no solid materials. Such erections or mounds are found in Asia Minor and in Judea. At Heliopolis, celebrated for the worship of the sun, a very great number of altars had been erected to various gods.

From the Eastern parts this simple manner of building, as applied to primitive altars and the sacred enclosures surrounding them (called the Phœnician prehistoric style), after having been developed in Asia and in North-Eastern Africa, extended into Europe from the borders of the Black Sea, and reached Gaul (or France) and also England, and are known by the name of Celtic or Druidical monuments, and a fair idea may be had of this construction from the scene of Stonehenge, showing the Druidical remains, no doubt originally used for religious purposes and enclosures. Numerous examples of this primitive construction are found in South America, supposed to have been erected long ages before Columbus or the Red Indian. We see a number of square pillars supporting enormous entablatures or architraves, the whole appearing to have constituted a large and well-constructed place (for the period). These evidences of the first attempts of past civilisation are fast disappearing, even where they still exist, as when the nations commenced to progress and improve they, very naturally, swept away the old primitive erections, just as we do in modern times, and using the material, where possible, for new constructions.

The system of construction which we have before us was gradually developed from its extreme primitive style to another form, very similar, but showing a step forward in the construction of the arch, combined with the piling of the stones. This leads us to the Pelasgic prehistoric style. This early system, noted for the rudeness of its form, its stability without mortar, and the great size and irregularity of its material, is attributed to the Pelasgians, a people originally from Upper Asia, who spread themselves over Phœnicia and Asia Minor and colonised Greece and Italy. This style of construction is also, very remarkably (and to this I will ask your special attention), found in different parts of America, principally in Mexico, taking the form somewhat of the pyramid, giving an idea that the early races of America had close connection or relation to the races of the East, as, even in this rough construction, the stones receded as they ascended for the purpose of stability, and forming the basis to which Eastern nations clung for ages in their construction, and the basis afterwards for the great Egyptian pyramids, which I hope to place before you shortly.

Perhaps the best example of Pelasgic prehistoric architecture that we have unearthed are the ruins of Mycenæ. In the upper half of the view we have an example of a horizontal arch formed by horizontal layers or covers of stone overlapping until they reach a point of contact. The lower part of the view is the Lions' Gate at Mycenæ. The gigantic remains of the Pelasgic monuments chiefly found in ancient Greece, when examined by travellers, bear traces of different modes of build-

* *The Origin of Building: Its Progress and Development. A Non-technical Review of the World's Architecture.* A lecture by Mr. Howell J. Williams, read at Anderson's Hotel on Thursday, February 2, before the members of the Olavian Society.

ing. Those which seem to be the most ancient are composed of large blocks of stone, or large pieces of rock, some being described by ancient writers as being so strong and of such large dimensions that a yoke of oxen could not shake the smallest of them, and this, remember, 3,600 years ago. It makes one wonder how they did it, and how we should be able to do it if our modern machinery and tools were taken from us and we had to do it without.

It is obviously exceedingly difficult to produce views of this extreme early stage, or to get accurately at the state of things in prehistoric times, and it will be readily understood that it has been very perplexing for the most learned writers to get at the absolute facts, but by some means or another we have been fortunate to have preserved to us a view of a group of Pelasgians, and I do not think it out of place to introduce these early originators of architecture, without prejudice (as the lawyers say) to the fact that the likenesses may not be strictly accurate, but a fair sample (I hope) of the race. These Pelasgic peoples, moving on from the Asiatic countries, one branch going further west (even, as some surmise, to Mexico, or possibly having come from Mexico and other parts of America), other tribes marching south and east, so that their influence is seen in India and Persia as well as Egypt, carried their methods of construction with them, for it cannot but be concluded that, without these original efforts in unhewn stone, these peoples would be unable to give to their ancient buildings the architectural effect which they did.

Turning from stone to wood, for the moment, one of the earliest accounts of building we have is that of Noah's Ark. There is a wonderful design about this construction, and I am sure you will agree with me that it should take its place in any history of early building and architecture. So we see on the screen a view of Noah building the Ark. I am not going to venture to say, however, to what branch or style of architecture it belongs. For an account of this notable construction I refer you to the Bible. I suppose, however, without joking, that Noah's Ark may be taken as the foundation of the system of naval architecture.

About the earliest record of a change in building from stone is found to have occurred in Chaldea (and here the professors have to go to the Bible for facts and truths that can be relied upon), for the want of stones in Mesopotamia, as a necessity (the mother of invention), taught the inhabitants to make bricks, and the first record we have of the use of bricks is in the construction of the Tower of Babel, which is the most ancient tower mentioned in the Bible. This building was an immense pyramid, built of bricks piled up tier upon tier. Up at the top of this place they used to sacrifice to Baal. At a later period the Chaldean kings used to place their statues there (when sculpture was allied with building). This pyramidal style seems to have held its influence for generations afterwards, even when these races had become very clever in the art of building, for the celebrated Hanging Gardens of Babylon (accounts of which one meets continually in research upon a work of this description), which were formed of numerous terraces one above another, had also this style, and even in the later Grecian buildings its influence is seen.

Before passing on to the next class, I will just name the four styles again that comprise the prehistoric class, and I have had specially prepared the view on the screen to illustrate them side by side, so that we may compare and take them in at a glance, as it was upon this foundation, so to speak, that the noble edifices of the world have been erected. The four prehistoric styles—Phœnician, Pelasgic, Celtic, Etruscan.

We now pass on to the next class, the barbaric, those ancient erections of durable materials showing a knowledge of systematic construction of which we have authentic record and present evidence in their ruins and specimens. The earliest records of the first city that contained durable edifices are found in the Bible, and without the Bible our knowledge of even historical facts would be exceedingly mean indeed. The first city that I refer to is Nineveh, the capital of the Assyrian Empire. A view of Nineveh is now before us. This ancient city is described by the old records as having been very large, even larger than Babylon. In Jonah iii. verse 3, it is described as an exceeding great city of three days' journey, the walls are said to have been 100 feet high, and so broad that three chariots might be driven on them abreast. Upon the walls stood 1,500 towers, each 200 feet in height. Nineveh, although thought by the Ninevites to be impregnable, was taken by the Medes 800 years B.C., when it was nearly destroyed, and again in 625 B.C., when it was totally destroyed. All that now remains of this once great city on each side of the river Tigris has the appearance of a range of hills, which are excavated from time to time, resulting in discoveries of statues and various pieces of sculpture. One really proved to be a statue of Cyrus, the Persian emperor; also fragments of buildings. But no doubt, owing to the great lapse of time, no connected building or part of a building has been brought to light at present. It may be of interest, as I have now the opportunity, to show a view of Jonah preaching to the Ninevites.

The next city, the name of which is familiar to us all, is Babylon. If you could turn to Genesis x. 10, you will find, referring to Nimrod, who is mentioned in the previous verse, "And the beginning of his kingdom was Babel," showing that Babylon was founded by Nimrod, the grandson of Ham, and became a city of very great magnificence. So great was the circuit of its walls that there was pasture and arable land sufficient to support the whole population during a long siege. In the walls were one hundred gates made of brass. The city was brought to its highest degree of perfection by Nebuchadnezzar, 600 B.C., but about sixty years after the death of that monarch, and during the reign of Belshazzar, it was besieged and taken by Cyrus; from that time it gradually decayed, and became afterwards a part of the great Persian monarchy. The ruins that have been discovered confirm the old accounts of its splendour, although nothing now remains except large masses of brickwork, with lime mortar still of good quality (no jerry work there). Among the ruins have been discovered fragments of alabaster vessels, pieces of sculptured marble and great quantities of glazed tiles, the colouring and glazing still fresh. Of what date these are it is of course impossible to know, but it has been proved that in the time of Semiramis, queen of Assyria 1665 B.C., an extensive and magnificent palace existed on each side of the river Euphrates, connected by a tunnel under the river. How wonderfully history repeats itself! When the Thames Tunnel was carried through by Brunel it was thought a wonderful thing, and possibly thought to be the first of its sort, as at this time these facts were not known. Babylon spread over each side of the river, like most of our modern great cities, and was also connected by a bridge. The piers were of large hewn stones, in order to erect which the course of the river was diverted, and its bed left dry. Of all the mighty buildings of the Babylonian empire we have only ruins, and the history of these is being dug up year by year. The various nations coming in contact with the Assyrians were naturally influenced in their architecture by them, and it is probable that Solomon, in building the Temple, was ruled by an Assyrian architect, the building being more or less of that Eastern style—a work of great magnificence.

I now pass on to the next style of the barbaric class, viz. Egyptian. At an early period the Egyptians were extremely skilful in working stone, an art in which they have never been surpassed. The large blocks of stones of which their temples are composed are well squared and so laid that the joints are scarcely visible, but so massively and solidly were their buildings constructed that some grand specimens remain to this day. Ancient Thebes, next to Athens and Rome the most important city of antiquity, was the capital of Egypt, and its most flourishing period was the age of the Pharaohs, 1200 B.C. This was really the first great building epoch in the East, as Nineveh and Babylon were then in their most flourishing condition also. We are told by travellers that Egyptian Thebes presents the most extraordinary group of ruins in the world; ruins of enormous size and covering a vast area. The ruins are mostly temples or temple palaces. A view on the screen shows an avenue at Karnac, one of the villages that now occupies a portion of the site of ancient Thebes, which is now buried deep in sand and earth, the specimens of buildings I show having been excavated and cleared of the sand. In order to form an idea of this portion of the gigantic buildings at Karnac (the Hall of Columns), we must imagine a hall 300 feet wide, in which are erected long rows of thickly-set columns, 150 of enormous dimensions, and in all probability erected 2,000 years B.C., i.e. 3,800 years ago.

We are almost constrained to admit that the ancient builders beat us completely; but it must also be admitted that the style of the Egyptian massive construction, though specially suited for the Egyptians, would not be suitable for modern times, when land is scarce and valuable and labour costs money. The hall is about one-seventh part of the whole edifice at Thebes; the heads of the columns are bud-shaped, and are also entirely covered with incised and painted hieroglyphics, producing a wonderful effect of barbaric splendour, and these paintings are mostly as fresh now as if painted but a few weeks ago. The height of the columns are from 40 to 60 feet, and the imperishable nature of the materials and the immensity of the masses has preserved the buildings for more than 3,000 years. At the present time the site of the ancient Thebes is occupied by four principal villages—Karnac and Luxor on the eastern side, and Gournal and Medinet-Abou on the western side of the river Nile, and the approach to Karnac from Luxor, a distance of a mile and a half, is lined with two rows of sphinxes.

The two principal characteristics of Egyptian architecture are grandeur and yet simplicity. Karnac claims to be one of the largest buildings in the world, and yet it is said to be one of the simplest. It had 100 gates, and the buildings and sculptures of this once gigantic city still existing are said to be the most ancient left in Egypt, and the most genuine and best specimens of Egyptian architecture and art; and there is every reason to believe that by far the greater part were executed before the Egyptians had experienced the influence of the

Greeks, and long before their invasion and being conquered by the Persians, 500 B.C. The principal remains of Egyptian architecture (chiefly temples) are to be found on the banks of the Nile, and extend from Cairo to Nubia, a distance of 500 miles. The entrance to the Rock Temple at Ipsamboul, in Nubia, is flanked on each side by two statues 68 feet high, carved out of the solid rock. Another temple is that of Edfou. This may be classed as restored Egyptian, not being of such extreme ancient date as Karnac, and yet flourishing centuries before Christ, and still in grand preservation. Our modern engineers are waking up to this question of durability, Sir John Fowler, the engineer of the Forth Bridge, probably the finest work of modern times, having said at the opening ceremony that he predicted that the bridge would last 1,000 years, and, if this be true, there is no reason why the Christian era should not yet erect structures to equal and even surpass the marvellous structures of ancient times. But of all the works of the ancient Egyptians, those that have caused the greatest wonder are the Pyramids at Gizeh. I have mentioned that from an early time the Egyptians were extremely skilful in working stone, and the view of the Great Pyramid gives some idea of their wonderful resources both in material and labour. It is 700 feet square at the base, and 407 in height. The Pyramids have been built in tiers or terraces, or blocks or steps one above the other, and the exterior cased in. The probable use to which they were put was a burial-place for the royal families and kings. About 300 paces from the Great Pyramid stands a gigantic statue of the great Sphinx, whose length from the fore part to the end has been found to be 125 feet. An explorer cleared away the sand and found a temple between its legs and another in one of its paws. Of the taste, style and character of Egyptian architecture little need be said beyond a word of admiration at the immensity of the works and the patience with which they must have been accomplished. Their monuments are admirable for grandeur and solidity, and have a most imposing effect, but the ornaments and sculpture represent a symbolic and barbaric religion of the Egyptians, and consequently admit of no rival except, as I have already said, in a question of durability.

I have now dealt with two out of the four barbaric styles, viz. Syrian and Egyptian, and the other two are of a certain similarity that I feel I need just mention. They are Indian and Mexican; Chinese is scarcely considered, though very peculiar. The cause is chiefly the wooden construction.

We now come to a class of architecture with which we shall deal mostly, and that is Classic. The four styles of architecture forming this class are Greek and Roman, or Pagan Classic, and Latin and Byzantine, or Christian Classic. We will take the Greek first. Greece was in very early times divided into a number of petty states, each independent of the others, and consequently rivals. As a means of protection they surrounded themselves with thick walls. Even before they learned to build temples and noble buildings the surrounding walls were called Acropolises, but scarcely any specimens of this extreme early Greek building are left. From these primitive constructions the Greeks progressed step by step into that glorious architecture and art that influences the world so much at the present day. Some of the oldest remains of ancient Greek construction exist at Mycenæ, near Argos, in the Morea. The date of the masonry is supposed to be coeval with the time of Abraham, 1917 B.C. The Greeks were only beginning these arts and constructions when the Ninevites and Babylonians were at the height of their civilisation, and it is most probable that these ancient Greeks received their first ideas from these Eastern parts, and by the study of Syrian and Egyptian architecture that I have just described. The walls of Mycenæ are mostly built in unhewn stone, each piece mostly from 8 to 9 feet in length, and when entire they must have been 60 feet high. The general thickness of the walls is from 21 to 25 feet. At Mycenæ there has been discovered a subterranean building which is known to have been the Treasury of Atreus, the father of Agamemnon. This chamber is cut out of the earth in the side of the hill, and then lined with stone, of a circular construction. This, again, was a step towards those stone buildings for which they became so famous. Before the time of Homer, 900 years B.C., there were few temples in Greece or Asia Minor, and the sacrifices were performed upon altars in the open air. These altars were in time surrounded by rude walls and enclosures without roofs. These gave way to architectural constructions with elaborate columns, as in the view of the temple at Paestum. After a time, as the forms of worship became more and more mysterious and (to the priests and people) more sacred, the ceremonies were concealed from the general public view by the temples being erected sufficiently lofty, and the still more sacred portions entirely concealed. The most ancient type of the Greek column, viz. the Doric, particularly in its commencement, is very like those of Egypt and Syria. If the capitals of the columns at Karnac were to be cut down, say, three-quarters, the remainder would be Greek Doric, and no doubt you see some resemblance in the columns in the view before us to the

columns at Karnac. The genius of the Greeks developed this first idea and enriched it with details that the Egyptians had neglected. The first principal characteristic of the Greek Doric is the nobleness and dignity of the whole order, the severe simplicity of its details and the moderate use of ornament. The columns have no base; the shaft is ornamented with wide yet shallow flutings. The name Doric came from Dorus, a king, the son of Helen, who built a temple of the Doric order, sacred to the goddess Juno, in the ancient city of Argos, near Mycenæ, 1,200 years B.C. Another example of the Doric order is the Parthenon, an example of highest beauty, according to connoisseurs of the architecture of Greece. The Parthenon is at Athens. This temple was dedicated to Minerva, and is supposed to have been completed in the administration of Pericles, about 460 B.C., and cost 1,000 talents, or about 100,000%, built of marble, eight columns at each end, one end seen in the view, and a long colonnade at each flank. The greatest glory of the Parthenon was the group of sculpture with which it was at one time crowned. From 600 to 400 B.C. was the most splendid period of the history of the Greeks. They had conquered all the neighbouring countries around, and their two principal styles of architecture, viz. the Doric (which we have just had) and the Ionic, each were influenced by certain conditions.

Ancient Athens stood midway between the western portion of the Greek states, where the Doric order was most favoured and flourished, and the eastern and Asia Minor states, where the Ionic order (of Oriental origin) was most used, and therefore was to a certain extent neutral ground, and favoured both styles. At Athens there was a high rock. There the early Greeks built those enclosing walls for protection to which I have alluded. Here they made their fortress, and it was here they found the high place for their altar. The massive walls would be a fortification and a protection against those rival states, and to which they could retire in case of need. This was of course before the city had grown to larger proportions. This place was called the Acropolis, and became the foundation for the future temples and notable buildings. Upon this Acropolis were erected (to show, I suppose, strict impartiality between the various states) two magnificent temples, the Parthenon, which we have just seen, and the Erechtheum, which we may take as an example of the Ionic order. The Erechtheum is a somewhat small building, at least compared with some of the massive buildings of Greece, and was built in the same century as the Parthenon, 400 B.C. Here we have one of the most beautiful specimens of the Ionic style of architecture. On the left of the building will be seen a small porch, the columns of which are human figures, caryatides, the most costly and elaborate form of support ever put into a structure. To make beautiful sculptured slaves and captives do the work of the columns and supports is an idea especially belonging to the Orientals and to antiquity. It is also perhaps worth mentioning that in the Doric male figures are used—massiveness and strength; while in the Ionic female figures—lightness, elegance and grace, an attribute belonging, I think, to the ladies.

Some time before the conquest of Greece by the Romans there came into use another style of architecture, called the Corinthian, which surpassed even the Ionic in delicacy of proportion and richness of decoration; but it was not used much in Greece previous to the Roman conquest, although it was afterwards under the fostering care of the Romans. There are some splendid specimens, such as the columns of the ruins of Baalbec. Greece became part of the Roman empire 146 B.C., except Athens and Delphi, which were declared as free towns. The Roman orders or styles of architecture were confined to the immediate neighbourhood of Rome, but are found in all parts of the Old World where the influence of Rome was felt. The Corinthian style was fostered by the Romans and encouraged by them everywhere. Their architecture, however, can scarcely be called original. It was borrowed from the Etruscans and Etruria (a province of Italy now called Tuscany), which was supposed to be a province of Greece, so that in two ways, by early settlement and by conquest, the Romans acquired their architecture from the Greeks. The Romans, of course, introduced new ideas and forms into their style of building, but the main origin is not their own original conception.

The Romans really commenced their building history 540 B.C. Art was really not properly understood by the Romans at the time of their conquest of Greece, and we find them quick to borrow or copy some of the beauties of Grecian architecture and combine them with their own. This is seen in the case of the Pantheon at Rome. The Romans were also in the habit (for some time after and perhaps before the conquest of Greece) of commissioning Greek architects to assist in designing their buildings, and drew upon Greece for the sculpture to adorn their villas and buildings. Thus the Pantheon shows an example of a mixture of styles, and could almost be taken for two separate buildings (one the main building and roof), a transformation of the old Italian burial mound (here it consists of a solid cylinder of masonry), and

set up in front of this is a Greek portico of light columns, in appearance like a Greek temple of the Corinthian order, with little harmony between the two styles. We see before us a grand dome with a porch, though not of the greatest beauty. It has the advantage of being the largest, as well as the first, piece of vaulting in the world. Its diameter is 140 feet, and was erected by Agrippa, 27 B.C.

(To be continued.)

MANCHESTER CATHEDRAL.

IN the *Manchester Guardian*, Mr. Reginald Blomfield offers the following criticism on the restoration of Manchester Cathedral:—

The work done in the last few years in Manchester Cathedral can hardly be considered an ordinary case of restoration. The horrors perpetrated in 1814-16, and again between 1845 and 1873, had reduced the fabric to such a wreck that in point of fact there appears to have been very little left to restore. Moreover, as it was necessary to transform the church into a building capable of accommodating a large congregation, it would clearly have been impossible, even if desirable, to reconstitute the church in the state in which it was left in the sixteenth century, for this would have involved the reconstruction of the chantries and their screens. The actual necessities of the case undoubtedly justified considerable interference with the fabric, and the rebuilding of work which had become ruinous. But admitting the necessity of restoration, or rather of reconstruction, the question which must have presented itself at the time, and still returns to the mind of the critical person, is whether or not the right method was adopted. There were two possible ways of dealing with the problem of restoration. Either the work which had to be rebuilt could follow the old work exactly, and to this course there is the objection given above, that new work cannot reproduce old work of this kind exactly, and that, even if it did, it would be simply to manufacture so much fictitious history; or the new work might make no attempt to follow the old, but be designed afresh. For reasons already given, the latter would, in my opinion, have been the right course; it would at least have prevented the building from being unreadable even to an architect, and would have been a substantial contribution to the history of the church. However, it was decided to follow the old work exactly, and Mr. Crowther, the architect, has evidently spared no pains to render his imitation as complete as possible. His attempt unfortunately was an attempt at the impossible, and of necessity his reproduction of the old details lacks the vitality which carries conviction. As to new work, perhaps the obligation which he imposed on himself to copy the old work almost with servility may have cramped his design, and may account for its wiriness in detail and deficiency in scale and proportion. For instance, on the north and south sides have been added two porches. In both these additions the stonework of the tracery is too small and overcrowded. The subordinate mullions are too thin (much thinner than any Mediæval builder would ever have dreamt of), and the cusping is purely mechanical. In the cinquefoil heads all the cusps are of the same size, whereas it is well known to students of Gothic that in the best examples the centre cusp is always larger than the other four—a point well brought out in the tracery of Mr. Bodley's beautiful church at Pendlebury. Again, the glazing is altogether out of scale with the stonework. Where ashlar is used the size of the stones establishes a certain scale which has to be followed all through. The panes to the glazing of all the new windows are not an eighth of the proper size in view of the scale of the stonework. The effect of these horrid little lozenges with rather wide came is neither more nor less than stuffy. The inscription over the south porch, with laudable modesty, is carved in letters so small as to be barely legible. Now, lettering was a decorative chance that no Mediæval designer ever threw away, and if he was going to have an inscription he would have no doubt employed the whole space now occupied by the quatre-foils, the brattishing, and the inscription with one great label of letters. The actual letters used should have been at least six times as big. The same absence of proportion appears in the west side of the north porch. Here the inscription string is placed in the wrong place. Either there should have been no string at all, or it should have been placed either higher or lower. Had this been done, a definite relation of high and low would have been established between the wall spaces above and below, which is the whole meaning of proportion. As it is, the building is long-waisted, owing to the position of this string. The north part of this porch is very much better, and is a good piece of modern Gothic. Here the proportions are justified by the wide plain opening below the string and the rich canopy-work above. But why was that niche on the east side put in when there might have been here a bit of plain wall surface, for which the soul of the weary pines in vain in Man-

chester Cathedral? One word more of criticism on the south front before we go inside. The two new windows inserted in place of the windows of 1815 are not happy. If these windows were to be replaced, why not have done an unmistakable piece of new design, the plainer the better, or else follow the segmental heads of the windows to right and left? Either adhere to the symmetrical design or frankly break it; as it is, these windows do neither.

Mr. Crowther, or his builder, appears to have overlooked the essential element of a four-centred arch—that it should be four-centred, and not struck from two centres with straight continuations. A comparison of the arches of the new four-centred windows with Stanley's genuine four-centred archway into the chapter-house will show how much is lost by neglect of this exceedingly simple practice of the Mediæval builders.

Inside the cathedral the restorer has hardened his heart. He has rebuilt the nave and aisle arcades doubtless in faithful copy of what may have been there before. Otherwise it would be hard to account for the altogether unworkmanlike way in which the mouldings of the piers come down anyhow on to the flat surface of the base. On the whole, the chief fault of the new detail of the interior is its inattention to scale. The crockets and carving above the two new entrances are unpleasantly crowded, and suggestive of branches of broccoli. The woodwork to the screens and doors is thin, and somewhat resembles the cast-iron tracery of the 1820 days—the days of darkness and despair. That it is possible to use very delicate tracery is proved by the old screens of the cathedral, and again by the new woodwork in Pendlebury Church. But it all depends on proportion. It does not do to have thin tracery straggling down thin mullions in sheer weakness and incapacity to stop; but if there is a definite relation between intricate and plain, open and solid, the delicacy of thin open-work is justified by contrast.

Mr. Crowther has been very much happier with his new roofs, which are well designed, and very materially add to the rich effect of the church as a whole. The nave roof is a little heavy perhaps, but on the whole will stand comparison with many a roof of the sixteenth century. On the south side of the choir a space has been walled off for the Fraser Chapel, and the south window of the next bay westward has been taken down and set back flush with the opening to the chapel. The reasons for this proceeding are very mysterious. The new wall on the west side of the chapel is ugly, and a fine opportunity for a wooden screen or a grille of iron or copper is lost by building it; while outside the sins of the architect have found him out, for though he skilfully added a buttress, he could not get over the fact that to the east of the south window of the chapel there is a broad space occupied by two tiers of cinquefoil panels, whereas on the west side all that could be allowed was a narrow return angle barely one quarter as wide, and the result is that as you stand opposite the chapel on the south side the composition is hopelessly lopsided.

In spite of these criticisms, however, the work done in the cathedral in 1882-92 is more thorough and conscientious than anything done since 1815. Not to dwell on the mutilations of the first half of this century, there is the new tower. The old tower, completed in 1518, was pulled down in 1863, apparently for no reason except that the north, south and south-west pinnacles of the tower were blown down in 1792 and the slate roof had been allowed to go to ruin, so that the flag-staff had decayed, and it was dangerous to ring the bells—dangers which might have been met, one would think, without pulling down this fine old tower. However, whether it was necessary or no to pull down the old tower, it certainly was not necessary to build in its place such a monument of sham Mediævalism as the new one. The old tower was 124 feet high, but he who designed the new tower thought he would "go one better," so he made his tower 139 feet high, but copied the old details, as if by dragging out the details like india-rubber the design might be made more imposing without losing its character. The consequence is that whereas the old tower was a compact and well-proportioned piece of architecture, the new tower is positively oppressive in its gaunt, unutterable lankiness. Then, again, Sir Gilbert Scott, the arch-destroyer of our national monuments, left his mark here also. Manchester Cathedral was once the happy possessor of an organ made by Father Smith in 1684, with a good oak case of about the same date, which was repaired in 1742; but Scott, with his villainous idea of "Gothicising" everything, swept this organ into space and spent some 5,000*l.* on a new organ and the trumpery case which now occupies the west end of the choir. Whether the organ is at all equal in tone to the old one it is impossible now to say, but it is clear to anyone that the new organ case clashes hopelessly with the fine old woodwork of the choir, and as seen from the nave its effect is fussy and insignificant. The last horror of all is a new alabaster pulpit. Now, alabaster ranks with marbles in the beauty of its veining and its colour, both of which can only be seen to advantage in flat plane surfaces, as may be seen on the south side of the stairs to this pulpit. But the pulpit itself is elaborately carved

from top to bottom, with the result that one cannot see the beauty of the marble because it is concealed by the carving, or make head or tail of the carving because it is concealed by the translucency of the marble. Moreover, the large cove above the capitals to the cymettes is not a stone or marble construction, but taken from the ordinary wood or plaster cove in front of wooden brackets.

Few churches have suffered more cruelly than Manchester Cathedral, and it is rather melancholy to think that not the least of the serious injuries it has suffered have been due to generous piety of excellent intention but inadequate taste. Though the interior of the church is effective in its way and not without some charm of colour and the mystery given by the vistas of its many aisles, the net impression left on the mind of a stranger is one of confusion, of a sense of bewilderment, due to the extreme tenuity and want of reticence in the details and the absence of one great masterful idea controlling the whole. The new church at Pendlebury (St. Augustine's) provides a good object-lesson in comparison. Nothing could be simpler than the idea of this design—one great aisle with shallow bays at the sides formed by the internal buttresses. Yet by austere reserve in ornament, by scholarly and refined proportions, and by a most delicate and fastidious taste in colour Mr. Bodley has succeeded in producing one of the most dignified and beautiful churches built in England since the time of the Reformation. There is, indeed, in the old cathedral one grand fragment of inestimable value. At the west end of the nave there remains the old tower arch and parts of the adjacent wall. The tracery of its panels is effaced, the contour of its mouldings is fading away in the slow decay of time, its entire surface is dented into a soft delicious texture. But it still stands strong, simple and masculine, scarred like some time-worn hero frowning contempt ineffable on the pettiness of later ages.

KIRKSTALL ABBEY.

THE members of the Sub-Corporate Property Committee of the Leeds Corporation having charge of the Abbey ruins and grounds at Kirkstall visited them on Monday. They were met by Mr. Micklethwaite, architect, under whose instructions the work of preserving the ruins has been steadily proceeding during the last few months. As has been previously stated, says the *Leeds Mercury*, the most dangerous part of the ruins is the tower, and it was to this particular portion that Mr. Micklethwaite directed the attention of the committee. Eventually the members passed a resolution recommending the Council to allow the erection of certain buttresses, and also the construction of an arch across the transept. These, it was said, would considerably add to the security of the tower. In the Abbey grounds the "unemployed" have been doing good work. They have almost completed the construction of a 36-foot carriage-road through the grounds. The soil dug out in this way has been formed into a bank, which runs along the edge of the water. Upon this trees will probably be planted.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE seventh general meeting of the Institute of Architects was held on Monday evening, Mr. J. Macvicar Anderson, president, in the chair.

Mr. ARTHUR CAWSTON then read a paper on

The Advantages of adopting a General Scheme in making Improvements to the London Streets.

Mr. Cawston said:—When we as architects remark the convenience and the spaciousness of well-ordered continental towns we cannot resist a feeling of admiration for their grandeur, and a just feeling of pride in our foreign professional brethren whose ability and labour have produced such splendid results. But if our *confrères* abroad are entitled to praise for the splendid works they have achieved, can we here in London claim any such praise for what we have done towards the improvement of our capital?

When last year our Government tardily attempted to remedy the block in the law business of the country they referred the question to a council of judges, who, as heads of the legal profession, were evidently considered responsible for the defects which caused the block. If an epidemic of typhoid fever breaks out in London through a contaminated water-supply, or if any other infectious disease ruins the health of our towns, surely medical officers of health must be held responsible, as they should have warned the authorities of the danger, and used their influence to prevent it.

In the same way with regard to architecture we cannot get away from the fact that any impartial observer must consider that we, more than any other body of Londoners, are responsible for the inadequate and inartistic streets of our capital. Of course we who are in the secret know (to our cost) that the

real reason why London has lagged behind in the march of improvement is to be found in the fact that we have had no real municipal government, and naturally no municipal enthusiasm. Unfortunately, however, this is not universally appreciated, and so we architects continue to suffer reproach for the absence of convenience and dignity in our streets.

However, we have now a popularly-elected governing body, and, as everyone anticipated, we are getting men of distinction to interest themselves in our wealthy and historic capital. All excuses for procrastination, therefore, are gone, and London ought now to become what her inhabitants desire, and what her architects, we flatter ourselves, are able to make her. For the main responsibility for the architectural appearance of our town cannot rest entirely with a body of gentlemen the majority of whom are or are not elected every few years, and who are always occupied with a thousand and one other weighty problems of daily government. Such responsibility should, in my opinion, rest largely with the organised representative body of the profession, one of whose most important functions should surely be to advise on the architectural improvement of London, and another to sit in judgment on the work that is carried out.

Let us then, encouraged by the happy constitution of our new popularly-elected government, and undaunted by many attempts that have from time to time been made and proved ineffectual, make one further attempt to prepare for such a reformation in the architectural appearance of our capital as will at any rate bring it up to the level which has been reached elsewhere.

It will probably occur to every one of my hearers that the best examples of city improvements are to be found abroad. But I want you to clearly understand that if equally good examples were to be found at home, I should prefer to study them. I give place to no man in my admiration of the artistic works of my brother architects of modern times, and I am proud to belong to a profession which includes the names of Sir Gilbert Scott, Sir Charles Barry, George Edmund Street and many others who are still among us. These names, however, are associated with isolated works, and for that architectural work which comprehends the regeneration of cities it is essential to look for examples abroad. This Institute realises this necessity in practice by sending some of its most promising students over the seas year by year. By this means we have reported to us the progress that takes place in all that pertains to architecture throughout the civilised world; and from this and other sources we find that the capitals of Europe have been or are being rapidly transformed into well-ordered, convenient cities. In carrying out the work some general principles, fixed and immutable in their nature, must have been adhered to, and if similar principles can be ascertained and applied to London, we shall without doubt be able to convince our councillors that our capital can yet be made to rank amongst the most convenient and beautiful as well as amongst the most wealthy capitals of the world.

Of recent contributions to this Institute on foreign cities which particularly refer to the subject before us, I need hardly remind you of that from our members, Messrs. Farrow and Blashill, who in 1889 gave us an interesting account of those splendid extensions which have already taken place in Vienna; or that in the same year Mr. Francis Hooper, as holder of the Godwin Bursary, studied in Paris, and delivered before this Institute a most valuable account of building control and administration in France. In his paper were enumerated the series of laws under which our industrious and thrifty neighbours have nearly completed the rebuilding and transformation of their capital. A vast transformation indeed, which has perhaps never been more powerfully described than by Mr. Albert Shaw, that most competent critic of municipal institutions, who writes as follows:—

In the work of transforming the labyrinthine tangle of narrow, dark and foul Mediæval alleys into broad modern thoroughfares, and of providing those appointments and conveniences that distinguish the well-ordered city of our day from the old-time cities, which had grown up formless and organless, by centuries of accretion, in this brilliant nineteenth-century task of reconstructing cities in their physical characters, dealing with them as organic entities, and endeavouring to give such form to the visible body as will best accommodate the expanding life within, Paris has been the unrivalled leader. Berlin and Vienna have accomplished magnificent results in city-making, and great British towns—Glasgow, Birmingham, Manchester and others—have in a less ambitious way wrought no less useful reforms, but Paris was the pioneer. French public authorities, architects and engineers, were the first to conceive effectually the ideas of symmetry and spaciousness, of order and convenience, of wholesomeness and cleanliness in urban arrangements.

The grandeur and masterful thoroughness of the work prove that Paris, as it exists at present is the modern model city London is probably destined to copy, as the increasing density of population makes it necessary to pile up many more human beings on a square mile, without impeding a constantly increasing circulation.

I suppose we shall all agree that for this reason, and because of the great strides in sanitary knowledge during recent years, it is essential that our metropolis should as far as possible be improved and adapted to the requirements of to-day. The principal reasons for such improvements may be briefly indicated under the five following heads—the benefits to health, to traffic, to the labouring classes, to the metropolis generally and to the nation. It is obviously impossible that within the limits of a paper such as this the whole of these reasons for improvement can be adequately treated, but I have attempted this in a work which I shall shortly publish. This evening, and before reaching the main part of my paper, I can only ask you to consider the benefit to the health of the community that would arise from rational improvements.

We all know what has already been done in reducing London's death-rate, but that rate in some of those districts where the population is most dense, such as Bethnal Green, still remains at 40·0 per thousand. It is just in these districts that one of the greatest dangers to the health of London lies. They are the spots on which epidemic diseases fasten, and until they are transformed, progress in lessening the general death-rate will continue to be arrested. Not only so, but London, which was once in the van of sanitary progress, has lost her place, and until the remedy be found will fall further and further behind cities to which she formerly showed the way.

The following figures are taken from the annual summaries of deaths issued by the Registrar-General since 1874, from which date only the death-rates of foreign cities have been included in the summaries.

Death-rate in 12 leading European Cities in 1874 and 1890-91.

Cities.	1874.	1890-91.*	Decrease of Death-rate.
1. Berlin . . .	32·9 per 1,000	20·9 per 1,000	12·0 per 1,000
2. Liverpool . .	32·0 "	23·6 "	8·4 "
3. Birmingham . .	26·8 "	19·7 "	7·1 "
4. Hague . . .	26·5 "	19·5 "	7·0 "
5. Glasgow . . .	31·1 "	25·3 "	5·8 "
6. Turin . . .	26·7 "	22·8 "	3·9 "
7. Rome . . .	27·5 "	23·6 "	3·9 "
8. Brussels . . .	23·9 "	21·5 "	2·4 "
9. London . . .	22·5 "	20·3 "	2·2 "
10. Paris . . .	22·4 "	21·6 "	0·8 "
11. Vienna . . .	24·6 "	24·6 "	Nil
			Increase
12. Dublin . . .	26·0 "	26·5 "	0·5 per 1,000

These figures clearly show the improvement that has taken place in many large cities, and they also show that no material alteration has taken place in the health of London and Paris during the same period. The reason of this is, I think, to be found in the fact that radical changes were being made in those cities which show marked improvement, while in London and Paris little change took place during that period.

For instance, between 1875 and 1885, Birmingham transformed about eighty acres in the centre of the town from squalid slums into fine thoroughfares. Mr. Chamberlain, in his evidence before the Royal Commission on the Housing of the Working-Class, stated:—

The effect on the death-rate has been very remarkable indeed. The eight most insanitary streets in the area before the scheme averaged, for the three years before the proposals were in operation, 53·2 per thousand. Since then, in the last three years, the same streets have averaged 21·3 per thousand, and the scheme in part, with the other causes to which I have referred, throughout the borough of Birmingham, have led to a general reduction of the death-rate throughout the borough from 26 in the thousand for the three years 1873, 1874 and 1875, to 20 in the thousand for the three years 1880, 1881 and 1882.

In Glasgow, the City Chamberlain states that the great municipal work of breaking up the dense foetid closes in the old central districts of the city, together with improvement in sanitary administration, has resulted in the annual saving of the lives of 1,271 inhabitants. This great municipal work was also completed during the period referred to. Similar sanitary and street improvements were being vigorously carried out during this same period in Berlin, Liverpool and The Hague.

No doubt these great strides of improvement were taken in following the example of London and Paris. London had before this period, by the construction of her great sewerage works and other sanitary improvements reduced her death-rate materially, and Paris, by abolishing her slums and transforming herself into a city of wide and beautiful streets, had also reduced hers. But during the later period above referred to

both London and Paris more or less rested on their onward march, for no one can believe that the London death-rate of 20·3, or the Paris death-rate of 21·6, is the ultimate goal of sanitary reform. Many of us, indeed, believe in the possibility of reducing these figures to one-half. That this is no dream is shown by the death-rate of Hampstead, which is 14·7, and by the striking experience of the Artisan Dwellings Company, which is able to boast of a death-rate in its tenement blocks of 12·85.

In attempting to carry out extensive alterations in conservative London many great difficulties and expenses will have to be faced, most of which would not have existed if in the past there had been efficient municipal control. The want of a general plan showing future street alterations authoritatively settled has also undoubtedly been the reason why many streets lately formed are not for the general convenience, have not been financially successful, and have neither created enthusiasm amongst the public nor brought credit to the authorities. Let us examine in detail, and under the following heads, the reasons for having a comprehensive plan, and as complete a comprehensive plan as possible:—

- For discovering the causes of our present inconveniences.
- For producing the best improvements that can be produced.
- For forwarding them as rapidly as possible.
- For making them as economically as possible.
- For æsthetic reasons.

Importance of a General Plan for discovering the Causes of Present Inconveniences.

Immediately a general plan of London is examined by anyone anxious to solve the many problems of our present inconvenient streets, to discover where slums are mostly to be found and the reasons that have prevented improvement, he must be first struck by the fact that many slums exist in the very centre of our capital on sites which, in a well-arranged city, would be the most valuable. The cause of this is soon apparent, and, as usual, the impediment to progress is the English law. Look at the shape and extent of the "Devil's own" estates, which extend a distance of about three-quarters of a mile from Theobald's Road on the north to the Thames Embankment on the south, and which present a barrier against any attempt at opening up the most crowded districts of Central London, of admitting to them more light and air, or of allowing any better means of communication between the City and the West End. Wherever barriers to free circulation exist, whether in a river, in the human frame or in a city, there will be formed an aggregation of scum, of disease or of slums. Now such a want of free circulation exists in Central London, on both sides of the Inns of Court, and hence the unpardonable squalor peculiar to the slums in the central square mile of our capital. The first urgent need for improvement, therefore, as will be perceived by every earnest student of the map of London, is the opening up of these districts by broad thoroughfares which must of course pierce the sanctuaries of the law. Other impediments to free circulation will, unfortunately, be found. South of the Thames, railway viaducts and embankments divide the metropolis into sections and sever contiguous districts, when the trouble, danger and nuisance thus caused would have been entirely avoided by making the lines in cuttings or tunnels as on the north side of the river. Superb public parks and gardens are so enclosed and so difficult of access as to form most serious impediments to street improvement, and the full benefit of their presence is denied us, whilst their surrounding streets are filled to overflowing. A wide tidal river hems in, and is hemmed in by, stifling purlieus that have become crowded and neglected for want of opening up by wide streets and additional bridges. These are but a few of the difficulties that must be removed if London is to be made convenient and healthy. If it is also to be made beautiful, other difficulties have to be overcome. We find many public and other important buildings hidden away in tangled and crowded streets as to be almost unapproachable and entirely forgotten. So forgotten, indeed, that I must mention specimens, such as the Mint, the Record Office, Guildhall, Westminster Town Hall and many of our county courts and coroners' courts. Whilst many hills in our home counties offer sites which are in every way suitable, we find here in Central London asylums for lunatics, schools for the blind, homes for foundlings occupying acres of unsuitable sites in crowded districts, impeding surrounding progress and depriving their hardworking neighbours of healthy homes. Such unintelligible and widespread impediments as these, and many similar ones, will not easily be discovered if improvements are still to be considered in dribblets, such as a street half a mile here and three-quarters of a mile there, whereas they become apparent immediately a general plan of improvements is taken in hand.

Importance of a General Plan for producing the Best Improvements that can be produced.

Probably the best complete scheme of London improvements should embody (a) the complete utilisation of every district of

* During the years 1890-91 influenza was prevalent in parts of Europe, and affected the death-rate materially. For this reason, where the rate seriously differed in any city during these two years, the lower rate is quoted as being closer to the normal rate.

London's enormous area for its most valuable purpose ; (b) the creation of continuous arteries, sufficiently wide for the future as well as for to-day, and judiciously placed so as to connect the most important centres of business and habitation, and the railway termini.

This consideration has up to the present time been entirely lost sight of whenever improvements have been considered, consequently the rehousing of the displaced working population, a question inseparable from improvement schemes in London, has always been a most serious difficulty. As it seems most probable, for many reasons, that improvements will be carried out in the slums before elsewhere, this question still remains of the first importance. I know that it is necessary for the working classes to live within a reasonable distance of their work, but surely it is not consistent with the general welfare to give up the very central square mile of London to such purpose, especially as more comfortable and healthy dwellings can naturally be provided where land is so much cheaper as in parts of Southwark, Lambeth, Clerkenwell and Marylebone. If a map of London be studied acres upon acres of land, which could be made available for workmen's dwellings, and which is most likely always to remain the most valuable and suitable for this particular purpose, is at once discovered within a mile of the centre of the metropolis. Such sites are occupied by the Foundling Hospital, the military school at Chelsea, and many similar institutions, Bethlehem and St. Luke's Lunatic Asylums, many gasworks and water filtering beds. Would it not be well to remove these present occupants into the suburbs or the country, and clear the sites for labourers' dwellings? Some of us might regret the disturbance of old hospitals, but a larger majority of us regret more sincerely what is apparently the only alternative, namely, the removal of workmen to the suburbs, and the consequent loss of time and money in conveying them to and from their work. I have calculated that fifteen sites, which I propose should be gradually devoted to this purpose, contain an area of 144 acres. After deducting one-fifth of this area for additional broad roadways, and, assuming that the same density per acre will be as healthy on these sites as on the site of Peabody dwellings and playgrounds in Drury Lane, the extra number that can be accommodated within one mile of the centre of the metropolis is found to be 127,000 men, women and children.

Immediately a comprehensive plan is studied, the small number of our main streets and the shortness of our other streets is at once manifest. As Mr. Albert Shaw remarks :—"London, like all other old cities, is a vast, tangled network of streets that for the most part begin nowhere and end nowhere." Without doubt, the longer and the more uniform streets are made, the more valuable they become for many reasons. But length and uniformity can only be obtained by first planning streets to a small scale on a complete plan of the whole county. In many cases, too, quite insignificant clearances at various points are only required in order to render many of our side streets suitable for relieving the present overcrowded main streets to a very considerable extent. Every surveyor knows what has been the cause of these small obstructions, and how they are still being created by the absurdities and difficulties that exist in connection with laying out building estates in London, especially in the suburbs. For instance, no matter how irregular may be the shape of an estate which is to be developed, the owner is allowed, in order to follow the contour of his boundaries, and to cover with houses every corner of his property, to make his roads tortuous as snakes so long as they lead from one existing road to another. He is not, however, allowed to form any road which stops at his own fence, no matter how essential such road may be for the development of the adjoining properties. Thus more and more unhealthy and badly ventilated districts are being daily created, whereas if a settled plan were adopted, the development of each property would be a matter of general importance, and while adding to the convenience of the district the property itself would be benefited.

Importance of a General Plan for forwarding Improvements as speedily as possible.

If a comprehensive plan for improvement were authoritatively adopted in London, no single building in the whole county could be rebuilt without reference to the revised lines of frontage as laid down on that plan, or without becoming an integral part of the grand city that it would be the ultimate object of the plan to produce. That such a system would be of paramount importance for speedily effecting improvements will be shown by the following comparisons :—The annual average number of notices for new buildings and rebuildings issued to district surveyors during the last three years has been 21,932. As nearly all our streets admittedly want improving, as many central districts admittedly want entirely remodelling, and as all districts newly created in the suburbs are, at present, created without any reference whatever to the general convenience, we may fairly assume that one-fourth of these 21,932 annual notices refer to rebuildings which would each give an oppor-

tunity of advancing, under a comprehensive plan, the complete scheme for the improvement of London. On the other hand, the approximate total number of houses that will be removed by the Council Broadway improvement is 1,250, and what with legal and Parliamentary delays, this improvement may take about five years to complete, from the time it was first made public. This gives an annual average of 250 houses removed by this costly improvement, compared to 5,500 opportunities for improvement which would annually and automatically arise immediately a comprehensive plan were adopted. Again, it must be remembered that in the one case, every opportunity would come without legal expenses or delay connected with compensation for disturbances ; whereas, in the other case, legal expenses and delays and expensive compensations for disturbance occur in the case of each property taken. If, moreover, a comprehensive scheme be delayed, not only will 5,500 automatic and cheap opportunities for improving London be lost every year, but the very rebuilding on these sites will form the same number of impediments to be removed each ten times as costly as the opportunities that are lost. It is true that Ludgate Hill has taken about thirty years to widen, and I know that this improvement is used as an argument against the so-called "automatic" principle. The case of Ludgate Hill, however, is an abnormal one. The greater cost of the properties more recently acquired there have been due to the fact that Ludgate Hill has been allowed to remain, practically, the only main line of communication through that part of London. All the enormously-increased traffic is forced through that artery, with the result that its frontage sites have increased in value to an unnatural extent.

(To be continued.)

The PRESIDENT said the subject was one of great interest to Londoners. If they did not agree with all Mr. Cawston had said, they would agree that he had taken a very comprehensive view of a very comprehensive subject. They had the pleasure of having members of the London County Council present, and he asked them to express their opinions.

Mr. FREDERIC HARRISON, chairman of the Improvements Committee of the County Council, on being invited to speak, begged to be excused entering into a discussion. He only rose to thank them for their courtesy in inviting him and his colleagues to be present on the occasion, and having thanked them he considered he had done his duty. He had come to listen, to learn and be corrected, and not to make a speech. He hoped the members of the Institute would not suppose that the London improvements which had been attempted did not proceed on a settled plan. It was true there was no settled scheme that was open to the public, for the excellent reason that it would probably lead to wide-spread land speculation. As chairman of the Improvements Committee it might become his duty to speak on the subject before committees of both Houses of Parliament, and therefore he could not say anything prematurely. By an automatic scheme was it meant, he asked, a scheme that the Council could carry out without an Act of Parliament? Also it was proposed that the Council should gradually purchase property in order to carry out a comprehensive scheme. He did not know where the funds were to come from ; at present the Council had not a penny with which to purchase a single piece of slum property. Then if such a scheme were publicly adopted some persons might think it worth while to anticipate the County Council. The scheme could not be carried out for a long time, and it occurred to him how was the property to be valuable during the thirty years before the scheme could be carried out. He would suggest to Mr. Cawston before approaching the County Council that he should first turn over in his mind the financial part of the question. In listening to Mr. Cawston he made a rough calculation that the scheme would require an outlay of 150 millions sterling. He saw no way of raising that sum. If another great fire of London occurred he had no doubt the Institute would furnish another Wren. Of course there were some things which might facilitate carrying out parts of the scheme—for instance, if the Council had the power of making Acts of Parliament without going to Westminster for them, or if the Institute could persuade Parliament to let the Council have 150 millions of money.

Dr. LONGSTAFFE, chairman of the Building Committee, was then asked to speak. He said he did not think it was in order that he and other members of the County Council should monopolise the time of the meeting. He thought Mr. Cawston had somewhat underrated the difficulties of the matter, but it was good advice that they should look ahead. His committee had already given much time and thought in the direction of something like an automatic procedure. There was something wanting, too, in the Metropolitan Management Act, which, if amended, would meet certain difficulties. According to sanitary authorities, instead of a hard and fast rule for width of streets and height of houses, all that was necessary that the dimensions should be sufficient. The statement of the death-rate was something of a libel, as the figures given only applied to a

small area in Bethnal Green. His committee had got much good for Londoners out of the landlords. The landlords often wanted something, and offered advantages in return. Mr. Cawston's statistics in general must also be read with caution. It was comparatively easy in a very unhealthy town or city to reduce the death-rate very quickly and greatly by dealing with the unhealthy areas, &c. The insanitary conditions got rid, of course it was harder to reduce the rate. He believed that London was still the most healthy city in the world. In earlier days insanitary conditions prevailed, and cities were only populated by continually being replenished from the country. Now, indeed, children could be reared in London, and reared healthy and strong. The tendency of people to live in cities was all the more reason to make them as sanitary as possible to prevent deterioration of the race. One of the greatest difficulties they had to deal with was that London was made up mostly of small parts, such small pieces that had to be purchased and cut to waste.

Mr. RALPH NEVILL, F.S.A., said he did not think they should copy Paris. Crooked streets were often picturesque, and not always obstructive to traffic. They could scarcely take any line without pulling down some large buildings. There were plenty of areas covered with small buildings that could be pulled down and rebuilt without taking away what were really open spaces—the areas occupied by Bethlehem Hospital, &c. St. Luke's he would not object to if it were removed. He objected to a street crossing at right angles. Rather than that, the opposite street should start a few yards higher up or lower down the thoroughfare to be crossed.

Mr. JAMES NEALE, F.S.A., said that in no sense did Mr. Cawston speak for any member of the Arts Committee nor for any other member of the Institute. He thought it was absurd to show such a dream of a plan. They had to learn from county councillors and not the county councillors from architects.

Mr. ALFRED WATERHOUSE, R.A., said the speeches of Mr. Harrison and Dr. Longstaffe had rather cut the ground from under him. He thought that a thoroughly well-considered plan for the gradual improvement of London should be carefully matured. He was also surprised to hear that the County Council were working from a well-matured plan. In a multitude of councillors no doubt there was wisdom, but he would suggest that the plans, if not as mature as possible, should be made so, and that the plans should in some way or other be submitted to experts. He proposed a vote of thanks to Mr. Cawston for his paper.

Mr. H. H. BRIDGMAN seconded the vote of thanks. He mentioned the plan of the City Commissioners of Sewers for a street from the Tower Bridge to Aldgate, and thence possibly further in a north-westerly direction.

Mr. FRANCIS COOPER referred to Paris as a city where, in addition to the great improvements, many gradual changes had been going on for a number of years.

Mr. LEONARD STOKES explained his scheme for the improvement of Hyde Park Corner and Piccadilly, as shown by his drawing, exhibited along with another by Mr. H. P. B. Downing, showing pictorially a proposed Strand improvement.

The vote was passed by acclamation, and Mr. CAWSTON, in replying, said his book would deal more fully with the scheme he had outlined.

THE ISTHMUS OF CORINTH.

THE scheme for cutting a canal across the Isthmus of Corinth appears to be rapidly approaching completion. The concession was originally granted by the Greek Government in May 1881 to General Turr, with whom was associated M. de Lesseps. After the original capital had been absorbed and the operations for some time suspended, the operations were taken up by a new company, which, in 1890, entered into a contract with a firm which undertook to complete the works on March 10, 1893, under a penalty of 4,000*l.* per month for any delay after that date; but unfortunately about this time last year a water-spout passed over the works, flooding the excavations. This disaster necessitated a slight extension of the term, but the contractors now promise that a large steamer will go through the canal on April 23 next. Great efforts are being made to render the system of lighthouses adequate. The Corinth Canal, which will have cost from first to last two and three-quarter millions sterling, will be lit by electricity, with two powerful lights at each end, and a row of lights through its entire length.

PUBLIC LIBRARIES.

A MEETING of the Architectural Section of the Philosophical Society of Glasgow was held on Monday. Mr. Campbell Douglas presided. Mr. George Washington Browne, architect, A.R.S.A., Edinburgh, read a paper on "Public Library Planning." The lecturer said that, following the

development of School Board planning which resulted from the adoption of the Education Acts, which reduced planning to fixed rules, he sought to see if some such rules could not be laid down applicable to public libraries established under the Public Libraries Act. For that purpose he had prepared diagrams of half a dozen libraries which had been erected throughout the country from plans selected after public competition, and from these he had deduced a table which gave the following results:—That the number of square feet of floor-space per reader in the newsroom averaged 20, but in the reference-room the conditions were so varied that it was difficult to arrive at any result. In the lending libraries about 13 lineal feet of bookcases, accessible by hand from the floor, was required for every thousand volumes to be housed; the length of surface counter was about 23 inches for every thousand volumes. The area of floor-space should be 80 feet per thousand volumes. He further showed two plans by which, under exceptional circumstances, these floor-spaces might be reduced to 58 feet or 48 feet. But they were not to be taken as the figures looked for, but rather a theoretical standard towards which the designer's aims should be directed.

GENERAL.

The Exhibition of the Aberdeen Artists' Society is to be opened on the 14th inst., and it is expected that Lord Huntly will perform the ceremony.

Mr. F. H. Newberry, Glasgow School of Art, gave a lecture in the Glasgow Corporation Art Galleries on "The Art of Yesterday and To-day," in which he spoke of the meaningless nature of present-day architecture, and deplored the deterioration that art had undergone since the days of what he termed "the Classic period." In some far-off century they would find in the whole area now covered by Glasgow only one single structure giving evidence of an artistic taste—the cathedral.

Mr. Lawrence Banks, hon. secretary of the Royal Cambrian Academy, and an artist well known in Wales, died somewhat suddenly at noon on Saturday, the 28th ult., at his country residence near Bangor.

The "Church Reformer" for the current month contains an article on church restoration by Rev. T. Perkins.

Mr. A. Marshall, A.R.I.B.A., gave a lecture in the Nottingham Castle Museum to the members of the Arts Society on "Rome, Ancient and Modern."

Mr. H. Athron, architect, has been instructed to prepare the plans for a new Baptist church for Doncaster.

Sir Richard Bulkeley, Bart., has given to the Anglesey County Council a plot of land at Llangefni for a site for the erection of county buildings.

The Chancellor of the Exchequer states in a letter to the St. Saviour's (Southwark) Vestry that the Government has accepted Mr. Tate's offer, and that there was now a probability of the British Gallery of Art being established on a satisfactory basis.

The "Illustrated London News" says the will and codicil (both dated December 19, 1892) of Mr. John Gibson, late of 13 Great Queen Street, Westminster, architect, who died on December 23, were proved on January 14, the value of the personal estate amounting to over 53,000*l.* The testator bequeaths 500*l.* to the Architects' Benevolent Society.

Mr. J. W. Willis Bund, at the meeting of the Birmingham Architectural and Archaeological Society, read an historical paper entitled "The Domesday Book," which is to be incorporated in the proposed work on Worcestershire history.

The Society of Engineers will meet on Monday, the 6th inst., when the president for the past year, Mr. J. W. Wilson, jr., will present the premiums awarded for papers read during the year. The president for the year 1893, Mr. W. A. M. Valon, will deliver his inaugural address.

Mr. John Holden, F.R.I.B.A., will read a paper on "Materials and Construction" at the meeting of the Liverpool Architectural Society on Monday, the 6th inst.

M. Garipuy, the director of the Ecole des Beaux-Arts in Toulouse, has died there in his seventy-sixth year. Among the artists trained by him were M. Falguière, the sculptor, MM. J. P. Laurens, Debat-Ponsan, Henri Martin and other painters.

Mr. J. P. Jones, architect, Cardiff, has died in his forty-second year. He had secured one of the largest practices in the town.

The Surveyors' Institution meets on Monday, the 6th inst., when the adjourned discussion will be resumed on the papers by Mr. P. D. Tuckett and Mr. A. Goddard.

The Town Council of Bristol have decided to proceed with the promotion of a Bill in Parliament for the construction of new docks at Avonmouth and Bristol, at an estimated cost of nearly one and a half million.

The Architect.

THE WEEK.

THE project of a new city hall in Belfast has been revived. Three years ago an Act was passed authorising the erection of the building on what is known as the Linen Hall site, but owing to the operation of some novel clauses a final decision on the subject could not be given heretofore, nor until next November. Last week the improvement committee proposed that a competition for plans should be arranged, the prizes being 250*l.*, 150*l.*, and 100*l.* The sum proposed for the building was 120,000*l.* The site assigned occupies about one acre of an open space, which is to be laid out as a garden, and containing five acres. As rent from tramways, amounting to 4,000*l.* a year, will be available next year, and will be subsequently increased, it was concluded that the building could be erected without any increase of the taxation of Belfast. It was not intended to limit the competition to architects practising in Belfast or Irish architects. A few years ago we expressed an opinion about a similar project which, practically, was shelved. At last week's meeting of the Corporation the policy of delay was again adopted. It was suggested that as no definite decision could be given until November, there was little use in seeking plans until after that month. That view was finally taken by the members, and it may be assumed that the competition for a new town-hall is once more abandoned. The history of the project does not say much for the business qualities of the citizens of Belfast. Like the people in other parts of Ireland, we are afraid they are desirous to escape from the obligations that were undertaken by them.

THE Munich architects have succeeded in their agitation concerning the proposed Bavarian Museum. It will be remembered from what we have already stated that the Government were inspired by the modern notion of economists and officials, viz. that in a building, and especially a museum, it matters little about inside or exterior appearance so long as the plan is well arranged. Accordingly, it was decided to entrust the design to the official architects. It was also said that the grant was given on the consideration that the building was to be of an economical sort. The non-official architects remonstrated. During several months there was much discussion about the subject in Munich. A consultation has been at length held, in which representatives of all who are interested in the museum took part. The Cultus Minister presided, and the proceedings lasted for four hours. It was finally decided that sketch plans for the buildings should be obtained in competition, and that the programme will be prepared by Herr BERNASS, the oberbaurath, the director and conservator of National Museums, and three professors of architecture. Considering the power of officialism in Germany, it is a great victory for the private architects.

TRAVELLERS at home and abroad, as well as many other people, are often puzzled concerning the whereabouts of clubs. Mr. E. C. AUSTEN LEIGH has brought out a very handy "List of Clubs frequented by the English in all parts of the World." Now that the information has been given people must wonder why such a list was not published long ago. The little book will be a useful companion for travellers, and we may add it is likely to be considered as indispensable by all merchants and manufacturers who have business relations with colonial or foreign towns. It is published by Messrs. SPOTTISWOODE & Co.

THE Bradford School Board are endeavouring to persuade other boards to unite with them in obtaining a more general recognition of the value of central halls by the Education Department when calculating the accommodation of school buildings. In some cases the Department act as if the hall did not afford any accommodation except in the case of three mixed departments, in which each room is recognised as only accommodating one class of sixty scholars. It appears to the Bradford Board that the halls should be reckoned in the accommodation of the school, and that they

are as useful for two classes as for one. The matter is serious, as the cost is equal to about 10*l.* per child. Another grievance is pointed out by the Bradford Board: they have experienced difficulty and delay in getting plans passed by the Department, and they are of opinion that Circular 270 of the Department authorising the Department's architect to charge fees to school boards and other school managers for suggestions and conferences ought to be withdrawn. It is proposed to ask the Vice-President of the Council to receive a deputation on these subjects.

THE atelier of a Paris sculptor is hardly the sort of treasury that would appear attractive to a thief, but M. FALGUIÈRE can testify to the contrary. His premises in the Rue d'Assas were entered lately, and a piece of old tapestry, on which was represented *Hercules killing the Lion*, was carried off. The thieves made a parcel of a second piece, but through some unknown cause they were compelled to leave it behind. Tapestry is not the class of goods that can be readily sold to a receiver, and the police of Paris will not gain much credit if M. FALGUIÈRE's property remains undiscovered. But as they have failed to catch the ingenious rascals who stole the seven valuable paintings by Dutch masters, with other property, from the mansion of the Marquis DE PAMSSE-PASSIS, and who were admitted as agents of the Préfet, it is to be feared that the size of objects need no longer be an obstacle to the removal of property. The paintings comprised a soldier and the eternal white horse, by WOUVERMANS; *An Interior of a Church*, by PETER NEEFS; *A Landscape*, by RUYSDAEL; *Christ and the Samaritan Woman*, by VAN MIERIS; *The Golden Age*, by VAN WAËL; *A Dentist* and *A Topper*, by TENIERS. The Marquis regrets more the loss of family jewels than his pictures or other property.

THE City Council of Toronto, Ont., has recently passed a by-law respecting the erection of scaffolds. It prescribes that all scaffolding used by carpenters in the erection, repairing, altering or improving of buildings, chimneys or other structures, shall be built and constructed as follows: All uprights of said scaffolding to be 4 by 4, sound and free from objectionable knots, the brackets nailed to them and to the building, and to be 1 inch in thickness and not less than 10 inches wide, properly nailed to building and upright; and when there is no opening to nail said bracket, then a piece 1 inch thick and 6 inches wide to be notched to secure the bracket, and nailed solid to the wall and to the upright. The boards laid on this to walk on to be 2-inch plank, sound and free from knots, or else two 1-inch boards, laid one on top of the other. When bracket scaffold is put up the leg to be sound, and not less than 2 by 6 on edge, set at the proper angle to prevent the bracket from tipping from the wall. When scaffold projects from windows, the brackets to be 1 inch thick by not less than 10 inches wide and 6 inches deep, both brace and bracket well nailed to window, and the brace well nailed to bracket also.

THE correspondence which has passed between Mr. LENG, M.P., and Mr. MUNDELLA, president of the Board of Trade, will have been of service if it lead to a practical amendment of the patent law in this country. The correspondence is valuable not so much for the suggestions as to how the law may be altered, but because it should draw the attention of the public and the Legislature to the need of improving the conditions under which patents are taken out. Great Britain, the United States of America, Germany and other European countries have their respective systems, but none of them in all desirable respects meet the real needs of business, nor the interests of inventors. Probably no amendment of our system would be effected by adopting the regulations of the American or foreign systems. At the same time, it is certain that there is no lack of practical knowledge of business requirements in this country. It is only necessary that some among those who possess this knowledge should be commissioned to point out how our present system can be amended in the interest of invention and inventors without any violent or drastic changes. So far all systems have failed in many respects as tried in the balance. Great Britain, however, can easily if she chooses be the pioneer in the needed improvement.

THE BOULLES.*

THE series of "Artistes Célèbres," as our readers are aware, is not confined to painters and sculptors. It has already comprised biographies of BERNARD PALISSY, the potter; JEAN LAMOUR, the Nancy blacksmith; LIGIER RICHIER, who was probably the last of the provincial "ymagers," and now we have notices of some members of the family of the BOULLES, whose names are associated with decorated furniture of a peculiar class.

The case of ANDRÉ-CHARLES BOULLE exemplifies how easily immortality can be gained by the poverty of language. Dr. JOHNSON tells a story of a man in an inn who was surprised because he was unknown. He had a right to be aggrieved, for he could say, "I am the great TWALMLEY, who invented the floodgate iron." If he had not been fond of resemblances, and called his invention the "Twalmley iron," he was likely to be famous then and now. The French language had not a word or phrase to designate the sort of veneering and inlaying which ANDRÉ BOULLE introduced or employed. Other languages were as ill provided for the emergency, and in consequence the artist's name was used as a substitute. If the historian of Cornwall could say of one CHING, "The Patent Worm Lozenges have gained our Launceston apothecary a large fortune and secured to him perpetual fame," and if, as the poet predicts, "ISAAC's rigadoon shall live as long as RAPHAEL's paintings or as VIRGIL's song," may we not hope that the name of BOULLE will survive longer than those of some of his famous contemporaries? His name is not mentioned in the "Siècle de Louis XIV.," but how many great people are described in the pages of that history whose glory has been as unsubstantial as the sound of a trumpet?

What is more remarkable is that BOULLE's style is supposed to be inspired by principles that are wrong. Wealthy people give enormous sums for examples of his work. A pair of his armoires were sold at CHRISTIE'S in 1882 for 12,075*l.* and a small cabinet for 2,310*l.* But if a modern furniture-maker were to bring out pieces in the style he would not receive enough to pay the cost of labour. BOULLE's countrymen are chary of imitating him, and in the last French exhibition there was not one important example that denoted a desire to keep up the traditions of his inlaying. Fashion in furniture has run into a variety of forms, but for Boulle there seems to be no chance, although veneering, which is supposed to be a characteristic of our age, is better suited to it than to many other classes of work.

It does not always happen that neglect of an old way of employing materials is commendable; but if logic counts for anything in decoration, Boulle work deserved to be superseded. With it means of adornment are not subsidiary. The material that is used for a piece of furniture is treated as if it were only a foundation for inlaying, and was to be concealed. We may assume that wood was employed by BOULLE in every case, because that is the tradition; but there can be no certainty without such an examination as is rarely possible. He was willing to adopt forms for his *coffrets* and *gainés*, or pedestals, that were supposed to be employed only with metal castings, and when compelled to impart more or less resemblance to a wooden wardrobe when constructing his armoires he was careful to conceal his debt. BOULLE was not merely a decorator; he might be called a manufacturer of materials. The furniture-makers of that age were like him, for they twisted wood in defiance of all natural principles, and covered it with colours and gilding as if they wished to suggest that the material employed by them for the distorted forms was not derived from common trees. BOULLE went further, for he combined metals, ivory, shells and enamels in his pieces, while sculpture and engraving imparted additional interest to natural products. In that way he was able to produce furniture that for magnificence was without known precedent, and was therefore adapted to be deposited in the palaces of the Grand Monarque. With all its defects, BOULLE's work was less factitious than many other things in that reign that were dedicated *viro immortalis*.

From the indifference of contemporary writers about BOULLE, we might conclude that his work did not find much approval outside the Court circle. Even there we have no record of admiration for any of his productions. Why was it that Madame DE SÉVIGNÉ could gossip so delightfully about BIANCONELLI, the harlequin, and the stone he carried as a specimen of the house he was to build; about HÉBERT and VATEL, and yet remain silent about the new cabinets, bureaux, commodes, cassettes, &c., which might be supposed to captivate feminine imagination? The answer is that in those days there was among the arts a division corresponding with the *grandes entrées* and the *petites entrées* of the Court; the industrial artists were restricted to the humbler one. BOULLE was only an "ébéniste, faiseur de marqueterie, ciseleur et doreur," and to the courtiers was not more important than are the carvers and gilders to the visitors at a private view of the Royal Academy. The indifference is, however, not serviceable to biographers. When the time arrived in which BOULLE's life became a subject of interest, it was too late to discover all that people wished to know. As has happened with greater men, he can be only partially revealed to posterity.

The obscurity sometimes appears to be brought about by other forces besides accident. For instance, it is well known that ANDRÉ-CHARLES BOULLE was one of the privileged artists who were allowed to reside in the Louvre. He obtained that position on the advice of COLBERT, who said that, as an ébéniste, "le nommé BOULLE est le plus habile de Paris." That was in 1672, when the artist was in his thirtieth year. Now the earliest author who mentions the artist was an Italian, the Padre ORLANDI, author of the "Abecedario pittorico." Writing in 1719, he said that BOULLE was at once architect, painter, sculptor, mosaicist, ébéniste and designer. His inclinations were towards painting, but his father, who was an ébéniste, compelled him to follow that craft. It appears that from 1619 until 1636 there was a PIERRE BOULLE, who was the king's ébéniste, lodging in the galleries of the Louvre. He was a Calvinist, and was the father of several children. It would be readily assumed that ANDRÉ-CHARLES was one of his sons. But that is unwarranted. ANDRÉ was a Catholic, and his father's name was JEAN. We thus see that in the beginning of the sixteenth century there was more than one family of BOULLE who were cabinet-makers and residents of the Louvre.

The workshops in the galleries were an excellent school for students, and from the variety of artists who worked in them it is no wonder that BOULLE and others became remarkable for their versatility. But of the details of his education nothing is known. When his name appears in an official document he was accepted as the first of his craft in Paris.

Unfortunately the accounts of expenditure on works for the palaces, which are so precise in other ways, have not many entries about BOULLE. In 1669 400 livres were paid to an artist of the name on account of paintings, and in 1675 the large sum of 5,488 livres was paid to one BOULLE for transport of trees. Whether the ébéniste's versatility was equal to painting and gardening is not to be determined. The real BOULLE appears to have been employed between 1673 and 1675 on a dais in the queen's chamber. In 1681 he was paid 8,000 livres for an organ-case with ornaments of gilt bronze, and in 1679 he received 1,000 livres for a table which was enriched with marquetry of copper encrusted with tortoiseshell.

LOUIS the Dauphin, the only son of the Grand Monarque, was born in 1661, and in 1680 he married a Bavarian princess. His part of the palace of Versailles was not extensive, but it was made so attractive by mirrors, gilding, marquetry and furniture that princes and ambassadors were supposed to be favoured by seeing the rooms. BOULLE appears to have executed several novel works for the Dauphin and his wife, besides the parquetry of the rooms. He was paid 21,900 livres in 1682, and the following year the sum was 38,000 livres. French princes at that time were only tenants-at-will, and the parquetry was hardly completed when the Dauphin was evicted and sent to another part of the palace. He was, however, allowed to transfer the parquetry, and to adapt it to rooms of a different plan. The new position, from its dampness, was not favourable to the work. In 1687 BOULLE endeavoured to

* *Les Artistes Célèbres: Les Boulle.* Par Henry Havard. Paris: Allison et Cie.

repolish and repair the parquetry, but after the death of the Dauphin, in 1711, the rooms were not inhabited, and finally the parquetry was taken up and allowed to decay in the Garde-Meuble. It is to be regretted that so little is known about that class of BOULLE'S work which may be called architectural. In the curious portrait which is presumed to represent himself, and is executed in marquetry, we see introduced in the background a sort of throne with a screen, or it may be a very large cabinet, that seems to be broadly treated, and standing apart is a Chinese pagoda. Over the screen is a large framed mirror, and towards the foreground are balustrades. The figures suggest varieties of work beyond those which are credited to BOULLE.

The orders which BOULLE received from the Court and from others are not to be ascertained. Occasionally a document is discovered which shows that outside France his work was sought. He sent furniture to Savoy, Lorraine, Spain, Germany, &c. It is likely that, as long as his work was in fashion, he was liberally patronised.

BOULLE was, however, less able as a man of business than as an artist. In 1697 he brought an action against CROZAT, one of the richest financiers of the time, who declined to take pedestals and armoires which were not of the prescribed dimensions. BOULLE failed. In 1720 a still greater disaster befell him. During his life he was an enthusiastic collector of paintings, drawings and engravings. As he possessed influence at Court he was enabled to obtain space to accommodate his treasures in the Louvre. In a neighbouring workshop some timber was set on fire, and the flames soon reached the rooms assigned to BOULLE. Some specimens of his furniture, which he had prepared for LOUIS OF BOURBON, who was the first Minister of LOUIS XV. were saved, the works of art which BOULLE had accumulated perished.

A remarkable memorial was prepared by BOULLE, in which he gives details of his losses, with the hope that the Government would give him some compensation. It appears that he employed twenty workers in wood and six workers in bronze. The tools destroyed he valued at 4,200 livres. He was most careful to keep a stock of seasoned wood, and he valued it at 12,000 livres. Then there were several cases of veneers, coloured woods, panels of marquetry representing birds, leaves, flowers, ornament, &c. There were numerous models in wax by famous sculptors, and some in clay by himself and his sons. In some workshops were pieces of furniture in various stages of preparation. If the pictures, designs, &c., were included, the loss to BOULLE amounted to 370,770 livres, or, say 15,000*l*.

The inventory affords us a glimpse into his manner of production. He employed seasoned wood not only for the construction of the pieces, but for the veneers. At first he used to cut his veneers singly, but with experience he found he could, by placing two or three together, cut them with one operation. He was also able to make his inlays correspond exactly with the hollow parts, like the two parts of a die. He sometimes employed woods of various colours, silver as well as brass, tortoiseshell and ivory, copper and mother-o'-pearl. It is not believed that he designed all his works, and JEAN BÉRAIN, the engraver, who was in request as a designer of decorations and ornament, may have often aided him. In other ways he was able to utilise the ability of CUCCI, VAN OPSTAL, BALLIN, WARIN and DUVAL. But the credit for the modelling of masks and other works in metal, and for that co-operation which secured so much unity of character amidst the abundance of detail, is given to BOULLE. His pieces may be too fine for everyday use, and therefore are wanting in one of the essentials of furniture, and with such a combination of diverse materials, with their varying susceptibilities to temperature and time, it was not to be expected that they would wear well; but as a class apart in furniture they will always merit attention. From their defects as well as their merits the designer can derive instruction.

BOULLE'S latter days were not prosperous. It was customary with him to obtain advances on his commissions, and it is to be feared the money was too often expended on pictures and drawings rather than on materials or labour. The objects which ministered to luxury, and which are so perfect throughout, were produced under harassing circumstances. The Louvre was not a refuge against the invasion

of creditors and bailiffs who were clamorous for payment. Complaints were made to MANSART about the desecration of the palace, and the architect duly reported the affair to the king. The great LOUIS was not always out of the ébéniste's books, but he was not disposed to approve of the ill-management by which the royal name received a slur. Yet, in spite of all that French law could do, BOULLE continued to live for about ninety years. One of his sons appears to have been imprisoned for the paternal debts, but the old man died peaceably in the Louvre one morning in March 1732, surrounded by four sons, who, like himself, were among the royal workers in wood. He was buried in a little cemetery which then nearly adjoined the palace, for it belonged to the church of St. Germain l'Auxerrois.

The four sons of BOULLE do not appear to have reached even the financial success of their father, and all gave trouble to creditors. Their work would hardly fail in style to resemble that of the great improver of marquetry, but it is no longer possible to ascertain whether one of the younger BOULLES possessed any individuality. It was their interest to allow their pieces to be accepted by connoisseurs as the genuine work of their father. It is, however, too evident that in most of the large collections of BOULLE'S works there are some examples which are deficient in the qualities which we associate with his name. Lady WALLACE may be congratulated on possessing one of the few collections in which all the objects may be accepted as produced by BOULLE, or under his supervision.

It is no easy task to make a biography of an artist whose life was uneventful, and who left no records because he could not have contemplated that posterity would care about his doings. M. HENRY HAVARD has, however, utilised the scanty materials with skill, and his book is not only interesting but useful to all who are concerned with the history of furniture.

LONDON IMPROVEMENTS.

(Concluded from page 91.)

NOT only do the foregoing arguments prove the greater speed at which improvements can be made under a comprehensive scheme, but they also prove how a great saving in cost can be effected. There are many other economic reasons for a comprehensive scheme. For instance, when any isolated improvement is put in hand, it is necessary to calculate the approximate cost of the whole work, to borrow money to pay for it, to agree to complete it in a given time, and to refund, within a certain number of years, all that has been borrowed. In this way the cost of improvements is greatly augmented, for it not only includes the cost of the actual work, but a large annual amount for sinking fund, interest and the accompanying expenses. If a comprehensive scheme is ever adopted, this running into debt will be totally unnecessary, for the Council would then be enabled to put just so much of the scheme in hand as the funds available for that purpose from the year's income would permit. Again, one of the great impediments to street improvements, up to the present time, has been the terrible cost of acquiring properties, and it has been found again and again that whenever an improvement has been decided upon, speculators have bought up the property, have had drawings prepared for new buildings, have improved existing buildings and put all possible legal impediments in the way for the sake of making the authorities pay largely augmented compensations. The economic importance of adopting a comprehensive scheme is here again apparent, for it would be impossible for any individual or even any syndicate to purchase all the land which will be affected by the whole scheme, consequently the Council would have so much choice that they could purchase small portions here and there whenever the owners wanted to sell or were willing to sell at a reasonable price. Mr. Chamberlain's experience on this point during the municipal improvements in Birmingham, as stated by him in his evidence before the Royal Commission on the Housing of the Working Classes, conclusively corroborates the correctness of this view. It is also absolutely essential that a settled scheme should be adopted for another reason. As each new street is laid out, quadrants and places should be constructed with junctions left exactly where future new streets will eventually join them. A striking illustration of the want of this may be found in the case of the English Opera House recently erected in Cambridge Circus and Shaftesbury Avenue. This building has been placed exactly where a new street, which may become as important as Oxford Street or the Strand, should cross that circus. As already stated, large and most valuable sites are still occupied with slums of the poorest

description. Under a settled scheme the whole of these sites would gradually be put to their proper uses, and the recoupment that would then arise from the sale of surplus lands would go far towards the economic success of the improvement. A striking example of increased value has occurred at Chelsea, on the estate belonging to Earl Cadogan, who was advised on high authority to let a piece of ground at a ground-rent of 85% per annum. Because the whole neighbourhood has been developed in a statesmanlike manner, land has increased so much in value that the ground-rent of this same piece of ground has been, within five years, improved by the leaseholder to 900% a year. Not only so, but certain adjoining land, which is held in trust for the public, has increased in value by the action of the noble neighbour to at least 300 per cent. If a comprehensive plan of improvements were adopted all the undeveloped land in the county would, as it became ripe for development, also be automatically, and thus economically, opened up in accordance with the scheme. Both the community and the landowner would benefit by this, the former by having its streets made in the most convenient position from a public point of view, and the latter by being guaranteed a greater number of important thoroughfares across his property.

The reasons I have already put forward are of a practical nature. I now give some æsthetic reasons, first, for providing sufficient improvements without interfering with our ancient architectural monuments. "The works of those," said Sir Joshua Reynolds, "who have stood the test of ages have a claim to that respect and veneration to which no modern can pretend." This spirit of veneration, together with the knowledge that whatever improvements now made will be carried out in a time when ancient architectural monuments will be as jealously guarded as ancient sculptures and paintings, is a consoling thought when we think of the delays that have occurred in our street improvements. Is it possible that any scheme can produce sufficient improvements to an ever-increasing metropolis like London, without of necessity doing away with well-known landmarks, which, be they ever so faulty, have naturally become endeared by familiarity? Undoubtedly, and at once, I say Yes. For I know with what intense relief this will be received by antiquaries of a conservative nation, whose delight for comprehensive improvements has never been roused. What Londoner is there who would not regret any interference with St. Mary-le-Strand, with those awe-inspiring columns which denote the entrance to Exeter Hall, with the narrowness of Bond Street, or with those solid English walls which encircle the precincts of Marlborough House, Devonshire House, and the modern æsthetic Lowther Lodge. Such sights are to us as precious as a Lord Mayor's Show; and do not let it be thought that I consider this anything but a compliment to the "sticks and stones," for I thoroughly endorse every word of the somewhat cynical article on that interesting and popular ceremony which appeared in the *Times* of November 10 last. By studying a comprehensive scheme, it is soon discovered that sufficient lengthy arteries connecting the most important centres of business and habitation can be provided in such a way as would not only obviate the interference with our present main streets, or with such heirlooms and landmarks as I have mentioned, but would make these monuments more conspicuous by isolating them. For this reason alone such a scheme should commend itself to some of us.

Secondly, for raising municipal enthusiasm. What has been up to now the despair of all reformers of London municipal life? Has it not been the huge size of the city, and the supposed impossibility of uniting for one common object the inhabitants of its distant parts? Can anything be more calculated to raise the pride and enthusiasm of all Londoners, and weld them together for one common object, than a really great scheme of improvement? As each rebuilding in each district progressed, every Londoner would actually see a further development of that grand city all would have agreed to produce. Can one imagine the enthusiasm and pride that would be roused, some few years ahead, as the last block of houses in each new thoroughfare gradually came down, and for the first time an uninterrupted view of the new street, with its palatial architecture, was obtained. This has proved to be the case both in Paris and in Birmingham. Mr. Chamberlain, in his evidence before the Commission on the Housing of the Working Classes, said, when speaking of the transformation of Birmingham:—

The original object was to carry a wide street through the insanitary district, and thereby to ventilate the whole district, because nothing appears to be more absolutely true than that wide streets contribute to the health of great cities; they are, in fact, the lungs of the place. In order to get anything like a through ventilation it was necessary that this street should be continued into the centre of the town, otherwise it would have come out and been blocked, as it were, by rows of lofty buildings. But in addition to that the combination also had the effect of cheapening what I may call the insanitary part of the scheme, because by bringing this poor district into communication with the centre of the town, additional value was given to all the property after the improvement was made. Then there is a third

reason, which is not unimportant, and that is that by the combination of these two things the scheme was greatly popularised with the ratepayers. The great cost of these schemes is, of course, the great difficulty that local authorities have to face, but by the combination of the two things—that is to say, by providing what is a necessity for very growing towns, and a great town improvement at the same time—we were able to carry our proposals, I may say, practically with unanimity in the town. There was no opposition whatever made to the proposals which were laid before the town or to the cost which it was understood would be entailed upon the rates.

I will not risk tiring you with the many and weighty reasons which induced me to adopt six general principles, upon which I have already considered a draft comprehensive plan of London improvements, but I will acquaint you with those principles:—
1. To open up portions of our town parks, and some other open spaces. 2. To open out the most crowded districts, and admit more light and air. 3. To create many more great arteries connecting the most important centres of business and habitation. 4. To provide additional bridges over the Thames. 5. To facilitate the approaches to the several railway termini. 6. To open out as much as possible our public and ancient buildings, and to provide sites for new. Such principles as these seem to me to be fixed and immutable. In order to show how they can be applied in the case of London, I exhibit here an Ordnance sheet, on which I have traced those new streets which to me seem to be ultimately essential for the development of the central portion of the capital.

I venture to think that the true lesson to be drawn from this plan is that it shows how much a settled scheme would have accomplished almost automatically towards improving central London in the past few years, and how supremely important it is that the adoption of such a scheme should not be unduly delayed. The plan serves also to show what an unimportant part the proposed Council Broadway must play in any really effectual general plan of improvements. Apart from a general scheme this roadway has been boldly conceived; but alas, it only proves that the best isolated street improvements must be doomed to failure unless they form an integrant part of the whole street system. Let us apply to the proposed street the six essential principles for the general rearrangement of the London streets which I have ventured to lay down, in order to show how far this street will possess the vital requirements of an important thoroughfare.

1. So far from opening out the only open space in its immediate neighbourhood—the comparatively large area known as Lincoln's Inn Fields—the high buildings that are sure to be erected on both sides of the new street will form a yet more formidable barrier to the free circulation of air from that space. This open space should, if opened out by a great thoroughfare, become one of the most attractive spots in central London, even rivalling in its usefulness and beauty so famous a centre as the Place de la Concorde.

2. As regards opening up the poorest, unhealthiest and most crowded districts in London, the proposed position of the street is excellent.

3. As to the width of the street. A hundred feet as proposed will probably be sufficient both for present and future needs, especially as, from its position, it can never become a really important thoroughfare or an integrant part of any complete system. As to the length of the street. If the street be formed as shown, with the impossibility of its being continued further towards the south, I venture to prophesy that the southern portion will not be financially successful, but will remain another wide and empty street, like Gray's Inn Road, Conduit Street, Garrick Street, Vauxhall Bridge Road and Portland Place, for what proportion of travellers from the north want to be landed at King's College with no means of going further south, and only the narrow Fleet Street or Strand to conduct them either to the east or to the west?

4. No future bridge could assist the street where proposed, for it would be against all ideas, both of architectural beauty or economy, to erect a second bridge and its accompanying approaches so close to Waterloo Bridge. In the first place, because this would completely hem in the river front of Somerset House; and secondly, because Waterloo Bridge itself and its approaches can be economically doubled in width.

5. For the same reason the position is not the best for facilitating approach to the northern railway termini, for which purpose the street has been to a great extent advocated.

6. As to the advantage of the proposed site for opening out our public buildings, I venture to think it could not be worse. Our law courts, our bankruptcy buildings and King's College Hospital are all three much-frequented public buildings, at present placed in most crowded and inconvenient positions. One cannot conceive a more splendid opportunity than is here possible of opening out these three important buildings. Properly planned, a new street of less than a quarter of a mile in length would make all three buildings easy of approach from the whole of the north and north-west of London, and would bring out their architecture in bold relief. Instead of this the plan proposed merely brings out the flank view of a church,

intended by its architect only to be viewed as at present on its charming western front, while the main street will not open out any important public building at all.

The subject I have attempted to put before you to-night is so great and so important to us all that I fear it would be impossible for anyone to handle it with the fulness, force and clearness it deserves in the short time at our disposal. My own presentment of it appears poor and weak compared with what I should like to make it, and with what it ought to be made. I know of no subject that should appeal to us architects more forcibly than the architectural well-being of the city in which we live, and probably in common with you all I feel that the present condition of London is the subject of just reproach to our profession. It is not unreasonable that public opinion should expect of us some active steps, and I venture to urge upon you that it is our duty not to sit idly by and lament over the condition of our capital, but to take some vigorous and determined steps for its regeneration.

The measures which I propose to you to-night are simple. I ask you merely to give the official endorsement of this Institute to the opinion, held I think I may say by all who have studied the subject, that the only satisfactory way of making the streets of London adequate to our necessities and of improving its health and beauty, is by formulating a settled scheme of improvement and by gradually and steadily carrying that scheme into execution. I have endeavoured to show that most of the attempts at street improvements made during the past have been but spasmodic and feeble, compared with what might have been done and with what may still be done if such a plan be adopted. Fortunately, however, this has not been wholly so. Those cases where the improvement has been most successful are striking examples of the success of the method I advocate. We all know, almost every Londoner knows, that the gradual rebuilding of a part of London has been effected by the Duke of Westminster with unquestioned success; but it is not so generally known that these improvements have been carried out on a settled plan, and almost automatically, very much in the manner described in this paper. Lord Cadogan has also improved his London property in the same way, and thus have these great landlords shown us an example worthy to be followed.

The immediate practical step I think this Institute should take is to represent to the London County Council, our municipal authority, the imperative necessity of preparing a plan and formulating such a scheme as will be worthy of the greatest city in the world. If the Institute put these views adequately and forcibly forward I think the Council will not be found wanting. In the brief space that has passed since it has been created the Council has given many indications of a statesman-like interest in our welfare, and its work is beginning to kindle in our midst a faint spark of that municipal spirit which, in my belief, is absolutely essential to the carrying out of great municipal works. It may be truly said of the Council, "By their works ye shall know them," and perhaps it could do nothing so calculated to create a municipal spirit and to earn for itself an enduring fame as to boldly attempt the regeneration of London. The Council's predecessors failed in gaining our affection and esteem mainly from their lack of enterprise in this very direction, for their conceptions had neither grandeur nor comprehensiveness. Above all things, therefore, let not the magnitude of the work nor the fear of the cost deter us, for improvements never need be carried out at such a speed as to be an undue burden—indeed, I am fully persuaded the work need not prove a burden at all, but a blessing to the whole metropolis.

THE LONDON COUNTY COUNCIL AND TECHNICAL EDUCATION.

WE gave last week an abstract of the report by Mr. Llewellyn Smith, the secretary of the special committee appointed to consider what action the London County Council should take under the Technical Instruction Acts, 1889-91, and the Local Taxation (Customs and Excise) Act, 1890. In their observations on the report, the committee observe that while it shows that excellent work is being done in different parts of London, it also reveals how seriously the existing provision for technical education falls below the standard of Birmingham or Manchester. London contains a larger artisan population than any city, but its skilled traders are being largely recruited from the provinces, while Londoners, from lack of proper training swell the ranks of the unskilled labourers or of the unemployed.

Perhaps the most serious deficiency is the inadequate provision for evening instruction. About 100,000 children leave the London elementary schools every year, nearly all of whom ought to be found in the various evening institutions for the three or four next years of their lives. London ought, therefore, to have (besides adults) 300,000 or 400,000 boys and girls in its evening classes. Yet the total number of persons of all

ages attending evening classes in London in any branch of science, art or technology appears to be under 20,000, of whom 1,400 are in the evening classes under the School Board. Still more striking are the statistics for particular trades. In 1891 there were about 25,000 bricklayers within the county, of whom nearly 3,000 were under 20. The number receiving instruction in brickcutting was about 50; in the principles of brick-laying only about 40. The total number of operatives in all the building trades was about 140,000, of whom 15,000 were under 20; yet the number who were attending classes on the subject of building construction and drawing was less than 800. About 30,000 men and boys are at work in London in the printing and lithographic industries; only 140 of these were in 1891 getting any kind of technical instruction connected with their work. London has about 46,000 workers in the cabinet-making and upholstery trades, of whom 7,000 are under 20. The total number who were last year receiving technical instruction in their craft was under 120. Only three out of the 10,000 persons employed in London tanneries and only ten of its colour-workers were learning any branch of chemistry.

In view of the facts disclosed by Mr. Smith's report the committee recommend that the London County Council should resolve:—That, in view of the importance of London not falling behind other cities in the provision of technical education, it is desirable that the Council should exercise its powers under the Technical Instruction Acts, 1889 and 1891, other than that of raising a rate, by devoting to technical education some portion of the funds from time to time receivable under the Local Taxation (Customs and Excise) Act, 1890.

If the Council adopts the foregoing resolution some arrangement must be made for carrying out the very extensive work of considering the needs of every district, the claims of the various educational institutions and the manner in which their action can best be co-ordinated and supplemented. The committee recommend the appointment of a composite committee for this purpose, which might be called the Technical Education Board, whose chief function will be the evolution of some kind of systematic organisation. The possibility should be kept in view of the Board's being hereafter entrusted with funds from other sources, both public and private.

There remains the question of the amount of money to be devoted by the Council to technical education. If this were to be decided solely by the amount required for a really adequate provision for all branches of technical education, the sum would far exceed the limit of the Council's powers. Even to bring London up to the level of Manchester or Birmingham will require the expenditure of many hundreds of thousands of pounds. But it is obvious that the bulk of this expenditure must come from other sources than the county fund. What is now necessary is that such a sum should be appropriated as will provide for the most pressing needs and enable a beginning to be made in the work, to be ultimately completed with other aid. After careful consideration of Mr. Smith's report, the committee have come to the conclusion that, in order to deal fairly with all districts and provide for the more necessary subjects, a sum of about 60,000*l.*, in addition to the 30,000*l.* already set aside, should be appropriated to technical education for the ensuing year. This would involve the devotion to this purpose of about one-third of the funds receivable by the Council under the Local Taxation (Customs and Excise) Act, 1890.

CHURCH HALLS, EDINBURGH.

IT has now been decided to proceed with the erection of new church halls in connection with St. Cuthbert's Church on the site of the old manse buildings, and adjoining the site of the old halls in King's Stables Road, recently demolished in connection with the North British Railway extensions. The Kirk Session, on the recommendation of Mr. John Honeyman, A.R.S.A., architect, Glasgow, their assessor, have approved of the design submitted in competition by Messrs. McArthy & Watson, architects, 33 Castle Street, and the erection of the buildings is to be proceeded with at once. The site is an irregularly shaped triangle, and being below the level of the road the design required a special treatment. The building is placed lengthwise to King's Stables Road, and consists of two floors. The upper floor, which is approached from the level of the roadway by a broad terrace and a short flight of steps at the entrance door, is entirely occupied with the hall, which is seated to accommodate 800 adults. There are also suitable retiring-rooms. The lower floor is occupied with a smaller hall, class and retiring-rooms and caretaker's house. The heating and ventilating, and all the requirements for the public safety, have been very carefully considered. The exterior of the buildings is treated in the simple and dignified style of the Classic work of the last century as practised in this country. The cost of the buildings is 4,000*l.*

TESSERÆ.

"Breadth" in Art.

ONE of the most important requisites of chiaroscuro is a quality technically termed breadth. If there be a number of spots, either of light or dark, in a picture, or if a statue or a building appear to be cut up into a number of small parts, they are said to be deficient in breadth. There is nothing that conduces so much to the instantaneous impression on the mind, which is the great desideratum in art, as this quality. Nor does it only produce the first and striking effect in the work; but it also produces what, in technical language, is termed repose—that is, it allows the attention to be directed, quietly and at leisure, to the higher qualifications and less prominent beauties, and thereby enables the mind fully to appreciate the art exerted and the real power displayed by the artist in the expression of his subject. Breadth depends upon a just graduation of the lights and shadows in a picture. All lights should have some point more brilliant than the rest, and all shadows should have some heart, or deepest point, from whence they should graduate into the middle tint or general tone of the work. Pictures may be generally light, with a few dark objects relieved, as in Cuyp; in such cases they should not be of uniform darkness, but less dark at the outline than at some inner part. So, on the other hand, pictures may be generally dark with a few light objects in them, as in Rembrandt; here the light must be graduated in each object from some inner part to the outline. And, further, it is requisite, in pictures of these kinds, that the objects—whether, as in the first instance, dark against light, or, as in the second, light against dark—should be grouped together, if nearly equal in tone, and the intervening spaces between these objects in some degree assimilated by light or dark, so that the group of light or dark objects shall form a mass of light or shadow, in which there should be a nucleus of brilliancy or a heart of depth. Or one of the objects must decidedly predominate in light or dark, and the others must differ in quantity, as well as in degree, of light or darkness. Otherwise a spottiness will result, and the picture will be deficient in breadth and will want repose. Breadth in sculpture and in architecture is equally requisite, and is produced in the same manner: the details of a statue, group or building must be kept subordinate to the effect of the whole. In sculpture the markings of the muscles must not be so defined as to interfere with the unity of the trunk or limbs. In a group the vacuities between the figures should not be so apparent as to disunite what ought to be a connected whole. And in a building the openings, whether windows or doors, porticos or the projection of cornices which produce the general effect, should have such a variety and gradation as not to divide it into small or equal parts. But a very important point to be attended to is, that flatness should not be confounded with breadth: and, further, as pithily and forcibly observed by Fuseli, "that it were easy to have breadth if emptiness would give it." The parts should be there, and the general relief preserved; but in subordination to the effect of the whole work, whether of painting or sculpture.

The Burning of Rome under Nero.

Never did a city receive a greater permanent benefit from a transient calamity than Rome from the great conflagration in the reign of Nero. The extent, indeed, to which this destruction reached is not accurately recorded, though Tacitus assures us that three of the fourteen regions were utterly consumed and seven others more or less severely injured. The districts which he himself directly specifies refer chiefly to the hollow between the Cælian and Palatine, the valley of the Circus and the foot of the Esquiline. We may imagine that the flames, which ran from bench to bench the whole length of the Circus, would reach to the dense masses of building in the gorge of the Velabrum, and climb the adjacent hills, but we can hardly suppose that the temples and imperial mansion on the Palatine would be entirely consumed without special mention, still less that the ancient monuments of the Forum would be swept into the devouring abyss unrecorded. The Temple of Jupiter, on the Capitoline, seems undoubtedly to have escaped unscathed. Whatever limits, however, we may be disposed to place on the possible amplifications of our historian's rhetoric, there can be no doubt that a large portion of the city and some of the most thickly-crowded quarters were swept away, and reduced to a *tabula rasa* for the architectural fancies of the Emperor to disport upon. Nero seized the opportunity with his usual ardour. He had already revolved many schemes for effecting some great material construction which should render his name famous for ever. Now the time was come, and circumstances presented him with an object which, if worthily handled, could not fail to immortalise him. Nero had more of the Greek than the Roman in his character; more of the Oriental, the Macedonian Greek, than the purer and simpler Attic. He

resolved in his new constructions to emulate the great city-builders of Asia Minor and Syria; he rebuilt Rome after the fashion of Cæsarea or Antioch. Instead of the crooked, narrow streets of the old city, the result of the utter want of plan or systematic direction, which has been described, he laid out his new city in a regular network of straight and broad avenues, as far as the character of the site would admit of it; he widened the interior spaces of the blocks of houses, reduced their height and surrounded them with colonnades. He insisted that no houses should henceforth be built of wood only, but that all should have at least a basement of Alban or Sabine stone. Henceforth new Rome and old Rome were distinguished and contrasted with one another, and old-fashioned people continued fifty years later to sigh over their recollections of the ancient city, with its narrow streets and lofty houses, which intercepted the rays of the sun and retained the cool night air long into the morning. They might, at least, have been grateful for Nero's shady colonnades. We may imagine how large a portion of the population must have been displaced from the interior of Rome by this method of reconstruction. But Nero did much more than this. He had already connected the abode of his ancestors on the Palatine with the villa of Mæcenas, inherited by the Cæsars, on the Esquiline. A long bridge, arched and roofed in imitation perhaps of Caligula's viaduct to the Capitol, must have crossed the valley of the Colosseum to bring these two buildings into connection, and still leave open the necessary thoroughfares of the city. But he now determined to bring the two into closer union by the construction of vast buildings throughout the space between, so as to make one continuous series of halls and chambers, interrupted at least by courts and gardens only, from the summit of one hill to the other. The Golden House of Nero rose upon the area of a considerable portion of the city, including the slope of the Cælian and the Esquiline, as well as the whole summit of the Palatine, and crossing from one to another on long arched corridors. Again, the masses of the population were ousted from their ancient localities, and driven to perch themselves farther and farther from the centre of the city. As regards, indeed, the Golden House, it is true that a very few years saw the demolition of all the additions, at least, which Nero had made to the palace of his predecessors. A large part, however, of the space it occupied was certainly never restored for the inhabitation of the citizens. The Colosseum, so called, as is commonly said, from the Colossus of Nero, which adorned the vestibule of his palace, almost at the western entrance of the great amphitheatre, stands on ground which must once have been crowded with plebeian dwellings, and to this place of public resort were attached outbuildings, including reservoirs and fish-ponds, on the Cælian Hill. The Baths of Titus cover also a large area taken from the imperial residence, and transferred by the usurping dynasty to the people for their recreation.

Pendentive Domes.

The earliest specimen of pendentive domes is probably the little tomb in the Via Nomentana, at Rome, which, though probably of earlier date than the church of St. Nazario and Celso, carries out the pendentive principle to its full development, just as we see it treated at a later period in the double gate and the Golden Gate of the Temple area at Jerusalem, most probably erected under Justinian. All these domes are segmental in section. The pure form, however, of a pendentive dome—that is to say, the form in which the pendentives and the upper portion are really veritable parts of one and the same original dome, in the plan or base of which the rectilinear figure is inscribed—was not long adhered to. It was soon felt that the disc enclosed by the circular moulding looked flat and ineffective, and the idea early suggested itself of converting the circular moulding into a massive cornice, raising upon it a new dome of such proportions as should approve themselves to the eye, and allowing naught but the pendentive to remain of the original dome. No bolder idea was ever introduced in constructive architecture, for now the dome, instead of being, as at the Pantheon, supported firmly by a solid wall throughout every portion of its circumference, finds its conditions absolutely reversed; for in no portion of its circumference has it now a solid support, but all floats upon vacuity, suggesting the poetical similitude to Procopius that the dome of Sta Sophia appeared as if suspended by a chain from heaven. Pendentive domes in neither of their typical forms seem to have been frequently or customarily made use of in the more genuine Classic ages, though in modern times they have both been very wisely adopted into the revived Classic styles. They were, in fact, the special characteristic and the great glory of the Byzantine style. Mr. E. A. Freeman, on this subject, remarks:—"The offspring of the arch is the vault, and of the vault the cupola, and this majestic ornament is the very life and soul of Byzantine architecture, to which every other feature is subordinate. Its use had hitherto been mainly confined to circular buildings. To make it the central point of a Christian

temple was a grand and bold idea, and one which involved a complete revolution in the existing principles of architecture. . . . And not only did the grand cupola crown the whole pile, but the smaller portions are often covered with smaller domes and semi-domes. . . . The eye, habituated to the long naves . . . of our own great churches, is totally bewildered with so huge a pile, with apses and semi-domes 'sprouting out,' to use the expression of Mr. Hope, in every direction, and all circling round the vast central cupola like tributary rulers encircling an imperial throne." It is thought by some that the Byzantines borrowed the pendentive dome from Persia, but this seems insusceptible of proof; indeed, it exists of earlier age in Italy. It is more certain that, having once discovered its wonderful utility, it was communicated by them to every region to which their influence extended; and that, having been learned from them by the Mohammedans, it became the conspicuous feature of the architecture which extended continuously from the Bay of Bengal to the Atlantic.

Exactitude in Sculpture.

Exactitude of imitation is much more requisite in sculpture than in painting; but, nevertheless, even in this art, if it display itself in ostentatious trick or artifice, such as colouring statues to imitate life, it becomes offensive and disgusting to all experienced and intelligent persons; for such persons never look for deception, which they know to be mere trick, the pleasure of which ends with the surprise that it has once occasioned. To attempt to produce it, therefore, by mixing two separate arts, is to weaken the proper effects of both, as the trains of ideas which severally belong to each have arisen separately in the mind, and do not therefore readily or properly unite. The great sculptors of Greece, however, often composed one figure of different splendid materials, such as ivory and gold, marble and brass, &c.; but this was not for the purpose of any deception or greater exactitude of imitation, but to produce an imposing effect of splendour and magnificence in the ideal or allegorical images of supernatural beings. They also frequently made the eyes of silver, gems, or some other shining material, but never exactly to resemble the life, and certainly not for the purpose of deception, but merely to keep up that energy and vivacity of expression which characterised the other features, in which it could be exhibited in forms; whereas in the eyes it could only arise from brightness or colours. The effect is, accordingly, the most animated and striking that can be conceived in the instances which we have remaining of bronze statues with silver eyes, of which there are many, and some of exquisite work, but all of a small size. From these, nevertheless, we may form some ideas of the imposing and commanding effects which those of heroic or colossal dimensions must have had when exhibited as objects of devotion in the temples. Those of Phidias and Lysippus must have been sufficient to reconcile even a Jew or a Mohammedan to idolatry. Sculpture, being properly a simple imitation of form, does not seem intended to afford any merely sensual pleasure to the eye; for such pleasure can only arise from colour or variation of light and shadow, whereas sculpture, considered abstractly, has no colour, and the lights and shadows in which it most delights are regular, feeble, or harsh, so as to be always either too much or too little broken to suit painting, and therefore certainly not in themselves pleasing to the eye. Rembrandt laughed at those artists who talked of improving themselves in painting by studying the antique sculptures, and showed, as his cabinet of antiques, a room furnished with cloaks, hats, turbans, &c., of various stuffs and tissues. As a mere painter, whose object was to please the eye, Rembrandt was quite right; and, indeed, no man ever understood that branch of the imitative art better, or practised it with more delicacy and success, his works arriving nearer to abstract perfection, in what they pretend to, than those of any other modern artist in any branch of art.

Greek Love of Form.

In every fibre of their nature, beauty of form—in which they required that the effective and good should appear clothed—was felt to be so profound a necessity, that the Greeks required it not only in those mental productions whose peculiar province is the beautiful—in art, namely, with its various branches, as poetry, architecture, sculpture and painting—but in those also which especially thrive after cognition—science, with its several appearances, history, philosophy and physics. Nay, even in oral discourse on strictly practical concerns, whether of the State or of individuals, the charm of beauty could not be dispensed with: hence the high perfection of their oratory. But this spiritual craving of the Hellenes for beauty of form could have been excited only by an uncommonly vivid sense, nor could have been gratified without a quite peculiar aptitude for the plastic development of it; and, in fact, we know of no other nation endowed with both gifts so largely as they were. The earliest evidences of this inclination towards beauty of form appear in the religious lessons of Orpheus and Musæus; of which, indeed, no remains have come down to us,

but concerning which, at least, we certainly know that they were expounded in verse, thus early appearing in an artistic form with tendencies towards beauty. How early, too, the Hellenes had arrived at the development of this beauty in speech is proved by the high perfection of the hexameters of Homer, who lived a thousand years before our era; from which may be decisively inferred a longer previous use of that measure. We see the talent for beauty in plastic arts already showing itself above five hundred years before their entire perfection, in the admiration of beauty in individual men, and in the high estimation which it receives in the poems of Homer. In this respect there is a very characteristic passage in the 2nd canto of the "Iliad," where it is said of Nireus, in the catalogue of the ships:—"Nireus, in form (the faultless son of Peleus sole exempt), fairest proportioned of the sons of Greece: but he was heartless and his men were few." The Greek disposition is here strongly marked by the circumstance that, although he is allowed one element of that highest aim of Hellenic endeavour, beauty, namely, in the fullest measure, there instantly follows the remark that he was wanting in the other element, excellence of character. Now, the reason why Achilles, by Homer and all the Greeks, was extolled as the principal hero, was his possessing both these properties in the highest degree; on which account, too, Homer distinguishes him alone by the epithet, the faultless. Still, how well the Greeks could nevertheless appreciate spiritual worth, even when quite destitute of beauty, there needs no more striking proof than the boundless reverence paid by the first men of his time to Socrates, the noblest and purest incorporation of character, although his exterior presented the sharpest contrast to the so-called Grecian ideal. As for the worship of beauty peculiar to the Greeks, it might be further proved by many examples. On the occasion of the Battle of Plataea, where the very existence of all Greece was at stake, Herodotus does not fail to notice that the Spartan Kakicrates was "the most beautiful of all in the Greek army," not of the Lacedæmonians alone, but of all the other Hellenes as well. In Æginus, an Achaian city, Pausanias tells us, where there was an image of Zeus in the age of boyhood, they used in ancient times always to choose for his priest the most beautiful stripling that could be found there.

The Inscriptions in the Beauchamp Tower.

Most of these inscriptions were made by men of whom no other trace is left. Like the beings of an older order of creation, they have completely passed away, a few marks in the granite alone remaining to tell the brief story of their lives. Yet, read by the light of such memorials as Fisher and Howard have left behind, how full of saddest eloquence they seem. How strangely laden with a sense of desolation, of heart-weariness, of abandoned hope, are those rudely-cut old Italian words in the shield on the right hand of the first recess in the wall:—"Dispoi: che: vole: la: fortuna: che: la: mea: speranza: va: al: vento: pianga: ho: volio: il: tempo: perdudo: e: semper: stel: mea: tristo: e: disconteto:" which may be thus rendered into English:—"Since Fortune has scattered all my hopes to the winds, I wish that Time itself were no more, my star being ever sad and unpropitious." The signature appended to these words is "Willm. Tyrrel, 1541." But history has left us no clue to the person or crime of any so named. Fancy will picture him in various guises. From the genuine agony of his utterance one could readily believe he was lying at the time under sentence of death. Another unknown, of the name of William Rame, has left his wisdom printed on the wall under date 1559, in the following pious proverbs:—"Better is it to be in the house of mourning than in the house of banqueting. It is better to have some chastening than over much liberty. There is a time for all things—a time to be born and a time to die, and the day of death is better than the day of birth. There is an end of all things, and the end of a thing is better than the beginning. Be wise and patient in trouble, for wisdom defendeth as well as money. Use well the time of prosperity, and remember the time of misfortune." These lessons are among the commonplaces of our great store of verbal wisdom, but no one can read them on the stones of Beauchamp Tower as commonplace. They seem to come like drops of blood distilled from a lacerated heart. In the third recess part of an inscription runs thus:—"Unhappy is that man whose acts doth procure the misery of this house, in prison to endure. 1576. Thomas Clarke." Who was Thomas Clarke? No one knows. Under it we read:—"Thomas Miagh, which lieth here alone, that faine would from hence begone." And the verse goes on to say that he has been put to the rack in vain, but is still kept a close prisoner. An inscription, consisting of a pair of scales and the following words, catches the eye:—"1585. Thomas Bawdewin, Juli. As virtue maketh live, so sin causeth death." These men have sent their names down to posterity, but nothing more. In everything else they have perished, and the memory of their offences with them, as entirely as if they had never lived and provoked the jealousy of this world's rulers.

NOTES AND COMMENTS.

PLANS have been prepared by Mr. BRYDON for technical schools which are to be erected on the site of the White Lion Hotel in Bath. The accommodation provided is as follows:—Basement—workshops for engineering, carpentering, plumbing, coachbuilding, &c.; also mechanics' laboratory, engine-house for the shafting, heating chamber, and boiler-house for hot water. Ground floor—large lecture-room to seat 240, with preparation-room adjoining, small lecture-room to seat 100, library and museum, and the superintendent's room. First floor—the art classrooms, comprising modelling, elementary, advanced and life classes, besides three general classrooms and the art master's room. Second floor—Large laboratory for chemistry and physics, one laundry and two cookery classrooms, and two general classrooms. Cloak-rooms and lavatories for men and women are provided on the basement, ground and first floor. The architect's estimate of cost of building is 18,500*l.*, to which must be added commission 925*l.*, furniture and lighting 2,000*l.*, contingencies 1,000*l.*, making in all 22,425*l.* A sum of about 5,400*l.* is available, and it is proposed to borrow 17,000*l.* at 3½ per cent. The Municipal Buildings Committee are about to have the quantities for the new building taken out and to advertise for tenders.

If Bath deserves to be described as "that beautiful city which charms even eyes familiar with the masterpieces of BRAMANTE and PALLADIO," to employ MACAULAY's words, the credit is due to the two WOODS. Little is known about them. In 1722, JOHN WOOD commenced practice in Bath, and although he died in his fiftieth year, he left many memorials of his ability, not only in single buildings, terraces and crescents, but also by his skilful planning of the streets. A lecture has been given in Bath by Mr. R. E. PEACH on "The Two Woods and the Bath Renaissance," but he was not able to impart much information about the architects. He said that the elder WOOD began his grand work in 1722 within a few yards of where they were assembled that evening. Both father and son had lived in the same house at Batheaston, and there they died—the father in 1754 and the son in 1781. In conclusion, Mr. PEACH said "both were men who, taking them all in all, we shall never look upon their like again in this city, which they made." Mr. PEACH promised to enter more fully into the subject on another occasion, and it is to be hoped inquiry in Bath will enable him to dispel the obscurity which surrounds two most able architects who lived and worked little more than a century ago.

In an address to the Shropshire Archæological Society, Mr. A. P. HEYWOOD LONSDALE gave some curious information about his Shavington Estate, which reveals the kind of peace which used to prevail in country districts. The original name, as given in Domesday, was "Savintone." So early as 1292, "Shavinton," "Schavynton" and "Schavyngton" appear in deeds. There was a curious tenure in connection with the spring which furnished water to the large pool in Shavington, and for which an annual rent had to be paid with an arrow barbed with peacock's feathers. Shavington was bought in 1461 by Sir JOHN NEDHAM (as the name was then spelt), his successor being WILLIAM, who was enfeoffed in 1843. One of the successors was created, in 1625, Viscount KILMOREY, and in his time arose difficulties about the tenure with his neighbours, the CORBETS of Adderley. A sort of family feud continued in reference to the agreement of Sir ROBERT NEEDHAM, in 1556, with Sir ROWLAND HILL (the then owner of Adderley) to hold the manor of Shavington of the lord of the manor of Adderley at the eighth part of a knight's service and 12*s.* 6*d.* annual rent, which was finally confirmed by legal decree in 1610. Another cause of dispute was in regard to the accommodation in the parish church of Adderley, where the CORBETS occupied the chancel as patrons, and where the NEEDHAMS had to be content with seats in the rector's pew. Viscount KILMOREY then, with the approval of the bishop, built an aisle or transept on the north side of the church for the use of his family, and this caused further discord between the rival magnates, and on one occasion Sir JOHN CORBET had his Irish footboy buried in the KILMOREY vault, over the body of the late Viscount.

This proceeding naturally gave great offence, and the Earl Marshal was petitioned in the matter, and ordered CORBET to remove the body. On one occasion a free fight between the retainers of the two families took place in the church. Another bone of contention was the road from Shavington to the church, which passed through two fields belonging to the CORBETS. Here it was merely a cart-track, and Sir JOHN CORBET refused to keep it in repair. This also was the cause of a lawsuit, which dragged on interminably, and the road was never repaired. The last Lord KILMOREY, with dry humour, set up a notice-board inscribed, "This road is impassable, not even jackassable; Who on it would travel must bring his own gravel." The Shavington Estate now comprises the historic property of Ightfield, which still retains its moated residence. The house is small, but prior to 1579 was smaller still.

THE report of the Glasgow Institute of the Fine Arts, which was read at the general meeting on Saturday, was more satisfactory than the reports of late years. Hitherto the Institute has not paid expenses and interest on capital. But as the four shops which are on the street level have been altered, a higher rent will be charged, and instead of 700*l.* a year 1,000*l.* will in a short time be derived from them. The exhibition galleries are becoming more sought after for meetings, bazaars, &c. Last year's exhibition produced an increase of 260*l.* over the receipts of the preceding exhibition. The value of pictures sold was 3,923*l.* 10*s.* Among the year's expenses were law costs amounting to 300*l.* It appears the property was originally held by four members, two of whom had died. The Council considered the arrangement was irregular, and to rectify it and obtain a proper title it was necessary to pay 300*l.* to lawyers. According to the report the present state of the membership is as follows:—Contributors of 25*l.*, 30; contributors of 10*l.*, 623; contributors of 5*l.*, 45—a total of 698, of whom 25 have been elected since last report. Of the members, 5 are lady members and 91 artists. The members have every reason to look forward with confidence to the future of the Institute.

MEISSONIER is still a name to conjure with in France, for the price of admission to the approaching exhibition of a selection from his works on the opening day, which is March 6, will be 100 francs, or 4*l.* It is true that those who are willing to pay that sum can have a season ticket, but probably few will avail themselves of the right to visit the exhibition when the price is moderate. The receipts will be divided among three charitable institutions, viz. a Night Asylum, Aid to Victims of Duty, and the Orphanage of the Arts. Already there are eleven hundred works arranged to be shown, but it is not to be supposed that they are all elaborate paintings on a miniature scale, for included in the number are sketches and studies which M. MEISSONIER jealously guarded from the public or critics. It is anticipated that a large sum will be obtained. After the exhibition some of the works will be sold by auction.

To some archæologists Heliopolis sounds as sweetly as Mesopotamia to people of a different class. It is no wonder, for APOLLO delivered his oracles there. Accordingly it will be generally gratifying to know that Heliopolis is at last about to yield some of its secrets, and the value of the wisdom of its sages may soon be tested in village schools. It appears that the Duc DE DINO obtained authority to explore a site which was supposed to be part of the sacred necropolis of Heliopolis. The operations were directed by M. PHILIP. Already most satisfactory results have been obtained. M. GREBAUT, who was associated with the museum at Ghizeh, has visited the works, and according to him there is no doubt that the excavators have opened the necropolis, which was of an immense area. Heliopolis was one of the most famous of the Egyptian cities, and, says HERODOTUS, "the Heliopolitans are esteemed the wisest of all Egyptians." The Greek historian was afraid to express their theological discourses; but there is nothing sacred to a modern sapper or *savant*, and if the tombs can furnish knowledge, the whole world will soon know of it. If the French will confine themselves, like the Duc DE DINO, to archæological investigations, the English will have no jealousy about their stay in Egypt.

FOREIGN architects who visit the City express surprise to see so many excellent buildings in out of the way places. But as London is not planned like their cities, there is no avoiding the drawback which prevents such a building as Mr. ROBERTS'S from being more generally known. The illustration is from a photograph by Messrs. BEDFORD LEMERE & CO.

HAMSTEAD SYNAGOGUE.

THIS synagogue is situated in Dennington Park Road, West Hampstead, on the site of Laurieston Lodge, and was erected to meet the needs of the many Jewish families residing in that growing district. The building would have been placed in West End Lane but for the need of obtaining an eastward aspect for the ark.

The façade is carried out in red brick and red stone, the small amount of detail being Romanesque in character. The leading feature of the external design is the main tower, which is an uncommon feature in synagogue designs, and which is a conspicuous object for a considerable distance. This tower contains on the ground floor the main hall; on either side in the subsidiary buildings are the vestibules, which lead to the gallery staircases, enclosed in small wings constituting the end features of the principal elevation.

The main building is octagonal on plan, and in that respect differs from any other synagogue in London. At the corners of the inner octagon are columns carrying the galleries, which occupy the space between the inner and outer octagons, the columns leading up to a dome of great height. The rake of the gallery is exceptionally steep, in order to give a uniformly good line of sight.

The Continental system of grouping the ark, the reader's platform and the pulpit at one end of the building is here adopted for the first time in London. Behind the ark, obscured by wrought-iron grilles, is the choir. The inside of the building is finished throughout in pure white.

The seating capacity, when all the benches are in position, is 700 sittings. Each seat has a rising flap, with box underneath for prayer-books, and each seat has a hinged book-flap in front. There are seven entrances to the building on the ground floor, the principal entrances being through two pairs of double swing-doors in lobbies, to prevent draughts. The lighting is effected by a sunburner of 171 lights, and by standards and brackets. The heating is a combined hot-air and hot-water system. An ample system of ventilation is provided.

The general contractors were Messrs. JOHN ALLEN & SONS, of Palmerston Works, Kilburn; and the architect is Mr. DELISSA JOSEPH, F.R.I.B.A., of 17 and 18 Basinghall Street.

THE ORIGIN OF BUILDING.*

(Concluded from page 88.)

A NOTABLE building in Rome is the Coliseum, the great Roman circus, a part only of the outer shell remaining. The storeys of broad stone arches are here seen, each storey of slightly diminishing proportions as they ascend, and the whole crowned by a tall balcony. This building is a combination of four styles of architecture, at least in the columns introduced between the arches. On the ground storey the columns are Doric, on the second Ionic, on the third Corinthian, and on the fourth a combination again, which the Romans invented, of Corinthian and Ionic, called the Composite and Roman order. As to the interior, you will notice the statues, the idea of which the Romans brought from Greece, and introduced into their buildings in a different way. It has been a circus or amphitheatre, wherein some of the most bloody and cruel scenes have been enacted; it has also been a fortress and a hospital, a stone quarry, and barely escaped being turned into a woollen manufactory. In 1750 it was consecrated to the Christian

Martyrs. It is now a ruin. It was probably completed eighty years after Christ, and would hold about 100,000 spectators.

The Romans were road-builders, founders of walled cities and conquerors, and the triumphal arch or gateway marked at times the "completion of a road," the "construction of a bridge," the "entrance to a city," and, beyond all, "the arch under which passed the victorious army after a successful campaign." The triumphal procession marched along the Tiber, and passed down the Via Sacra into the Forum of Trajan, in the heart of the city. Along this Via Sacra were constructed the various triumphal arches. The first was erected by Titus, another by Severus, and Constantine also erected one. The three exhibit different styles of development, the one by Constantine being the most perfect, and is here shown. The style is Roman Composite, combining the Greek, Corinthian and Ionic.

We have here a view of the Basilica of Constantine. It is necessary to explain the cause of the new departure in architecture at the time the building was founded. An improvement (or otherwise) in art has invariably been caused by some great change in the religion or the policy of nations, and so we find it at this time. From 117 A.D. to 306 A.D. art, with a few exceptions, was not flourishing. We find the fourth century ushering in a new epoch in religion and architecture, the one having great influence upon the other. The Christians at Rome, who had previously been fearfully persecuted (and what buildings they had had been destroyed), were now permitted to openly avow their creed, and we find in 324 Constantine—who, if he had not embraced Christianity, was favourable to its followers—altering the laws, and ordering that the churches that had been demolished during the previous reigns should be rebuilt, and the property of the Christian church restored. He exempted the Christian clergy from personal taxes, and granted donations and privileges to the churches.

The Christian religion may be said to have rendered a most essential service to the arts, and contributed to the revival of the genius of the architects. All the remains worth retaining from the ruins of many of the ancient Roman basilicas (or open unroofed halls of justice) were re-used and embodied in the buildings they erected at this time for religious purposes, and have by this means been preserved. With these columns and arches taken from old times the Christians erected their places of worship, which, although closely related to the Pagan Roman style, still has a distinct style of its own.

We have now come to the view which I wish to compare with the most elaborate and latest of the Pagan Roman style. It is that of San Paolo at Rome. The contrast is most remarkable. Starting with the roof, this one is flat and of wood. The walls, again, do not rest upon massive piers, but are carried by the columns, which, instead of standing out from the walls in front as an ornament or to assist only to carry the roof, are here brought under the walls, and are made, with the arches from column to column, to support the whole. Again, we notice the absence of the cornice and entablature over the columns. On each side of these rows of columns there is an aisle with a lower roof than the main roof, which is formed, therefore, into a clerestory, from which windows for light are obtained. The general lavishness of enrichment has disappeared. By the arrangement of the columns directly under the arches, and the omission of the entablature, we have a new architectural element—the Latin or Italian arcade. The further end of San Paolo, you will notice, terminates in a semi-circular half-dome, the entrance to it forming an arch. This is all that remains of the "arch," "vault" and "dome," as in the Pagan Classic. The Christians called it their triumphal arch, and over it always appeared a representation of the Saviour. San Paolo was burned down in 1823, but such was the veneration in which it was held, that it was rebuilt, as nearly as ever possible, after the original design.

It is well known that the Roman Empire began to decline in the commencement of the fourth century A.D., and the Emperor Constantine, who had hitherto, when at peace, resided at Rome, transferred the capital from Rome to Constantinople, or Byzantium, as it was then called, and attempted to make it rival Rome itself in monumental grandeur by erecting immense public buildings. Constantine built a cathedral, dedicated to St. Sophia, and a church to the Apostles. The Latin style of the early Christians now, upon the removal of the capital from Rome, developed into a more decided style, called after the new capital Byzantine, and one of the best specimens is the cathedral of St. Sophia, Constantinople. The cathedral built by Constantine was destroyed by fire, and the one erected soon after by Justinian, in the year 532, was completed in sixty years. The Emperor Justinian, in his admiration of his magnificent edifice, is said to have exclaimed, "I have vanquished thee, O Solomon!" and almost with justice could he glorify himself, for the dome of St. Sophia is the largest carried on piers in the world.

It is exceedingly difficult to draw the line between the Byzantine and the Romanesque styles, and indeed some authorities decline to draw the line, and link them together as "Byzantine and Romanesque," although the true examples of

* *The Origin of Building: Its Progress and Development. A Non-technical Review of the World's Architecture.* A lecture by Mr. Howell J. Williams, read at Anderton's Hotel on Thursday, February 2, before the members of the Olavian Society.

each are separated by several centuries. There is a connecting link, however, in the cathedral at Pisa between the Latin, Byzantine and Romanesque, combining all three. Here we have the cathedral, the baptistery, and the leaning tower. You will observe from the exterior of the cathedral that the structure is called a cathedral out of compliment, as it were, it being but little higher than the early Christian basilicas; but the two additional storeys just save its dignity, and the edifice being of white marble, is described as being exquisitely beautiful, presenting the appearance of lacework. I think the peculiar leaning tower is worthy to have a few remarks concerning it. A remarkable circumstance in this tower is that the top overhangs the base upwards of 13 feet, giving it the leaning appearance observed. This peculiarity is also observable in several other Italian belfries. It is due to defective foundations. There is conclusive evidence that the failure exhibited itself before the building was completed, for on one side the columns were built higher than on the other, and to this the building doubtless owes its preservation. We are better builders now, though—at least, in this respect, the care taken in the foundations of a large building being, as a rule, greater than that bestowed upon any other portion. And a very good thing too; and I am sure you will agree that if any scamping is to be done at all, it ought never to be done in the foundations.

Before continuing the styles direct onwards to the Romanesque, which ought to be the next link, I think we might turn aside for a few moments just to have a peep at the Moorish or Saracenic style, which is perhaps as interesting, or even more so, than any of the others, and the history of architecture would be incomplete without it. This once-powerful race conquered a great portion of the East and the Holy Land. Here they erected a mosque. This mosque is that built by Omar at Jerusalem, and is supposed to have been the first of their erections outside the limits of Arabia. It has been added to from time to time. The Moors, passing from the East along the north of Africa, crossed over and conquered a greater part of Spain in 780, and the earliest example of their erections there is the Mosque of Cordova, which was finished in 794. The style of this building, although still being remarkably Moorish, was with very little doubt copied from those then existing in the East. The interior presents an appearance of a forest of columns, composed of jasper and other marbles, and they bear a strong resemblance, I think, to the Corinthian and Composite styles. After the reconquest of the city by San Ferdinand in 1238 the mosque was converted into a cathedral. The most perfect example existing, however, of the extent to which sumptuousness of ornament and enrichment can be carried is to be found in the Alhambra, the residence of the Moorish kings of Granada, erected between the years 1240-1348. In this building there are, indeed, no traces of art peculiar to any other nation, and the composition and distribution of the ornamentation are arranged with rare skill. The Alhambra was a palace within a fortress. The great fortified height overlooking Granada is shaped something like the Acropolis at Athens. The palace itself resembles those of ancient Rome in the respect that it consists of two courts surrounded by various apartments, all upon the ground floor (the Orientals and Arabs are rather lazy, you know, and don't like stairs). One of the courts is called the Court of the Lions. The lions are seen carrying the fountains. The Court of Lions led up to the gate or entrance to the Hall of Justice. But it would be an injustice for me to attempt a short description beyond what I have given of this model of pure Arabesque architecture, as a very poor notion would be conveyed of the splendid work it contains. I need, therefore, only add this—that every part of the walls and ceilings is covered with a mass of ornament, enriched with gold, giving very great evidence of the high degree of refinement and luxury the Moors had attained previous to their overthrow.

We now come to the Romanesque style, which should have followed the Byzantine, only we turned aside first to visit the Alhambra. Of the Romanesque there are several sorts—Italian, German, Norman and Norman-English. It flourished in the eleventh and twelfth centuries—the era of the Crusades and cathedral building, and it may also be regarded as beginning a new era in the history of Europe. One of the first examples is Milan Cathedral, although not the best or the most decided in style, it being in a great degree Gothic. The Romanesque has all the elements of the Gothic, and some authorities even call it Round Gothic—rather a shock to those who cannot associate Gothic with any other than pointed windows; but it is not a window alone that constitutes a style. The chief features of the Romanesque are a few large round principal windows, with mullions and reveals surrounded by a number of slight clustered Gothic columns, and a number of small loophole slits for light generally, then great spaces of massive dead wall relieved by buttresses, a vaulted roof of stone (not a dome) on heavy piers or clustered columns. The interior of Milan Cathedral is a better example of the style than the exterior, though still mixing up the Pointed Gothic,

and not so beautiful and scarcely equal to it. This is, however, sufficient to show what is meant by vaulted roofing. The original cathedral was built in the year 900, and almost entirely rebuilt in the twelfth century. The principal specimens of the Romanesque order are, however, found in Germany, some also in France. Those in Germany are the cathedrals of Spire, Mayence and Worms. In the eighth century the north of Europe was brought into close contact with the south and east by the conquests of Charlemagne, who afterwards erected in different parts of his extensive dominions many grand buildings dedicated to Christianity, and naturally carrying the arts and architecture of Italy to the northern parts of Europe, and combining them with their own heavy style, formed the Romanesque. One example is the cathedral of Mayence. The German princes laid claim to being called Emperors of Rome, and their great ambition was to build in the Roman manner, that is, with vaulted roofs, and this with the most imperishable of material, stone, and it was a great triumph when their great cathedrals were successfully vaulted over. The cathedral of Mayence was commenced in the tenth and finished in the eleventh centuries. That of Worms was commenced in 1016, and added to in the twelfth, fourteenth and fifteenth centuries. I do not like to omit from the list of views the cathedral of St. Mark's, Venice; but time will not permit me to dwell upon the history of this most beautiful building, which is really deserving of a lecture on its own account, and I will simply add that it may be regarded possibly as a connecting link of the Romanesque, Byzantine and Gothic.

We now come to the style of architecture best known (at the present day, at least) in England—the Gothic. It is extremely difficult to fix upon the commencement of this style of architecture. It is well known and accepted that the strict Gothic characteristics are pointed arches, pointed and flying buttresses and pointed everything, also an immensity of geometrical tracery in windows and on ceilings. The pointed arch was used by the very early Pelasgians in their rough way, and was used by the Moors and Indians, and the Chinese have something of the kind. This style was abandoned until the Middle Ages, but it was then, however, taken up with increased vigour at a time when the Goths were, more or less, a great influence in Europe. The view on the screen is the exterior of Notre Dame, Paris, a noble specimen of Gothic architecture. The Gothic style appears to have been adopted by Western architects (there are no true Gothic buildings in the East, at least not that I am aware of) in the eleventh, twelfth and thirteenth centuries, several rare edifices being erected, in which it was more marked in the lower part of the building than the upper, on account of the pointed arch being considered to present more resistance in supporting the superstructure. From this use (which is very noticeable in this cathedral), first originating in the demand and care for solidity, it was extended equally to all parts of a building. By comparing the elevation (that is, the view of a building obtained by looking direct at it) or upright appearance of Notre Dame with that, say, of Pisa or San Paolo, which you may remember we had just now, the difference and the change from a basilican form to a cathedral form is very clearly seen. Notre Dame is one of the oldest Gothic churches in France, commenced 1163. It is ornamented with 1,200 statues. In great contrast to Notre Dame, Cologne Cathedral may be taken as the type of the Decorated Gothic and the finest of the Gothic cathedrals.

I feel it would be undesirable for me to go into anything like a technical analysis of the details of these buildings, as none but those in the profession would understand the terms, but in producing the buildings as a whole before us we are able to comprehend clearly from optical observation the difference in the various styles, from the Greek temple to the Christian cathedral. Cologne Cathedral was commenced in 1241, and left only partially built with a temporary roof in 1500, and it remained in that state until 1830, when the original plan was continued until the building was completed as shown.

Gothic buildings became very general throughout Europe, but each nation has added characteristics of its own. It is principally used for ecclesiastical erections, but private and public buildings, mansions and palaces, have been very successfully erected in this style. Just to show how the Gothic became stamped with the features of the land of its adoption, we have the cathedral at Florence, an example of Florentine architecture combined with Gothic. The chief thing missing, and differing from the previous examples you will notice, is the absence of buttresses, pinnacles, &c., and the profuse introduction of horizontal lines. The building was commenced in the twelfth century during the great Gothic rage. The whole of the exterior surface has a coating (in the Florentine manner) of black and white marble panels. The other view I feel I ought not to omit is the Ducal Palace at Venice.

By comparing this edifice with those of the north of Europe, it will be clearly seen how very different from our own is the Gothic of Italy. Here we have a magnificent example of Venetian Gothic. There are no compound piers, no buttresses,

no sharp gabled roofs. The only form of similarity is the distinctive feature of the pointed arch generally. The Ducal Palace resembles in a great degree an Oriental building, and you may remember my remarking that the Moors had had pointed arches, so that this palace forms another connecting link. It is a Saracenic building, except that it has not the Arabian ornament, the gorgeous coloured arabesque.

The walls above the arches are relieved from an appearance of heaviness by the diaper patterned marbles, beautifully coloured, which covers its surface. The architectural colours of Florence are black and white, those of Venice are rose and cream, and the atmosphere being so pure and clear they retain their cleanliness and colour. The idea of the arches and columns being at the bottom is that the building rises out of the water (Venice being built in the water on piles), and taken in connection with this fact it is correct, although otherwise it would not be. The building was commenced in 1350. There are many magnificent examples of Gothic architecture in England, but with these I may deal if there is time in a very short notice later on.

There is another style of the romantic class, and that is Renaissance, and this is chiefly to be found in France and parts of Italy, as an example, the Château de Fontainebleau. By some this style is called the square Gothic, and it may be described as the gradual transition or change from Gothic (which in the fourteenth century became practically not used) to Revived Classic, and I think the best example of Revived Classic is the cathedral of St. Peter's at Rome. St. Peter's exhibits a summary of the three greatest styles that preceded it, the old Roman, the Byzantine and the Gothic. The following are some of the special merits:—It has only two parts, a compact body and a dome. It is all taken in at a glance. A Gothic cathedral, with its many parts, is bewildering and difficult to grasp.

Unlike most of the other cathedrals, St. Peter's is fully finished both as to the exterior and the interior, which is decorated in white and gold. The style of columns, cornices and entablatures is rich Corinthian work in Roman manner, viz. a profusion of enrichment. There is a great similarity between St. Peter's and St. Paul's in London, especially in the interior, as Sir Christopher Wren designed St. Paul's upon the model of St. Peter's, adding a feature of his own, however, in the steeples or towers. The pavement of St. Peter's is marble, the walls are covered with mosaic, and the piers faced with marble slabs. The general roofing of St. Peter's is flat. The two most important buildings in the world for comparison are the Pantheon and St. Peter's, both in Rome. The one the Greek temple in style, the other the Roman dome. Every northern country in Europe has repeated the Roman dome and the Greek temple. In London, for instance, St. Paul's is the one style and the British Museum of the other. The one chief and most important building in the world is St. Peter's. It is built in the most civilised part of the world, Europe, and in Italy, the architectural garden spot of this continent, and by her grandest artists, Raphael and Michel Angelo, and as a Christian cathedral, never having been used for any other creed. As a monument of the Christian religion, St. Peter's is the standard. The other styles of Europe have their rivals in different parts of the world, but St. Peter's is far beyond rivalry.

I feel that the architecture and building of England should really be dealt with as a separate lecture, as it is obviously impossible for me to do justice to Great Britain in a short summary. I have, however, a very few views of the several styles adopted in England, and will place them quickly one after the other without going much into detail. The original style was doubtless the same in this country as elsewhere, coverings of twigs, huts, tents and caves, and the next step was the stonework at Stonehenge; all these we have already had before us in the Celtic, also the Roman. We, therefore, start with Anglo-Saxon. Here is a view of one of the first churches in England of the Anglo-Saxon period. The idolatrous creed of the Saxons gave them no inducement to improvement in building temples, and in 652 A.D., when the Christian religion had taken root, the churches were mostly built of wood and covered with reeds, which practice continued for some time afterwards. It was not until the later part of the seventh century that the art of building in stone was again practised in England. The remains of these are, however, most picturesque ruins.

One of the oldest, if not the oldest, of the abbeys of England is that of Bury St. Edmunds, founded by Canute in 1018. The next style is the Anglo-Norman, and one of the best examples I can place before you is the doorway of Malmesbury Abbey, founded in the twelfth century. The Norman style devoted great attention to their entrance doorways, receding them back and forming porches in the thickness of the walls.

Before passing to the decided English Gothic, we have a very curious view in Bedfordshire, the Priory Church, Dunstable, of a combination of the three styles, Saxon, Norman and Gothic, that from its very curiosity deserves

a place in this history. It was founded in the eleventh century upon a very grand plan, with a lofty tower in the centre, but it appears (from the elevation at least) to have been partly rebuilt at different periods, one portion over the other. The doorway seems from appearance to have been of very large dimensions, and to have been panelled in with a Gothic arch under the Norman one. Then surrounding the Norman we have the Gothic, evidently of thirteenth-century restoration, then a more refined Gothic, and again, when Gothic for a time lost its hold, we have in the towers and parapets a recurrence to the Early English battlemented style, a veritable history of England in stone and bricks and mortar. It was on the doors of this building that the proclamation of the divorce of Henry VIII. from Catharine of Aragon was nailed, she being at Amptill, and refusing to attend to hear it read.

The Gothic was introduced into England about the commencement of the thirteenth century, and is divided into three classes—Early English, Decorated, or Middle English and Perpendicular, or Later Pointed English, and the best example existing is Westminster Abbey, which combines all the styles of the Gothic in Edward the Confessor's Chapel, where we have the Early Pointed, and the interior from Poet's Corner Middle Pointed, and the best example of the Later Pointed is undoubtedly Henry VII.'s Chapel. This is the most elaborate of all, and the work is really magnificent and cannot be surpassed in Europe. There were, of course, other styles of architecture in vogue in England at the same period, as the Gothic, chiefly castellated and domestic, and the chief glories of these are of the period of the Tudor kings and Elizabeth, and to a certain extent we can claim them as the Welsh style. Gothic was no longer used in England, except perhaps a few of its features introduced here and there into buildings, and from the reigns of James I. to Charles II. two of the most noted architects that England has ever possessed, Inigo Jones and Sir Christopher Wren, have left some of the finest buildings of Mediæval times. Inigo Jones adopted chiefly the Italian Renaissance, and Christopher Wren Latin, Revived Classic; and one of his grandest works, St. Paul's Cathedral, I place on the screen, that we may compare it with its model, St. Peter's at Rome. The Italian and French Renaissance and the Revived Classic in some form or another has held its ground in England ever since, but some years ago there was a great rage for Revived Gothic, of which we have in the Houses of Parliament perhaps the finest pile of Gothic buildings (taken as a whole) in the world, designed by Sir Charles Barry. Gothic has ever since then been more or less in demand, many buildings of importance having been erected in this style.

THE ARCHITECTURAL ASSOCIATION.

AT the ordinary meeting of the Association held on Friday evening, the 27th ult., Mr. H. O. Cresswell, president, in the chair, the following gentlemen were elected members:—Messrs. H. W. H. Palmer, F. B. Chester, J. L. Lindlay and A. E. Hughes, jun.

Mr. F. T. W. GOLDSMITH, hon. sec., announced that the first sessional visit would be made on Saturday, February 11, to the church of St. Bartholomew the Great, Mr. Aston Webb having promised to conduct them over the works. The second visit would be on Saturday, February 25, to the new building for the Institute of Chartered Accountants, Mr. John Belcher architect.

Mr. SIDNEY VACHER read a paper. The following is an extract.

The Small Suburban House.

Mr. Vacher, who stated that the houses he wanted to consider would be those letting at annual rentals of 75% to 130%, or even 150%, said:—The suburban householder expects always three reception-rooms and the offices on the ground floor and four or more bedrooms on the first floor, with bath-room, dressing-room or rooms, and as many attic bedrooms as he can get. Generally for the reason I have stated the frontage is as narrow as possible; and when a particularly costly site occurs through being close to a railway station, and the town yet being quiet and secluded, and having a pleasant look-out on land that cannot or is not likely to be built on, semi-detached plans are useful. To plan a good house it is absolutely necessary to study the site, which will suggest and govern the arrangement of your rooms. And I think it wise to lay before myself a set of propositions and requirements that must be fulfilled before I can consider my plan satisfactory. You must not say this scheme is pretty, I think it will do, although you have not arranged space for a store-room, or the only place for the linen cupboard is in the attics, or there is no box-room or proper tank-room. Though these seem accessories, so much depends on them, and it is largely due to these rooms whether it is to be a comfortable house for a good housewife to live in, that they become of utmost importance.

The first requirement I think about the house is airiness'

and so sweetness, for, do what you will, in most houses it is next to impossible to prevent the smells from the kitchen pervading everywhere. On this account I much like the plan with a passage through the house from the front door to the back or garden door. In summer time the current of air through the house makes everything pleasant and nice, and as you come into the house, probably on the north side, and see through the garden-door the sunshine beyond you, and feel the cool air, you really imagine yourselves in the country. The plan I have in my mind is the usual two rooms one side of passage, and library on the other, with offices behind, and the entrance to them under the staircase. Though a common plan, it is capable of special treatment. I do not like a plan that simply delivers you into a house with rooms all round, especially if the light to it and the staircase is from a half landing window. There is always a sense of closeness in such a house that to me is very oppressive. If you can manage to get a hall, a ground-floor window in it I think absolutely necessary—a bay if possible. A hall lit from anywhere above 6 feet from its floor is to me a failure. You had better utilise the space in making your rooms larger, for I would always say make your rooms as large, or to appear as large, as you possibly can. I would always sacrifice breadth for length, for by that means appearance of size is gained.

As for the reception-rooms, I can say but little. Get them as large and as prettily shaped as possible, that is, break up the surface of the walls so as to get variety, but always above all things bear in mind that these rooms have to be furnished and lived in. Try and arrange the furniture, especially in the drawing-room and library. Bear in mind that the space round the fireplace is broad, free from draughts and as large as you can get it. On a winter day, with a big fire, often the cosiest place is quite by the side of the fire, but out of the direct rays of the heat. In ingle-nooks where you can get windows never omit them, but place them high up, the sill at least 4 feet 6 inches or 4 feet 9 inches from the floor.

As to the lighting, especially for small houses, keep the windows as large as possible, proportionately too large. This is, I believe, the secret of the success of many houses. Your client may say it may make a cold house in winter. Not with thick curtains and good fires, and the advantage of large windows for the remainder of the year is everything. Even all the year round the large window area gives a cheerfulness, an airiness to a house that makes that house a success. And one last word about these rooms. Do not be frightened of narrow rooms provided you can get them long, especially if you can get a bay in the side. A sense of size is everything towards comfort in living rooms.

Upstairs your bedrooms have to take their chance. You consider how they will come when you are planning the ground floor, but remember it is economic building as well as good building to put walls over walls, and not to have to carry your first-floor internal walls on girders. The bath-room should not be less than 6 feet 6 inches by 8 feet to make a pleasant one, and, unless it is impossible to plan otherwise, never put the w.c. in it. Of course you will be careful to make the approach to this room as unobtrusive as possible. The linen-closet also should not be put in a bath-room; but do not forget that a linen-closet on a landing, or in a passage as near the principal bedrooms as possible, is essential, and keep it large. Paper it with white glazed paper, and make it pretty, for a good housewife takes pride in her linen cupboard. I do not believe in running the hot-water pipes through it. They discolour the walls, and seem to throw off tiny flakes unless covered; but, remember, put this cupboard in a position no damp can possibly get at it. The box-room is necessarily to be as large as possible.

Generally see that an 8-inch stone ball is let down each flue when completed, and before the scaffolding is struck, to clear the flue of lumps of mortar that may have fallen and stuck, and to all top-floor fireplaces put grates with projecting heads—that is, projecting beyond the bars of the grate. This will generally secure your fires from smoking into the room. I am fond of windows over fireplaces. This necessitates an iron flue-door outside for sweeping. Beware lest the sweep insecurely fixes this flue-door; the wind will get it open, and then won't the chimney smoke till the mischief is found out! I generally cover opening with a York lintel, and have found no difficulty about the flue drawing from the ground floor, but on the first floor I should always use a grate with projecting head. This arrangement is cheerful in a room, but do not make the mistake of putting the top of cill too high. I think it should not be more than 4 feet 3 inches or 4 feet 6 inches from floor. I am particularly fond, as a general rule, of making the mantel-shelf quite high up on the wall. I think it seems to give dignity to the fireplace.

The offices I think as important as any part of the house, for it is getting very difficult to find satisfactory good servants, and not always so easy to keep them. Therefore, I advise arranging the house so that it can be worked with as little labour as possible, and make your servants' quarters as com-

fortable as you know how. You will want a kitchen, scullery, larder, pantry, store-cupboard, beer and wine cellar, w.c., and possibly a shed for a perambulator and a velocipede. Now, on account of expense, it is generally necessary to keep the kitchen down to the smallest dimension. And I think that 12 feet 6 inches by 14 feet 6 inches clear is the smallest you can give; but as this has to be the servants' sitting-room, if possible arrange a bay window where they can sit and work, and make it cosy. The cook, besides a dresser, wants a cupboard, and don't put it in the hottest place near the range, for it will have to hold many things for everyday use that dry up. Now that copper is no longer the fashion, and steel stewpans have taken their place, I think there is no necessity for the whole of the space under the dresser-drawers being used for pots, and two small cupboards can be formed here and will be found quite useful. I think a flue to the scullery is necessary, for either a supplemental small range or a gas oven should always be placed here. To the scullery you always fit a glazed stoneware sink; if you wish to get into the cook's good graces put a wood curb round it. She will damage and break far fewer plates, for dirty plates are greasy and will slip out of the best regulated fingers. Also put to face of wall on which the sink abuts white tiles at least two courses high, and when you have money to spare face the whole of the scullery and larder with white glazed tiles, also the pantry and the kitchen. Treat them like you would a dairy, the latter two rooms with patterned tiles. It's the height of cleanly wall covering and can be made look very pretty. Do not forget the gas point at the side of the cooking-range, so that a jointed bracket can be fixed and the cook able to see what she is doing. As to ranges, the pattern the Eagle people have patented seems the best, but I don't think the doors to the rack over the range is an advantage; they may make the kitchen a little less warm, but the cook is apt to hide things behind them or pop things inside and forget them. A tile back and an open rack at the top seems to me best.

Now, as to ventilation, never neglect a flue next to the kitchen flue to carry off smells and heated air, and make it large, at least 14 inches square. I always try to get one to the fireplaces of reception-rooms on the ground floor also, and fit them all with Sheringham ventilators. They may in many cases act as air inlets, although you provide air inlets in the corner of every room, but at any rate they disperse and, I think, partly carry off the hot air and fumes that hang about the ceiling, caused by gas or lamps. Of course, when the fireplace-flue gets well hot they act as extract shafts. People say it's easy enough to open windows and get plenty of change of air that way, but they seldom do and, when they are forced, are apt to complain then that they get too much change. As regards inlets, I have tried flues 18 inches by 9 inches in the thickness of the wall, facing them on the inside with slate and plastering over flush, delivering the air about 4 feet 6 inches from floor, and fitting with hit-and-miss brass plate, but these brass plates seldom fit and I am inclined to think a door on the Sheringham principle with a ball-catch is better.

I have settled the kitchen with its dresser and cupboard for the cook, and cosy corner for the servants where they can spend their spare time, for in this class of house a servants' hall or room can't be provided. The scullery should always lead direct from the kitchen, no passages between, and I like to have the coal-cellar and larder leading off the scullery and, if possible, a space set aside for cleaning knives and boots; this should be divided off by a screen. The servants' water-closet should, if possible, have the entrance under cover and be screened. I do not object to its entrance being placed inside the house like the other water-closet, for remember your servants are women and live in a rather unnatural and varied atmosphere, especially the cook. The store-room should be near the kitchen, and the wine-cellar lead out of the pantry. This latter, when it can be obtained, is an extremely convenient arrangement. If you can possibly avoid it never make the pantry a passage from the kitchen; both the pantry and kitchen must be separate rooms with doors of their own. I think a pantry next the dining-room with a serving-hatch from kitchen to pantry makes a very workable plan; of course double doors between pantry and dining-room are distinctly nice.

I do not like cellars, especially for larders, it is so difficult to get a current of air through them, but in small frontages they are often necessary. One precaution I would advise, that is, to see that the sewer in the road is low enough so that you can drain them, for if not you will find they are really splendid receptacles for storm water, and it's unpleasant to have a small swimming-bath for weeks under your house. The only immediate remedy I know of is to send for the local fire-engine. And the permanent one is to cover the floor and walls to a sufficient height with a material that water cannot penetrate—aspalte, or slate in cement rendered on face.

There is one item I have forgotten; it must be provided somewhere, don't forget, that is a tool-house and potting-shed for the garden.

Then, as to sanitary work, of course three w.c.'s are essential—

that on the ground floor for the gentlemen, that on the first floor for the ladies, and one in the offices for the servants. As to the former, in a small house I don't know of any spot that is not equally objectionable; of course, placing a hat and coat space with a lavatory before it partly negatives the evil. I have seen it placed off the library and having a secret door, but I did not like it; but of the two most usual places, off the front door, or off the garden door, I prefer the latter. Then, as to the one on the first floor, it is generally easy to arrange this satisfactorily. I always fit the closets with hinged seats, and this one I fit with a slop top, merely providing the housemaid's closet with a draw off sink and a small grating only, so that it shall be almost impossible to use this for slops, &c. A housemaid's closet where she can store brooms, dusters and cans, and draw off water, hot and cold, is essential. Then, I very strongly advocate a valve-closet without any overflow from the porcelain basin and no lead trap under, but to deliver straight outside with a double curve as flat as possible to the soil-pipe, which is open at the bottom and carried up at the top above all windows and is open there. I learnt it from a system published by Mr. Norman Shaw in 1877, and is the healthiest and most sanitary of any I know. Of course you at present will have a goodly percentage of the sanitary experts howling at you, and insisting on sealing everything up at the foot of the soil-pipe hermetically and putting lead-traps under your water-closet. You will find the gentlemen mostly belong to the professor type; they call themselves teachers, but are generally fussy and windy exponents of a more noisier master they toady to, who lays down the law that he has found the perfection of sanitary arrangement, and that it is impossible for this matter in question to go one step further. I would advise any man not to give a guarantee that drains will satisfy the requirements of these gentlemen; of course if your client wants to throw away money unnecessarily, here is a splendid opportunity for him. Don't think I do not advocate good drainage. I say, insist on a man-hole as near the boundary as possible and put in an interceptor the sewer side, carrying the drain through a half-pipe; also if there is any chance of an overflow of storm-water from the sewer in road, put in a valve to stop it. Also put in a man-hole at base of the soil-pipe, and if there is a long length of drain put in a man-hole where it has to turn a corner, and have your soil-pipe open top and bottom. But cover your man-hole with an iron grating so that fresh air may get through the chamber and into the drain in the freest possible manner, of course taking care that you form no *cul de sacs*; where gases may collect this is a much more rational method than introducing the air through a very small talc-flap grating, sealing up all the man-holes hermetically, trapping under the water-closet, and making the air traverse the whole length of the pipe before it escapes at the top of the soil-pipe. Then, when say the lower water-closet is used, the force of water creates suction, and the air thus drawn in has to pass over the surface of the remainder of the system and then float back again, for remember at the sewer end theoretically there is no exit for air, a kind of tide action, at times quite a manufactory of sewage-gas. Do you suppose that those traps under the water-closets in such circumstances remain trapped? I distinctly believe they most frequently are not. You all know the action of the wash-out closet; how you cannot always depend even with a 3-gallon flush that everything is cleared away. Now consider the trap under the valve-closet half full of substance, it will take but little suction to empty that trap of the water. As to the overflow of the basin of the valve-closet trapped and delivering into the box below the valve, I am sure the days will soon come when this arrangement is entirely one of the past. From a sanitary point of view it is as bad as it can be, especially the later patterns in which the holes are enormously large.

I myself dislike all wash-out closets; the only recommendation I can see is that they are cheap and at present pass the sanitary inspector, and some patterns have the trap, the receptacle hidden, hence they can be used in special positions. I think a soil-pipe and drain-pipes should be so arranged that they could be cleaned and should be cleaned at least once or twice a year, swept just as the dining-room chimney, or cleaned out, as the hot-water high-pressure boiler and the cisterns. But in the latter cases the immediate tangible unpleasant results of neglect are very apparent where, as in drains, the owner gets a certificate from a sanitary expert, carries it in his pocket, and displays it to his friends, or frames it as an ornament for his library, and prepares to live happily and securely as regards this matter for ever after, till something turns up, fever or what not, or even he may want to sell the property. Then there is another examination, and not only has the expert's dogmas much changed, but often the new tests are so severe that all ordinary work gives way before them. But enough of drains. Keep them simple, have as few traps as possible; what you do let it be of the best materials and best workmanship; never cover up till you have been able to satisfy yourself that it is all as perfect as you can make it, and above all give every facility for the air to circulate through the system by cutting the drains up where you get very long lengths; and where you can afford

it arrange a flushing-tank that shall flush out the system at intervals during the twenty-four hours.

Now I am on sanitary matters I would not have you forget that the water supply is equally as important. Have as large a tank-room as possible, and at least one window that will open in it, and double felt the roof to keep out both the heat and the cold. The place I like best for the hot-water circulating cistern is in the bath-room by the ceiling, cased in mahogany, as then it can be opened from the floor of the tank-room above. If you have constant or intermittent supply, I would have two galvanised iron cisterns in the tank-room, one to supply the water-closets and bath, and one the taps over sinks and the hot-water arrangements. If you have constant supply always try and arrange to have it by meter; you will save the extra expense by the fittings, and those abominations the small water waste-preventing cisterns to the water-closets can be done away with. Also I would recommend you to see carefully that the supply is securely fixed to the wall, especially when it delivers over the iron cistern, as, on account of the pressure, it is apt to be forced out of position and get loose, or if it touches the ironwork. Directly it even slightly loosens the fixing it will produce a dreadful buzzing sound, that comes on at all kinds of strange moments and lasts a dreadful time often, especially if the water be very hard, for as you all know, with very hard water after a year or two the best of taps will not work perfectly unless they are seen to and cleaned. I always fix the supply pipe by iron cistern to a 7-inch board firmly fixed to wall, and the pipe secured to board by wooden cleats screwed up tight, with an extra strong cleat immediately over the ball-tap.

Be careful that the valves to cut off supply from the cisterns to house are placed where they can be seen and got at immediately under the cistern, and that each one is properly labelled; and in the kitchen have a special peg, properly labelled with full instructions, to hang the tap on to turn off the water to the rising main. Remember hot-water pipes throw off black rays wherever they touch a wall or ceiling, and unless they are fitted and canvassed, or otherwise covered, they make everything dirty they touch, especially linen in a linen cupboard; and remember, also, felting keeps in the heat, and gives hot water the first thing in the morning. Remember that water-pipes had better be kept well inside the house and well under the ground to protect them from frost; but if the hot-water pipe is put too near the cold supply taps, although not unpleasant in winter it is very much so in summer.

Mr. BERNARD DICKSEE moved a vote of thanks to Mr. Vacher for his paper. He said he did not like valve closets but the wash-down pedestal closet. The trap was visible, and if it were dirty it could be seen. Too large a soil-pipe should not be used. A 3-inch soil-pipe was quite large enough.

Mr. FRANCIS HOOPER seconded the vote. A most economical form of decoration, he said, could be got by the use of joinery. In small houses there should, at any rate, be one large room.

Mr. GOLDSMITH, hon. secretary, considered a window above a fireplace was objectionable. Rooms with long low windows made cheerful living-rooms.

After some remarks from Mr. Greenop, Mr. Hewitt, Mr. W. E. Davis and Mr. M. Garbutt, the President put the vote to the meeting and it was carried by acclamation.

Mr. VACHER briefly replied and the proceedings terminated.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

ON Monday Mr. J. W. Morkill, M.A., read a paper at the meeting of the Leeds and Yorkshire Architectural Society, on "The Knight Templars in England, with Special Reference to their Possessions in Leeds and District." Mr. G. B. Bulmer presided.

Mr. Morkill said the Knight Templars differed from most other monastical orders. They were not only monks, but soldiers. The increase of the order was rapid, its exploits most brilliant, and its miserable downfall made its history most romantic. In the fourth century of the Christian era, the fourth Emperor Constantine built a church, called the church of the Holy Sepulchre. Very many Christians made pilgrimages to it, and it was owing to the extreme persecution of those persons that nine knights banded themselves together to protect them. At first they had no habitation, but afterwards they were given a residence within the precincts of the temple upon Mount Moriah. From that they got their name. The original intention of the body was to protect the poor Christians, but afterwards they undertook to protect Palestine generally and the Eastern Church. Subsequently many of them came to Europe, and established themselves in different places. Their first appearance in England was in 1128, when they became extremely popular, and were granted many immunities. They had seventy-two rules to guide them, which Mr. Morkill

said were suited more for a boarding-school than for a band of soldiers. The Templars fought many battles in Palestine, and by overwhelming numbers were gradually exterminated. Those in France and England were imprisoned and tortured, and finally, in 1312, all who were not killed were liberated, and the order was abolished. The principal habitation of the Templars near Leeds was at Whitkirk. The Templars were given that estate in 1154 or 1155, and also the church there. Whitkirk was the centre of a large district belonging to them, extending on the one hand to Tadcaster and on the other to Ilkley. The Templars lived at the manor of Templenewsam, which was quite distinct from Whitkirk. The manor house at Whitkirk was still in existence, and the Court was now regularly held there. Of the jury who made presentments, some of them were summoned from the neighbourhood of the Leylands, Leeds, which was part of the manor. The present lady of the manor is the Hon. Mrs. Meynell-Ingram. Many of the houses in the district of Leeds referred to were marked by one of the crosses of the order. In Lowerhead Row there were about a dozen crosses, and on the houses in Templar Street were also to be seen this peculiar cross. In the village of Newland, near Normanton, the same crosses were likewise found.

A vote of thanks to the lecturer closed the proceedings.

AMERICAN HOUSES.

A WRITER in the *Greening Star*, in recording that the Forest Glen Estate in Virginia had been sold, offers the following remarks about the character of the houses that are likely to be built on the plots:—

It is a familiar fact to those who have given the subject of domestic architecture the slightest attention, that there is fashion in architectural forms just as there is in the cut of a coat or the shape of a bonnet. Just now houses that pretend to be anything, or in other words that aim to be the vogue, are either fashioned in the forms peculiar to the Romanesque style or present the quaint conceits of the colonial style, or perhaps they show that strange jumble of a number of orders of architecture that is called, for want of a better name, the composite. At any rate, whatever happens to be the rage at the time is the style which the average man elects to have when he contemplates the erection of a house. The point of interest, however, in this connection is one that has not been generally noted, and that is the fact that it makes but little difference what a house is going to cost, it must be in the style. The elegant house costing perhaps 100,000 dols. is repeated in all its essential details in a house costing only 5,000 dols. There is the brown stone, the carved pillars, the towers, the tiled roof, the hard-wood vestibule in the front of the one, and in the other is found the same general features with such differences in the material used and the workmanship employed as the available funds make necessary. The same principle hold good in the interior. The house of moderate cost has all the modern electrical devices which are supposed to contribute to ease of living. If it is the style to have a white and gold parlour that is what the occupant of a cheap house has. He has tiled fireplaces, and a grille over the glass in his front door and a platform staircase, and if he so desires he has a central hall where he can hang the family portraits and introduce the other features of a baronial hall. It is quite evident, in this city at least, that the man of moderate means does not need to build a castle to enjoy what is known as "all modern conveniences," or be in the swim.

Since the fashion has recently been set of having the main entrance to a residence through the back-yard or, to put it more elegantly, through the courtyard in the rear of the house, there has been considerable curiosity expressed as to how this fad will be applied to small houses. It is ridiculous to suppose that only the fortunate owners of corner lots will desire to adopt this style. Therefore the problem of introducing this new fashion will be complicated by the necessity of adapting it to houses in the middle of a row. For example, a man desiring to erect a two or three storey house at a cost of not over five or six thousand dollars concludes that he wants one of these new entrances. As such a house is not apt to be more than 20 feet wide, perhaps not more than 18 feet, taking the space required for a driveway from the lower storey would necessarily oblige an economy in the details. A driveway wide enough to permit the passage of an ordinary carriage ought not to be much less than 6 feet wide. Allowing space for a hallway there would remain not a great width for the furnace-room or dining-room and kitchen, which as a rule occupy the basement storey of a house of this character.

The space devoted to these domestic departments would perhaps appear at first to be slightly cramped, but as an offset the occupant could have the proud satisfaction of knowing that his home was in style. There could be an entrance from the side of this driveway into, for example, the central hall of the house. No doubt a number of ways of adapting this entrance to houses of moderate size will occur to the ingenious architects who will be called on to wrestle with this problem. It is

possible that the driveway will be introduced, and they will not give it the width necessary so that it could be used for carriages, on the supposition that there will be but few visitors who will insist on making calls in a carriage.

ST. MARY'S, OXFORD.

THE controversy over the age and value of the statues belonging to the church of St. Mary the Virgin is not ended, for while the former letters were written without examination of the building, the result of an examination can now be given. In an additional letter the Secretary of the Society for the Protection of Ancient Buildings writes to the *Times*:—

It will interest those of your readers who followed the recent correspondence in the *Times* on the subject of the statues at St. Mary's, Oxford, to know that they have now undergone a careful examination at the hands of two professional members of the Society for the Protection of Ancient Buildings. An exhaustive report has been prepared, which can be seen on application. Its substance is as follows:—Of the twelve statues, ten are ancient, and though they have been patched from time to time, they are on the whole in a remarkable state of preservation. They are monoliths, about 7½ feet high, representing St. Mary the Virgin, St. John the Evangelist, St. Hugh of Lincoln, Edward the Confessor, St. Cuthbert, and five other Bishops. The hands are for the most part new or missing, and in two cases the faces have come away. There are other repairs, especially to the thin folds of drapery. The king alone has some parts of his tunic, &c., made up in Portland cement, which adheres well to the stone. Most of the original masonry is so hardened by time that a penknife will make no impression. In design and execution these figures are second only, among English Medieval sculptures, to those at Wells. In spite of all deficiencies they remain invaluable as works of the highest art. This being so, I cannot believe that the University will consent to their removal.

GENERAL.

Mr. A. J. Butler, M.A., Fellow of Brasenose College and Junior Proctor, has been appointed a curator of the Ashmolean Museum, in the place of Professor Westwood.

A Gold Vase has been bequeathed to the Museum of Amsterdam by Madame Von de Goltz. It was presented to Admiral Ruyter by the States-General. It should be placed near the numerous paintings which represent Ruyter's victories.

The Jurors who, in addition to the academicians and officials, will take part in the selection of the works in connection with the competition for the Grand Prix de Rome, section of architecture, are MM. Moyaux, Mayeux, Paulin, Ullmann, with MM. Guadet and Guillaume as supplementary jurors.

Mr. W. O. Foster, of Apsley Park, has offered to give 1,000*l.* towards the building of a new infirmary at Bridgnorth, and Mr. J. Martin Southwell a plot of land for the site.

Mr. Horace Cheston, we learn, has taken into partnership Mr. J. C. Perkin, who was articulated to Messrs. Paley & Austin, of Lancaster, and who has been with him for over nine years. The name of the firm in the future will be Cheston & Perkin.

A Canopied Reredos designed by Mr. Pearson, R.A., has been presented to Peterborough Cathedral by the family of the late Dr. Saunders, Dean of Peterborough from 1853 to 1878.

Mr. Arthur Vickers, secretary of the Kildare Archaeological Society, has it is stated been appointed Ulster King-of-Arms in succession to the late Sir Bernard Burke.

Mr. H. Higginson, architect, read a paper on "House Decoration" at the last meeting of the Carlisle Architectural, Engineering and Surveying Association.

The Board of Manufactures, Edinburgh, have granted the Society of Scottish Artists the use of the Royal Academy National Galleries for their autumn exhibition this year.

A Roman Catholic Church was opened on Thursday at Kidsgrove. It was designed by Messrs. Sugden & Son, of Leek.

The Sixty-seventh Exhibition of the Royal Scottish Academy was opened for private view on Friday last, and to the general public on Saturday.

The Fine Art Committee of the Leeds Corporation have fixed the private view of the Spring Exhibition of pictures for the 20th inst. The exhibition will remain open till June.

The Seventh Annual Exhibition in connection with the Paisley Art Institute closed on Saturday last. The results have been exceedingly satisfactory.

Mr. George Henry Cox, architect, Birmingham, met with his death on Tuesday, being run over by a train while crossing the Midland Railway near Burnt Green Station.

Mr. A. Swash, of Newport, has obtained the first prize in the competition for laying out eleven acres of the Fields Estate, Newport, for building purposes. Messrs. Veall & Sant, architects, Cardiff, were the assessors.

Mr. George Donaldson, who was vice-president of the Jury of Awards at the last Universal Exhibition in Paris, has obtained admission to the Legion of Honour for services rendered to art in France.

INDEX AND DESCRIPTIONS TO THE ARCHITECTURAL ILLUSTRATION SOCIETY'S PLATES. (SECOND SERIES, 1892.)

NOS. 449-453.—VIEWS OF HANOVER CHAPEL, REGENT STREET, W.
Measured and drawn by Francis Edward Ward. C. R. Cockerell, R.A., architect.

Royal Academy silver medal, 1891.

NOS. 454-459.—VIEWS OF 185 QUEEN'S GATE, W.
R. Norman Shaw, R.A., architect.

NOS. 460, 461.—VIEWS OF THE NEW HOSPITAL FOR WOMEN,
EUSTON ROAD, N.W.

J. M. Brydon, architect. The building is built of stock brick for the general walling, and all the dressings in the way of string-courses, cornices, pilasters, quoins, &c., are in cut and rubbed red brick, and the carving is also in red brick, and the whole of the entrance-porch is also in cut red brickwork. The only exception to this general treatment is in the boundary walls and gate piers, where the moulded work is in Portland stone, as shown in the general view.

NOS. 462, 463.—VIEWS OF 20 JAMES STREET, BUCKINGHAM
GATE, S.W.

Reginald Blomfield, M.A., architect.

NOS. 464, 465.—THE ENTRANCE, MONTACUTE, AND THE SCREEN,
WESTER KERK, ENKHWYZEN.

From drawings by Reginald Blomfield, M.A., architect.

NOS. 466, 467.—VIEWS OF ST. CATHERINE'S, NEAR BATH.

NOS. 468, 469.—THE DOORWAY, FOUNDLING HOSPITAL, CORDOBA,
AND THE CATHEDRAL, GRANADA.

From drawings by Francis W. Bedford.

NO. 470.—THE OLD BANQUETING-HOUSE, KENSINGTON PALACE.

Probably built by Vanbrugh. From a drawing by A. M. Philips. This building stands in Kensington Gardens, a little northward of the Palace. The front is of brown and red brick, with Portland stone dressings, the cornice and Doric entablature being of cement. The interior is richly panelled and decorated with Corinthian columns and entablature. It is now used as a potting-shed for the gardeners, and is in a deplorable state of repair. There is no direct evidence as to who the architect was. It seems probably the work of Nicholas Hawksmoor. The date is 1705.

NO. 471.—ADDITIONS TO GLASGOW UNIVERSITY: GARDEN FRONT.
John Burnet, Son & Campbell, architects.

NO. 472.—BOARD-ROOM, NO. 5 LOMBARD STREET, E.C.

W. Dunn & R. Watson, architects. The walls in the basement of this building were excavated and new offices formed. This board-room is panelled in deal, painted white; the marble jambs of the fireplace opening are in sienna marble. A peculiarity of the room is that it is below the ground level, the light being reflected from a large tile slope on one side.

NOS. 473-476.—VIEWS OF THE MANOR-HOUSE, WANSWORTH.

(Now destroyed.) From photographs by G. E. Martin. This house was built about 1670, by Peter Paggen. It was built of brown brick, with red brick dressings. The cornice and door cases are of wood. The staircase shown in the photographs had the walls and ceiling elaborately painted with figure subjects. The carving of the screen in the hall was exceedingly good. It should be noted that the carved panel on plate No. 473 is printed upside down upon the sheet.

NOS. 477, 478.—THE CHURCH OF ST. SALVI, ALBI, AND THE
CHURCH OF ST. AUSTREMOINE, ISSOIRE.

From drawings by J. A. Slater. This view of the church of St. Salvi, Albi, was taken from the roof of Albi Cathedral. The church represented is built for the greater part of red brick. The church of St. Austremoine, Issoire, is a characteristic specimen of the Romanesque style in the Auvergne. The treatment of the transepts is remarkable, being raised to a sufficient height to support the domed crossing in the tower. The easternmost of the chapels is finished with a square end. As an example of pyramidal design the church, seen from the east, is a fine type. The interior, vaulted, is very interesting, as affording a comparative study to the external effect. Some of the capitals are very interesting; one in the apse notably so, where *The Last Supper* is represented, the table-cloth going completely round the capital with fine decorative effect.

NO. 479.—COMPETITIVE DESIGN FOR THE BATTERSEA INSTITUTE.

R. Watson, architect. This is a design submitted in a limited competition.

NOS. 480, 481.—THE PULPIT, RAVELLO CATHEDRAL, AND THE
BISHOP'S THRONE, RAVELLO CATHEDRAL.

From drawings by J. A. Slater. Ravello is one of the most interesting places in Southern Italy, situated a few miles from Amalfi, in the Gulf of Salerno. Nowhere in South Italy can more beautiful specimens of Byzantine art be met with. The pulpit here represented, in white marble, and inlaid with mosaics, was presented in 1272 to the cathedral, and bears this inscription:—"Nicolaus de Fogia marmorarius hoc opus fecit." The bishop's throne is on the north side of the choir. One remarks with interest the thinness of the inlaid walls to stairs—just slabs of white marble.

NOS. 482-485.—VIEWS OF GEORGE HERIOT'S HOSPITAL,
EDINBURGH.

From measured drawings by R. Shekleton Balfour, silver medallist, Royal Institute of British Architects, 1892. It was founded by George Heriot, court jeweller to James VI. of Scotland and I. of England. He left 23,655*l.* sterling to found and erect a hospital at Edinburgh for educating the sons of certain burgesses. The question as to who the architect was has always given rise to much discussion, though from careful investigations which have been made, it would appear that William Wallace, who was appointed master mason in the year 1628, and William Aytoune, who succeeded him, had the principal share in the designs. The name of Inigo Jones has frequently been mentioned in connection with the work, but no authority can be found to corroborate this. The foundation-stone was laid on July 1, 1628, and the hospital was dedicated in 1659.

NOS. 387, 388.—ELEVATIONS AND PLAN OF A COUNTRY HOUSE,
DORSET.

Ernest George & Peto, architects.

NO. 389.—HOUSE AND STUDIO, PALACE COURT, BAYSWATER, FOR
MR. PERCY MACQUOID.

Ernest George & Peto, architects.

NO. 390.—A GROUP OF COTTAGES AT EATON HASTINGS, BERKS,
FOR MR. ALEXANDER HENDERSON.

Ernest George & Peto, architects.

NO. 391.—DINING-ROOM AND LIBRARY, FOR MR. W. S. SALTING.

Ernest George & Peto, architects.

NO. 390.—INN AT FORTINGALL, PERTHSHIRE.

W. Dunn & R. Watson, architects. This is an addition almost amounting to a rebuilding of an existing inn. The walls are of stone, covered with rough cast, and as the only stone fit for moulded work has to be brought from a distance, very little moulding is used, the building, like the rest in the neighbourhood, being very plain.

NO. 391.—CHURCHCROFT, PUTTENHAM, NEAR GUILDFORD.

Halsey Ricardo, architect.

NO. 392.—HOUSE AT HAMPSTEAD.

E. J. May, architect.

NO. 393.—HOUSE IN CONNECTICUT, U.S.A.

E. J. May, architect.

NOS. 394, 395.—GEORGE HERIOT'S HOSPITAL, EDINBURGH.

From measured drawings by R. Shekleton Balfour, silver medallist, Royal Institute of British Architects, 1892. (See description, Nos. 482-485, *ante*.)

NO. 396.—ST. PETER'S COLLEGE, RADLEY: NEW CLOISTER AND
PROPOSED NEW CHAPEL AND HALL.

T. G. Jackson, A.R.A., architect. Radley College having lately become the freehold of the trustees, they are now gradually replacing by permanent structures the temporary buildings of timber and iron originally put up while the estate was only held on lease. They have lately built a sanatorium and new cloisters with studies and other rooms above, from the designs of Mr. T. G. Jackson, which are shown in the illustration. The completion of his design by a new chapel and hall is intended to follow shortly.

NOS. 397, 398.—VIEWS OF THE LIBRARY, LINCOLN CATHEDRAL.
Sir Christopher Wren, architect.

NO. 399.—GLENLYON HOUSE.

W. Dunn & R. Watson, architects. This is an alteration and addition to Glenlyon House, an old historic house at the entrance to Glenlyon. The walls are of stone, rough cast; the

roof is covered with a very fine thick slab, locally procured. The drawing-room of the first-floor in the south wing is a long room with a ribbed plaster ceiling. The entrance-hall is panelled in deal.

NO. 400.—CHURCH OF ST. MARY, BOTTESFORD: NEW ORGAN.
Gerald C. Horsley, architect.

NO. 401.—THE REGISTER OFFICE, EDINBURGH.
Robert Adam, architect. Built about 1771.

NO. 402.—THE ATLAS ASSURANCE COMPANY'S OFFICES,
CHEAPSIDE.
The late Mr. Thomas Hopper, architect.

NOS. 403, 404.—THE SECTION AND PLAN OF FIRST FLOOR OF
THE REGISTER OFFICE, EDINBURGH.
Robert Adam, architect. Built about 1771.

NOS. 405, 406.—THE INTERIOR OF A CHURCH, TOSCANELLA, AND
ST. CATHERINE, RAVELLO.

From drawings by J. A. Slater. The church at Toscanella, at some distance from the town, dedicated to St. Peter, is a most interesting example of Mediæval art, and with the church of St. Maria would make a splendid subject for any student who could spare three months for studying them completely, with the end in view, perhaps, of a monograph. Neither of them are used any longer for religious services. St. Catherine, Ravello, is a ruined church by a rocky path.

NOS. 407, 408.—HOUSES AT PALACE COURT, BAYSWATER, W.

The late Mr. J. M. MacLaren, architect. The first sketches for these houses were made by Mr. J. M. MacLaren. The work was completed by W. Dunn & R. Watson. The staircases of both houses are panelled in deal to the first floor, and there are elaborate plaster ceilings in the dining and drawing-rooms.

NOS. 409-412.—VIEWS OF WELL COURT (WORKMEN'S HOUSES
AND CLUB ROOM), EDINBURGH.
Sydney Mitchell, architect.

NO. 413.—THE SEDILIA, BRISTOL CATHEDRAL.

From a drawing by J. A. Slater. It is on the south side of choir. One notes with interest the small figures in intersecting O. G. arches, under vaulted canopies, with dark space behind.

NO. 414.—THE SOUTH DOOR, HADDISCOE CHURCH.
From a drawing by Sydney Tugwell.

NOS. 415, 416.—VIEWS OF THE RIVER HOUSE, TITE STREET,
CHELSEA.
Messrs. Bodley & Garner, architects.

NOS. 417, 418.—GEORGE HERIOT'S HOSPITAL, EDINBURGH.

From measured drawings by R. Shekleton Balfour, silver medallist, Royal Institute of British Architects, 1892. (For description, see Nos. 482-485, *ante*.)

NO. 419.—STATUE OF BARTOLOMEO COLLEONI, VENICE.
Andrea Verocchio.

NO. 420.—HUNTING LODGE, NEAR MALMESBURY, WILTS.
H. Wilson, architect.

NO. 421.—PASTORAL STAFF FOR THE BISHOP OF ST. ASAPH.
The late John D. Sedding, architect.

NO. 422.—ALTAR CROSS FOR PRIVATE CHAPEL, WELBECK ABBEY
H. Wilson, architect.

NOS. 423, 424.—VIEWS OF SCUOLA DI SAN ROCCA, VENICE.
Scarpagnino, architect.

NOS. 425, 426.—VIEWS OF TRINITY GROUND, MILE END ROAD,
LONDON.

NOS. 427-432.—VIEWS OF THE NEW ROMAN CATHOLIC CHURCH
OF THE HOLY ROOD, WATFORD.
John F. Bentley, architect.

NOS. 433, 434.—VIEWS OF TRINITY GROUND, MILE END ROAD,
LONDON.

NOS. 435-438.—VIEWS OF THE ETON MISSION CHURCH,
HACKNEY WICK.

Messrs. Bodley & Garner, architects. The Eton Mission Church is an example of a town church of simple character. The design is one of some originality. The width is considerable, though the aisles are quite narrow and subordinate to the centre portion. The piers are simply square on plan, and the arches and windows have little or no mouldings, except splays. The east end externally is the chief feature. It rises from the pavement of the street. The lower part has an ambulatory, with small traceried windows, and above a large window, placed high up. In the gable there is a carved crucifix with SS. Mary and John. The choir is formed by high screens. They are painted a dark red, but as yet lack their contemplated decoration of gilding, &c. The roofs are painted simply, so that they can be enriched at a future time. The choir fittings are not yet done, funds being insufficient for them. The

foundations had to be very costly. In parts 20 feet had to be excavated before a sufficiently firm foundation was found, for the site is on the edge of the marshland. There is a side chapel, also with a painted roof, which is broadly and simply treated. The whole effect is that of an old town church of almost severe character, though it is not in any way a copy of old work. Effect has been obtained rather by proportion and general character than by any enrichment of detail.

NOS. 439, 440.—WYCHEN CASTLE AND THE MUSIC SCHOOL,
NYMEGEN, HOLLAND.

From drawings by Reginald Blomfield, M.A., architect.

NOS. 441, 442.—DESIGN FOR TOP-LIGHTED CHURCH, NEAR
VICTORIA STREET, WESTMINSTER.
John Belcher, architect.

NOS. 443, 444.—LECTERN, WELLS CATHEDRAL, AND OLD CHEST
WELLS.

NOS. 445, 446.—NEW CHURCH, MILES PLATTING, MANCHESTER.

Leonard Stokes, architect. This church, which the Norbertine Canons are about to build in the poor and populous district of Manchester known as Miles Plating, is designed to accommodate about 1,200 worshippers, and is so planned that the greater number of these can see the high altar. The work has not yet been begun on account of lack of funds; but it is proposed to build the church almost entirely of the local bricks, stone, however, being used for the nave piers, arches, vaulting ribs, &c. As the church is to be specially dedicated to the Blessed Sacrament, any richness in the design has been massed round the high altar, the nave depending upon its size and simple dignity for effect.

NOS. 447, 448.—CAPITAL IN NAVE, MONREALE CATHEDRAL,
AND AMBO IN THE CATHEDRAL, RAVELLO.

From drawings by J. A. Slater. The capital in nave of Monreale Cathedral is of white marble, resting on a grey granite column, and carrying cushioned abacus, and arch covered with mosaic. White marble ambo on north side of nave, Ravello Cathedral. Representations of Jonah in mosaic; steps ascend from either end of platform, semicircular wall towards nave, fronted by eagle bearing book-rest. The two discs on left are in porphyry. It would be difficult to find a design in which simple lines have resulted in a more dignified composition.

NOS. 449-451.—VIEWS OF FOX OAK, BURHILL, NEAR WEYBRIDGE.
Halsey Ricardo, architect.

NOS. 452, 453.—CHURCH OF ST. MARIA DI CASTELLO, CORNETO,
AND A CHURCH AT CORNETO.

From drawings by J. A. Slater. The church of St. Maria di Castello, Corneto. This is the west front of an exceedingly interesting church. The tower that appears in the view is one of several in the town, which give it a remarkable appearance when seen from a distance. The capitals to the nave arcade and vaulting shafts are in porphyry, telling as "darks" against the rest of the light stonework; steps of font inlaid with marble mosaic.

NOS. 454, 455.—ST. PAUL'S CATHEDRAL: SOUTH SIDE OF CHOIR
STALLS AND DETAILS FROM CHOIR STALLS.

The Architect.

THE WEEK.

THE great event of the week, at least for British politicians, is, like most mundane things, not unrelated to architecture. If, as so many desire, the number of members of Parliament could be diminished one-seventh, then we should have fewer complaints about the inadequacy of BARRY'S House of Commons. That seating accommodation can be insured in it for 640 members is undeniable, but the conditions are not favourable either for comfort or the despatch of business. When the programme of the Houses of Parliament was prepared for the competitors it was supposed that so many members would not attend as have been seen of late years. The accommodation, therefore, is barely equal to the demand on it, and a migration elsewhere would not be regretted by the officials of the House. It is remarkable that at the beginning of the century, as at its close, the House of Commons was found to be too small. The ancient chamber, in which it was said that members, with their backs to the fire, ruled the world, had to be enlarged, in order to make room for the legislators who were evicted from College Green in Dublin. In the course of the operations some ancient paintings were discovered on the walls of St. Stephen's Chapel. The subject of one of them was not clear, and the aid of the Society of Antiquaries was invoked. It was declared to be a representation of JOB and his family. But the conclusion was supposed by some to be only an indication of the fate of the Speaker. There is no doubt that the Chair has been a capital place for anyone who wished to imitate the patriarch in the exercise of patience.

IN 1891 two painted medallions were discovered on the wall of a house in Pompeii. The subjects were young men, their heads being crowned with laurel. One was clad in a white, the other in a dark, toga. A scroll was introduced near each bust. On one "Homer" was discerned. Professor SOGLIANO believed he was able to read "Sappho" on the companion scroll. It was concluded that the medallions were portraits of VIRGIL and HORACE. But what conclusion in archæology is accepted without opposition? At the meeting of the German Archæological Institute which was held a few days ago in Rome, Dr. MAU brought forward a new theory. He maintains that what is inscribed on one of the scrolls is not "Sappho," but "Plato." The medallions, according to him, are not portraits, but ideal paintings of two literary students, who were supposed to be engaged on the great representatives of poetry and philosophy. They are none the less valuable as examples of decorative painting.

THE Wednesday lectures at Carpenters' Hall will begin next week, when Professor J. M. THOMSON will speak upon the "Chemistry of Building Materials, Pigments and Protective Agents." On the succeeding Wednesday the following lectures will be given, viz. "Electric Lighting," by Professor SYLVANUS THOMPSON; "The Italian Renaissance, as exemplified in St. Peter's, Rome, in Florence and Venice," by Professor BANISTER FLETCHER; "The Early Renaissance in England," by Mr. J. A. GOTCH; "The Later Renaissance in England," by Professor T. ROGER SMITH; "The Tower Bridge," by Mr. J. WOLFE BARRY. The report by Mr. LLEWELLYN SMITH to the London County Council renders justice to the efforts which are being made by the Carpenters' Company in promotion of technical education. It records that 500*l.* a year has been contributed to the City and Guilds Institute, and a donation of 1,500*l.* towards its equipment. The company in 1886 built an institute at Stratford, at which various technological subjects, chiefly bearing on the building trades, are taught. Last year the company opened day-classes in the same building, and are now making it into an organised science school. The capital and annual outlay on the Institute since its commencement has been 12,915*l.* A free technical library has been opened in Carpenters' Hall; a trade wood-carving school in connection with the Institute of British Wood-Carvers, in Chapel Street, Bedford Row; and an

amateur school at King's College. Aid has been given towards the teaching of subjects connected with the professorships of architecture at King's and University Colleges, and the use of rooms in the Carpenters' Hall is allowed to various societies connected with the building trades. Independent of donations and subscriptions to the City and Guilds Institute, the total cost of the company's educational work in the last eight years has been upwards of 18,000*l.*, and further plans for the promotion of technical education are now being considered.

THE following are the questions to which the inspectors of schools in England will have to send replies after the annual visits, which begin this month:—"Site—(1) Is it open and airy? (2) Does it provide about a quarter of an acre for every 250 children accommodated? Playground—(1) Is it of sufficient size? (2) Is it provided with gymnastic apparatus? Building—(1) Is it, as regards general plan, convenient and suitable? (2) Is it dry? (3) Is it in good repair? (4) Is it well built of stone or brick? (Stone walls should be at least 20, and brick walls at least 14 inches thick.) (5) Are the rooms of reasonable height? (6) (a) Is it light in all parts? (b) Is the light so admitted as not to incommode teachers or children when at work? (7) Is it well warmed and free from draughts? (8) Is it well ventilated? (Rooms with open roofs should have apex ventilation, and a ceiled room should have windows opening to the ceiling.) 9. Are any class-rooms passage rooms, or below the size of 18 by 15 feet? 10. Are the staircases and entrances convenient and separate for each department, and sufficient for clearing the school quickly? 11. Are there cloak-rooms? And, if so, are they distinct from the school-room and class-rooms, and are they sufficient? 12. Are the closets and urinals light, sanitary, sufficient, well disconnected from the school, and separately approached by each sex from the schoolroom itself? 13. If there is any infant class, is it taught in a separate class-room? Apparatus, &c.—Is the school well equipped in respect of (a) furniture, (b) apparatus, and (c) books? Does the school provide the accommodation allowed to it in the Blue Book, if adequate accommodation at desks and benches is taken into account?" It will be evident that no extravagant conditions are expected to be realised by the managers, although the circular of the Education Department has caused some dissatisfaction.

LAUNCESTON CASTLE and Launceston Priory are so connected with the history of England as to be matters of more than ordinary interest. The castle was completed by WILLIAM THE CONQUEROR, and the priory was founded in the reign of his son, HENRY I., A.D. 1126. Within 200 years of its foundation the priory became a stately monastic building, and, at the end of another 200 years, it was the wealthiest priory in Cornwall. It had probably sheltered its benefactors, the son of King JOHN, RICHARD, Earl of Cornwall and Poitou, and EDWARD the Black Prince, as well as other illustrious earls of the county. At the general dissolution of English monasteries (A.D. 1536-39) Launceston Priory shared the common fate. It was levelled to the ground. Its walls, its piers and arches were thrown down and either removed to distant places or buried in rubbish. The site of the building was afterwards used for depositing waste and rejected matter of all kinds, until at length its actual locality was unknown. After the lapse of 350 years an attempt has now been made to discover the ruins, and happily some of them have been revealed. By the courtesy of Mr. TROOD, the owner of part of the Priory meadow, some general explorations have been made by the Launceston Scientific and Historical Society. Bases of piers, portions of arches, fragments of tombs and tiles, and foundations of walls have been found. Mr. TROOD now offers to sell to the Society, for the public, about a quarter of an acre of the most important part of the site. It is believed that access will be obtained to this part through the adjoining churchyard of St. Thomas the Apostle. It is beyond all doubt desirable to accept the offer. The land with its interesting contents can be secured and excavated and fenced for permanent preservation at a cost of about 130*l.* The committee of the Society ask immediate public aid towards these objects. Subscriptions will be received by Mr. OTHO B. PETER, Launceston.

THE FUTURE OF SCULPTURE.

WHEN BENJAMIN WEST, P.R.A., was asked about the value of the Elgin Marbles, he said:—"I think them of the highest importance in art that ever presented itself in this country, not only for instruction in professional studies, but also to inform the public mind on what is dignified in art." Over seventy years have passed since that evidence was given, and would any impartial witness have the courage to say that our sculptors are more able or the public more enlightened about sculpture than in the days when the frieze, metopes and pedimental figures were still in their positions in the Parthenon? Must we not acknowledge that the educational influence of the sculpture has been of little account? It was brought with the best intentions from Athens, and the House of Commons, in voting a large sum of money, was hopeful that the pieces would be turned to account by artists; but all who took part in the transaction were at the time under a sort of delusion, from which, unfortunately, we are not yet free.

We are so successful in this country in utilising the most obdurate materials in manufactures, it is easy to imagine that there is a process for making artists and lovers of art. One element in it is a collection of pictures and statues. We are so convinced of the influence which can be exercised by such works that we do not make any provision for explaining them. Because RAPHAEL'S mind was supposed to have acquired new powers by merely looking at the paintings in the Sistine Chapel, it was supposed that it was only necessary to deposit marbles in Bloomsbury and paintings in Trafalgar Square in order to convert sightseers into Greeks and Italians. There was nobody to inquire whether the sculpture and the pictures in any way corresponded with the needs of the British mind. The works were put there at great cost, and it was considered to be the business of the public to become transformed.

At present we have to deal only with the sculpture, and we have no hesitation in maintaining that the Parthenon treasures have not accomplished a revolution among us. The figures have given rise to a good deal of speculation, but that was not the aim of Parliament in granting the purchase-money. They were expected to acclimatise the Classic style in England, and we are not more attracted towards it than the Englishmen who lived a century ago. To one class of critics, and to most sculptors, this indifference is culpable; but we may ask, does it not arise from our being unlike the Greeks in our condition of life and our manner of thinking? If so, destiny should bear the blame for the change.

In the first place, it may be admitted that we do not get up a taste for sculpture in the same way as the Greeks. They did not employ foreign works for models. The art was native, and grew from a humble beginning. They did not presume to expect that all that was necessary was to import the finest examples and to begin with rivalling them. They were more humble, and made sure of one stage before they advanced to a higher. The people progressed with the artists. The subjects were always familiar to them. As there was a respect for types ordinary men were not puzzled by novel treatment. License would not be tolerated. There was a sort of unwritten code which prescribed limits, and the most imaginative sculptor would hesitate before he attempted an innovation. PERICLES suffered because PHIDIAS introduced a portrait of him as a testimony of friendship. How unlike is our practice. A modern sculptor would be condemned if one of his figures recalled another by himself or by a different artist.

Then, again, there was a homeliness about the most exalted figures of the Greeks which is incomprehensible to us. Every man may not have supposed that the gods and goddesses were impersonations of natural phenomena. The dwellers in Olympus rather appeared as beings who had all the good and bad qualities of the Greeks. Absolute perfection was not claimed for one of them. Their foibles made them akin to mortals. Statues of the divinities therefore to a Greek represented beings that might be said to be familiar to everybody. We consider that figures of characters created by SHAKESPEARE or SCOTT would excite about as much awe in a modern exhibition as did statues of the Olympians in a Greek town. We must not confound

our notions of reverence for the unseen with that which was found in Greece.

There was another reason for the existence of sculpture representing god-like beings, which we cannot well appreciate. With the Greeks there was a sort of mystical importance attached to beauty. It was honoured as a divine gift. Handsome and shapely youths were in some places considered to be the only mortals that were eligible for priests or assistants in religious ceremonies. Elsewhere or in similar ceremonies beautiful women were employed, and probably those who were represented in the frieze of the Parthenon were not much idealised. We cannot imagine how PHRYNE'S rising from the sea could be a part of a religious ceremony, for in no European watering-place would such an exhibition be tolerated; but the Athenians were able to regard it with reverence. The difference in ethics between past and present in regard to that incident by itself suggests that in modern times we can never admire sculpture under similar aspects with the Greeks. We have lost the old associations which made the figures as it were eloquent to all. Now they are simply combinations of lines and contours, which have so little meaning for us that we might put the Panathenaic frieze around a church without any fear that it would do more to paganise the worshippers than the caryatids of the Erechtheum which have been so long set up at St. Pancras, without affecting the orthodoxy of the congregation. The conventional ornament is not more harmless.

In whatever way it is considered, Greek sculpture will be found to be a production of men to whom the art was not what it is to us. As a consequence it may be said to be inimitable. During the whole of our era there was no greater sculptor than MICHEL ANGELO; but where is the work by him which has the Greek spirit? His figures of *Moses*, *Dawn*, *Night*, and *Julien de Medici* are most vigorous, and might have been wrought by the hand of a giant; but they are inspired by thoughts which would be incomprehensible to a Greek. The value of his productions is not lessened because they are not imitations of earlier work, and if MICHEL ANGELO could have had the whole of the Parthenon marbles before him, they would not be advantageous if he lost any of his individuality. Yet after all, can it be said that with all his genius MICHEL ANGELO'S works produced effects among his contemporaries or the people of a later age, which recalled the enthusiasm that arose in Greece? Is it not evident from the records that in his day sculpture did not take so strong a hold on the multitude as painting? The meaning of the colossal figures in San Lorenzo was as doubtful in the sixteenth century as they are in the nineteenth. The great artist believed in allegory, and he may have imagined that all who gazed on his figures would be competent to realise the thoughts which he wished to express under forms that were visible. But the world has grown too busy to spend time on puzzles of that kind, and MICHEL ANGELO'S figures are now treated as if they were only efforts of an ordinary sculptor who was ambitious to display his knowledge of the figure and was ready to sacrifice beauty to vanity. Can we expect that the groups which ALFRED STEVENS introduced in his Wellington Monument will escape a similar fate? There is no question of their power, but however well they are seen in St. Paul's they are likely to be "caviare to the general." It would need a discourse to explain their meaning and appropriateness. When that sort of preparation is requisite there is not much chance that the emotions will be stirred. Put the monument in the most public place of London, and it would not move the blood of a recruit.

The Germans, who know more about psychological mysteries than any people in Europe, do not seek after obscurities in the sculpture which is to be a memorial of their great men. The work of RAUCH in Berlin, which recalls FREDERICK THE GREAT and his time, has as little symbolism about it as an army list. There is the king, with his sharp, unheroic face beneath his commonplace, well-worn, three-cornered hat, and mounted on a trained and serviceable horse that does not stand on its hind legs. There, too, are the marshals and generals who carried out his plans, as well as the civilians who found encouragement from the warrior. Not one of the figures is idealised; they might all be taken from the life. Is not such treatment

preferable as more in relation with manliness than embodiments of courage and truth in female forms? We have never observed man or youth stirred by STEVENS's beautiful work, but we have often witnessed the spontaneous enthusiasm of young German soldiers when they marched by the memorial of Father FRITZ. In sculpture, as in other things, truth is far more effective than fiction. That truth, however, is no easy attainment will be plain to anyone who will compare a photograph of RAUCH's work with the vulgar figures that stand forth as types of the British army on the plain opposite Apsley House.

It is often lamented that in England there is not much patronage for sculpture. As long as the artists endeavour to force upon the public representations of things which centuries back ceased to have interest, they cannot expect that any sacrifices will be made to secure their works. English sculpture is not in touch with modern ideas, and if its production were suspended for years there would be few to regret the change. It must descend from its sham Olympus if the art is to come home to men's bosoms. Vigour, simplicity and truth are needed. Because they can confer ancient names on their works our sculptors imagine they are the successors of the Greeks, although such works as theirs would not be tolerated in any of the purlieus of Athens. There is no doubt that the use of marble has much to do with the delusion which fills so many inferior sculptors with pride, just as rhymesters imagine they are poets when they find they can have their verses printed on superfine paper. It allows, too, of mechanical production and division of labour through which a sculptor's studio becomes a factory. The public are aware of the processes for producing statues, and they know that it is often difficult to point to any part of a costly figure which can be said to be the sculptor's handiwork. Is it any wonder there is so much hesitation about the purchase of statuary?

It would be an advantage on many accounts if the majority of English sculptors were restricted for a time to terra-cotta. That material is not adapted for figures that are more remarkable for prettiness than vigour. It would aid in the production of a robust style. We might expect that by means of it modern subjects they would receive more attention than they do now, for with all the shortcomings of our age it is as fruitful for the sculptor as the painter has found it. The public would also have the satisfaction of feeling that they obtained the genuine work of the sculptor instead of his assistants. After a course of terra-cotta, more expensive materials might then be utilised with better chance of success than seems to be likely under the existing conditions, which, unhappily, combine to make of sculpture a sort of art that cannot be taken seriously by artists or patrons.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, Mr. H. O. Cresswell, president, in the chair.

Mr. H. F. Waring and Mr. T. H. Bell were elected members.

It was announced that the Clothworkers' Company had made a present of 50*l.* to the general fund. A vote of thanks, coupled with the name of Mr. Wyatt Papworth, was passed to the Clothworkers' Company for their gift.

Mr. C. J. TAIT, of Exeter, then read the following paper on

The Value of Criticism.

It is at least ten years, longer than I care to say, since it was my privilege as a student to form part of an audience at the fortnightly lectures of this Association. The completion of a decade is a personal matter of some importance, but viewed more broadly, such a lapse of time is insignificant, for we remember the magnitude of the quest upon which we are all bound. Thus it certainly does not warrant my appearance before you as seer or prophet; and indeed I venture to think that this is hardly demanded by an association of students. I will therefore ask you to listen to me as a fellow student, who a little older perhaps than many of you, ventures to address you upon a matter which must be a subject of importance to us all, and especially during those years which immediately succeed that period of training for which this Association was formed. It was said of the Sophists that they believed themselves to be imparting education, whereas they were only imparting results, and the same is true in a greater or

less degree of all elementary teaching. Early years of training must be largely occupied in acquiring fact and information, and that at second-hand. And this means is very valuable. It is a speedy method of finding out what we do and what we do not want to learn. To this end the teaching of the Association has been greatly enlarged since my time. A feast of endless courses has been provided, and my advice to you would be to systematically try them all. Your several powers of digestion will soon reveal to you your capacities of assimilation, and it is when this knowledge comes to you that the true period of education—the leading out of what is within you—commences. For at this point a new and important factor comes into operation, namely, the colouring of your knowledge by your own particular individuality. So long as you are conscious of learning only what must or should be acquired, there is no response from the living, sensuous side of your nature. But when you have discovered what those studies and pursuits are that train and excite a way of regarding things peculiar to your nature or kindred natures, you are entering upon that critical state which will thenceforth dictate the appreciations and depreciations of your life. What we mean by criticism, then, is the expression of a judgment formed by the union of knowledge and self; knowledge alone constitutes a mere inventory, and self alone evokes but an expression of opinion.

For this process of thought, the union of knowledge with self, the Greeks had a name that is more expressive than any exacting definition—imaginative reason. Such a state you will find may be reinforced by all manner of knowledge and experience, for the individual quality forms the necessary link between things that are by themselves unrelated. And this relative knowledge is of the utmost value, for it is reliable when specific information is not available. It is like good money, which will pass current in all countries, irrespective of nationality, while it further permits you to approach, a subject from many different sides, a power, if I may put it so, which enables you to model thought rather than depict it in a linear manner from one point of view only. How we shall train and direct this imaginative reason is surely a question of the utmost importance, for if our natural temperament, which we have elected dictator, love well but not too wisely, we may readily fall into bad habits and acquire a fatal moral or intellectual squint. This question Matthew Arnold has answered so truly and so shortly that I will ask you to accept his advice. We are to know the best that has been done in the world if we would be critics.

It is clear, I think, from what I have said, that I do not propose speaking of the professional critic, of whom it has been written that he will be chiefly remembered by what he has failed to understand. The intelligent craftsman who writes for the limited sphere of his own craft belongs to a remnant insufficient for the general salvation. It was Mr. Toots who spent so much of his time in writing letters to himself, and it is the public who addresses the public in that class of literature upon which the general taste is formed. The interpretative power must be in ourselves and ready to hand. We must each one of us know the best that has been done, and to know this best for two reasons, that it may correct a wrong estimate of the importance of ideas, and also create a current of ideas that are true and fresh. This high standard upon which we are to model our judgment is of especial value, since it saves our self from merging into mere egotism. By it we are brought rather into agreement with our fellows than into antagonism, for most things contain something of the best which renders them worthy. A dewdrop may appear insignificant to us until we remember that it is fashioned by the same laws that form the spheres.

Let us now look back upon architecture, that for our guidance we may regard the best that has been done. And we shall find in doing so that just as criticism is a union of knowledge with self, so architecture, and indeed all creative work, is a union of self with some quality or other. In this way the subject of inquiry and the method of inquiry will often help to explain each other. By knowledge I do not mean information alone derived from books. The Greeks, who have given us our modern ideas, had no books, and deprecated all written thought, since it limited those powers of expression which conversation gave such opportunities to. They rather perceived fact, as some blind folk are said to be aware of a blank wall before them without touching it. We shall see, I think, in the outset that architecture divides itself into two groups, to take a proper estimate of which an important claim is at once made upon our critical faculty, viz. the capacity to differentiate between the communicable and the incommunicable. Many types of art of which Greek art is the completion have reached the forms they present to us by gradual evolution.

The original germ of these forms is known, just as the derivations of a language are known, and by tacit consent these forms have been accepted universally as the fit expression of certain universal ideas. These forms are, therefore, capable of interpretation—communicable just as a language is. On the other hand, that style of architecture which succeeded the

Greek, viz. Gothic architecture, is largely incommunicable; the spirit of it is entirely so by reason of its forms and characteristics not being the result of a general consent; but, on the contrary, the will of the individual artist predominates. It has, for instance, been pointed out how dangerous a model Shakespeare is to the young poet by reason of the personality which pervades and colours his style. The same may be said of all the finest art of the Mediæval and Middle Ages. It will be my purpose now to provide some material towards the building up of these two great types, from which each one of us may fashion as he will what to him befits the immortal.

To ideas which are communicable I give the name of metaphysics, and the incommunicable I call caprice; and it is out of the strange and wonderful admixture of these elements that architecture is born. "The best physician is also a philosopher," said a wise man; and Mr. Ruskin has lately told us that the best architect is also a metaphysician. Now, what are metaphysics? We will take as an instance what Professor Huxley calls the metaphysics of sensation. He describes how we perceive a rose to be scented by reason of certain particles of the flower impinging upon a sensitive organ. The effect is translated along the nerve fibres until it reaches the sensorium, that portion of the brain which is related to the excited nerve. This operation, as far as the sensitive organ is physical, belongs to physics, and its action can be demonstrated; beyond this point the operation belongs, he declares, to metaphysics, and its character is not capable of demonstration. One knows the result, and that is all. It is the same with the point in question. The applications of certain natural and physical laws are devoted to the development of certain architectural results. The nature of the forces employed is known and can be demonstrated. How and at what stage they cease to be forces and become architecture, and yield us pleasure, as the scent of a rose yields us pleasure, cannot be demonstrated. Yet these forces and their architectural resultant are clearly so nearly related to each other, that we may learn much about the latter by an understanding of the physical laws at work, and that physical condition, which is of first importance, and shows itself throughout the whole of Greek art, is rhythm. We find this element not alone in ornament, as set forth in beads, recurring rosettes, and such like examples which are common to all decorative epochs, but we also recognise it as the keynote of all Greek masterpieces. The drama, for instance, is derived from the rhythmic dance, performed at such seasons of the year as were important in the lives of vine plants, when, at the feast of Dionysos, a chorus of fluting dancers was headed by the wine god. To this dance came to be added a dialogue between the god and the leader of the chorus, and so by the introduction of further dialogue did the drama grow. But the rhythmic element was never absent. The verse is now leaping, now flowing like a stream, and now caught up by the chorus and whipped into a tempest of passion as the dancers swayed their procession through the orchestra.

In sculpture it is the same. An early frieze shows us processions of identical figures or beasts which are rhythmical by reason of their repetition. Then the action becomes more complicated, and pause and motion succeed and interweave with each other, its effect becoming heightened by its intricacy.

In the later drama, the exigencies of plot shrouded much of this constructive element, as in later sculpture the ethic school gave way to the pathetic, and the breadth of the grand style became lost amid pictorial effect, but in the best time of both the drama and sculpture the architectonic of each was of prime importance.

In these fields did rhythm manifest itself with a greater ease than was displayed by architecture of a similar period. Architecture is a fugue upon forces, and these forces had to be overcome or assimilated before a kindred freedom could declare itself.

Rhythm, I need not tell you, is an ever-present phenomenon of nature. No force acts continuously, but in leaps and bounds. You will be conscious of this when you put a stick in a running stream, and the stick beats in your hand. Our own organism is dual and not singular, while physiologists will tell you that our nerve force proceeds in jumps, and is not continuous. This property of forces at once presented a decorative aspect to the Greek mind, and was expressed in their architecture by the play of action and reaction. Thus, to have so disposed the weight in their buildings as to dissipate a portion of the thrust laterally, as by a flying buttress, would have been a violation of this rhythmic sense. It is fully evident that the arch was at their disposal had they chosen to adopt it, but its use must have broken this cherished beat in their buildings. Ornament is regularly recurrent, and it is never sought to vary its monotony. This restrictive faculty is unquestionably limiting to imaginative purpose, and the Gothic builders, feeling this, varied the detail of their repeating ornament, and produced a harmony of forces by interweaving their thrusts. Harmonies of this kind the Greeks never aimed at. It necessitated a want of due balance in one direction or another, abhorrent to their sense of measure. Their conception of ordered motion was

that of a star revolving round a sun, and not the course of a comet, which approaches from and disappears into space. Such an apparent dissipation of energy would have been an æsthetic blunder. Concessions to truth which later ages have been willing to make is aptly illustrated by musical tones, which in the Greek scale were in true and perfect intervals, but which for the purpose of obtaining harmonies—that is, the striking of two notes together without discord—have been artificially rendered imperfect in their interval.

While all architecture is, as I say, a fugue upon forces, Greek architecture is pre-eminently a fugue upon the conservation of force, in the working out of which proportion and symmetry are evolved.

Proportion is simply another aspect of rhythm; it is the relation that one mass bears to another. If the attraction of one prove too great in a building, then that building is out of proportion, or since the area upon which the building stands forms one of the masses to be taken into account, if this area be overloaded or underloaded, the rhythmic reaction is inaccurate, and the whole block conveys a sense of disproportion.

Any building crowded round by houses is thus always at a disadvantage proportionately, for you are unable to appreciate the area upon which it stands. Symmetry is but rhythm marshalled into order, and the rhythm of parts arranged towards the production of a total effect. A crystal or a flower are very evident examples. The relation of the entablature to the columns is proportion, that is, the weight carried to the reacting support. The relation of a number of such instances as they together form a whole becomes symmetry, the final step. These effects produce the typical Classical temple style, and it is to these that the sculptor adds, if sculpture be employed, a fresh element in bias. Proportion and symmetry complete an arrangement of forces at rest. Bias or direction belongs to forces in motion, yet still in equilibrium. It is surplus force, and we see its action in the movement of a star when it moves round a sun by reason of the surplus force which it evolves. It shows itself in a subtle, if unpronounced way, in the profile of mouldings and in the ornaments painted or carved upon them. The cyma is a moulding leaping in its form, and is typically the crowning line of a structure. It is as vigorous as some flamboyant poppyhead cresting, allowance being made for the fact that its function is horizontal as well as vertical.

The echinus, which exactly resembles a claw, possesses the gripping and supporting outline, and there is no sense of dissipation marked in its profile as in that of the cyma, but rather the force expressed in its outline returns upon itself.

The ornament, again, which is painted upon the cyma, is the upward clustering honeysuckle, while that upon the echinus is the egg and dart which graphically explains the feeling of the moulding. These are plays of detail which impart freedom within the strict limits of architectural line, but it is in the sculptural frieze and pediments that a more unreserved freedom is to be sought. Yet it is not the freedom of caprice. Its laws are very definite; indeed the sculptor could not have dared the flights he essayed had he not thoroughly known his limitations. In the Parthenon frieze we find what is but a neutral band made to serve a very definite purpose. By reason of the slowly-moving procession sculptured upon it, diverging in two lines from the centre of the west front, the interest of the spectator is conducted to the entrance situated in the east or principal front. Individually the figures of horses and riders or maidens may be observed to be in perfect equilibrium, and could move backwards as readily as they could forwards.

But the long column of processionists heading in one direction produces its effect, and a steady and balanced tendency is directed towards the focus of the situation, where the dramatic scene of Athené's birth is being enacted. Here, in the east pediment, what we find is not a mere pictorial rendering of the event, or what might be supposed to be the conditions of such an event, any more than the frieze actually represents the Pan-athenaic procession, with its ship bearing the floating peplos, which was so evident a feature in the scene. The figures of the pedimental composition are equally chosen for architectural effect, and the fact that the groups are turned from the centre of interest when viewed merely pictorially has led to all manner of conjecture as to whether they are gods or mortals, symbolisms, or what not. Viewed architecturally, however, it is evident I think, that since the raking lines of the cornice must be counter-balanced, the action of the figures must be from the centre outwards. The effect of this grouping is so important that it cannot be allowed to be an accident of composition. The strength thus added to the building lines is seen at once in comparison with such examples where the direction is inwards, as on the Temple of Zeus at Olympia, or Athené at Ægina.

The sculptures at Ægina are elementary and tentative, while those at Olympia are careless in their execution. The keynote of the Parthenon, however, is the absolute completeness displayed in both the conception and finish of its detail, and the evidence of intention which is observable in every line of it. The forces suggested by the raking lines of the cornice must

meet and drop, and although translated into the new medium of pictorial line, the action continues one with the architecture, and the scattered vigour directed towards the angles is caught up again by the architectural lines.

The Parthenon frieze and pediment sculpture are the example of what I take architectural sculpture to be. It is not embellishment calculated to give effect to an otherwise bald and inexpressive production, as sculptors have lately given us to understand. It is architecture transposed if you will, or its musical score arranged for another instrument. There is no reason to suppose that these masterpieces were executed by other than skilled masons. Architectural sculpture and sculpture proper were two perfectly distinct trades with the Greeks.

The sculptor of the Phigalian frieze was the architect Ictinos, and Pythias, the architect of the Mausoleum, executed the famous chariot group. Pheidias, as comptroller of works, doubtless picked his men, and these men were moreover Athenians, and not provincial. Pheidias is a household word among us, but we know nothing individually about him, save that he died in prison, and his contemporary Myron in much poverty. Of the studio ghosts who must have worked these wonderful marbles we know absolutely nothing, much to their credit as artists.

Mr. Brett, when discussing architecture from a painter's point of view, hinted that she was far too ready to accept help from the allied arts, and he would like to see her rather express her whole self and nothing but herself. And such a sentiment is most corrective. There is too much stress laid upon the so-called unity of the arts, and the justification for it is, I think, not conclusive. Painters have been in the first place painters of easel pictures, and sculptors have been creators for dedication and portraiture in all periods, and when for an exception Raphael left his Madonnas to paint academic proprieties in the Vatican, or Tintoret placed his precious work where it cannot possibly be seen. Such result of co-operation is at least open to remark. And we should further note this, that as the painter and the sculptor came to the front, architectural painting and architectural sculpture went to the wall. From the gossip that hangs around the lives of painters like Zeuxis and Apollodorus, or the sculptor Lysippos, we may judge that their free and popular treatment produced a far greater impression than the grand style of the painter Polygnotos, the decorator of the Theseum, or of the unknown Pheidian sculptors who wrought the Parthenon-frieze.

As a matter of fact, the Greeks exercised a rigid distinction, and did not include architecture among the liberal arts (*ἐλευθέριαι τέχναι*) where they placed painting and sculpture, but among the useful arts which we now call the crafts.

Sculpture gradually became an embellishment as applied to architecture, as it continues to be, and as folk seem satisfied that it should remain. It is you architects who can revive its old feeling, if it may be done at all, and to this end you should know the figure sufficiently to enable you to make details of your sculpture where you employ it, as you would for any other portion of your design. While you may work from the life you should more particularly study the best sculpture itself, for we learn art from art and not from nature, who is our inspirer and not our master. There is yet another quality which we may notice and the value of which we may appreciate from the study of Greek work, prompted as it was by the nation's acute perception of what is due even to the materials employed. The history of sculpture especially shows us that the early years of artistic activity were directed to acquiring a knowledge of material. The Parthenon marbles are among the first examples to testify to this power over material having been obtained.

In the metopes this struggle is still either intentionally or otherwise apparent, and these, like the Aeginetan sculpture, possess that woodiness which fitly expressed the Dædaleon or Wooden Age. The large surfaces and the sharpness of detail which fine sculpture shows us are demanded by marble. In the Olympian sculptures, which immediately precede the Pheidian, they had arrived at the large surfaces but not the sharpness of treatment. In examples immediately succeeding that age largeness of surface showed evidences of being undervalued, and sharpness exaggerated into flicker, as in the detail of Niké Apteros.

These considerations, then, are some of the metaphysics of architecture. I have traced them as far as I am entitled to; their effects as architecture I must leave you to evolve and to admire. Let me conclude a review of these considerations by pointing out that I have avoided any suggestion that these elements were derived from the contemplation of natural phenomena, as flowers, the seasons, tides, and so forth. This may or may not have been their origin. It should be sufficient for us that we ourselves are a part of nature, and her laws and methods intervene in our lives equally as in the life around us. We are expressing ourselves when we employ these laws and methods as a language, and this is the function of art.

Although nearly everything which we now value has been

bequeathed to us from the Greeks, Greek art, as a concrete expression, died in the third century before Christ. We are still influenced by its suggestions, but not by the unity of its life. A new spirit, demanding new expression, sprang up with the Roman civilisation, which reached its full development in Mediæval times, and this spirit was the popular spirit. In art pure and simple the Romans had no facility of expression, and they borrowed the clothing of their buildings from the Greeks. It was Greek art, with the art left out.

In this direction, then, we can learn nothing from Rome. The prophet returned an evasive answer when asked, "Can these bones live?"—an Eastern habit, probably constitutional with him. We need be guilty of no evasion. Roman detail expresses nothing; and I am afraid it is, for that reason, only too serviceable—when you have nothing to express.

From the decline and fall of Rome we may seek warning, but not inspiration. The life of Rome, which has given us her great laws, lay in her people, and it was to the fulfilment of the popular life that we owe the legacy bequeathed to architectural style, for her baths, public buildings and halls of justice provide us with plans upon which the architecture of our own time is modelled. An agreement had taken place, as I have said, in ancient buildings, as to the fittest expression of certain paramount ideas. But on turning to the succeeding periods we find no such agreement. The individual, and not the collective perception is supreme; and such perceptiveness is formed of such infinite variety that we can only recognise it as the element known as individuality or caprice. Such a characteristic was unknown to older civilisations, where despotism ordained and coloured everything, as in Egypt, Assyria, and even Greece. The flexibility of Greek ideas, so evident in all they touched, never bent themselves to the claims of the individual. The Republic of Plato leaves him out in the cold, since his intrusion—possibly unwashed and unclothed—into a society which was to be of such unblemished respectability, that had its members been other than Greeks it must have been most unmitigatingly dull, could not be entertained by even the most advanced philosophy. Yet this sentiment doubtless saved her artists and kept them pure. Their life was in the workshop; they were regarded as tradesmen, and society left them unspoiled by its follies. It was the little band dwelling amongst the Lagoons of the Adriatic whom King Pepin tried to drive into the sea, and who afterwards became the great Venetian Republic that set the true note from which Mediæval art sprung. By her sea trade with Byzantine she became a repository of such arts as had descended from Athens and Rome, and under this influence built the most notable Western building of that time. How is criticism to help us here, where precedent is derided, and where the interests of common life on sea and land, usurp the sovereignty of ideas—in this changed state from law to caprice—from what is by nature communicable to what is by nature incommunicable? It is here that related knowledge becomes so serviceable. It enables us to look round and behind the capricious element, to catch it by the difference of treatment, perhaps, in architecture and poetry, but especially by an understanding of the life that lay at the back of that which is interesting to us, the life of the man and of the moment. By this means we may augment the volume of the song as the body of a viol augments the vibrations of the strings.

And this brings us very near the "poetry of architecture." The Italian cottage, with its white walls cresting the olive terraces, bosomed in grey and domed in blue, is indivisibly one with its scene. And were time able to touch it in its seclusion, as it touches the busier homes of men, it would in like manner belong to its time also. It is in this way that we may regard the creations of bygone days, and so augment the impression they make upon us. The tower of the Signori at Florence rears itself the straighter and dominates us with a sense of gathered power, when we hear the clash of its bell calling the citizens to arms, while its echo is answered by the hurry of feet and murmur of voices from the thronging piazza beneath. Or to speak of presences which are nearer to us, and which, as they keep audible silence in the midst of a city's cries, may tell us the eager story of their lives if we will stay and listen awhile. Our cathedrals tell us of days when they formed a shelter to the people who dwelt at the foot of their high walls, a hospitality shared with the homestead itself. For folks did not lead two lives. The kindly gossiping monk went in and out of their doors carrying with him the common interests of the day along with creed and benison.

The records of the religious or social guilds, for we are unable to distinguish a difference, describe this life for us. To such a guild, dedicated to one or more saints, all were admissible, man and woman, priest and layman, so long as he or she be of good report. Provision for decent burial with candles and night watches, feasts, services and processions on guild days, once, twice or thrice in the year as might be, ministered to the devotional element. The relief of the poor, loans on surety, even free loans to assist the young to obtain work, dowries to good girls of the guild, assistance to brethren imprisoned, hospitals for poor strangers, free schools, these and

many more kindly and social works did these guilds undertake.

I cannot refrain from quoting to you a portion of the ordinance from the return or deed of the Guild of St. Christopher, Norwich, of the fourteenth century. It opens with a prayer for the Holy Church, for peace, pope, cardinals, patriarch, Holy Land, archbishops, bishops, parsons, king, queen, dukes, earls, barons, bachelors, knights, squires, citizens, burgesses, franklins, and continues on behalf of all true tillers and men of craft, widows, maidens, wives, and for all the commonalty and christian people; for all true shipmen and true pilgrims that they may safely come and go; for the fruits of the land and of the sea; for brothers and sisters of the guild, and all christian souls, Amen. One beholds the same social unity in the Canterbury Pilgrimage. We have the same folk that have just been remembered in prayer. The friar, the nun, the poor parson, the knight, the shipman, the yeoman riding together merrily and unreservedly.

It was from the hands of the true craftsman prayed for, conjointly with bishops and prelates, that our great churches have grown. With this binding together of all classes, one is not surprised at a great unified type of architecture springing up, nor a spirit of gentleness and devotion, one with the lives and homes of the true craftsman, manifesting itself in a devotional and homely manner upon the graceful detail. Thus we find the quaint and grotesque carved on boss and corbel, and a delightful innocence and freedom displayed in the intersection of mouldings, while the cresting pinnacle, with its eager clamoring leaves, from beneath which laughs some elfish countenance, tells the delight of the conquering hand that raised it. In this spirit may the critic linger in our cathedrals. He must not tell us that these pinnacles are the prototype of the flag-staffs which Egypt lashed to her pylons. It may be a fact, but it is a fact that bears not a ray of expression upon its face. Gothic architecture rather wears, like Wordsworth's mistress,

A countenance in which did meet
Sweet records, promises as sweet.

And one is veritably nearer to its spirit in verse than in anything else. We have, in conclusion, the second value of criticism to consider—that it has the power to create new and fresh ideas, to furnish an atmosphere when our surrounding conditions are against us, in which we can best work. I will not go so far as does a modern author, who declares that everything that concerns us in the present is inconvertible into art, and that it is precisely because Hecuba was nothing to anybody that she forms so suitable a centre for tragic motif. On the other hand, the statue of an heroic policeman lately erected in Chicago, which suggests to us more than anything our old friend demanding who stole the sausages, may well, if I may borrow the descriptive Transatlantic language, take the cake as an experiment in modern inspiration. Yet beneath the hideous veneer of modern life the passions surely are there which created and moved through Greek drama, and which Shakespeare worked into his material. But while we have to mine for them, these ideas and passions were then in the air. Listen, quoths a modern seer—"there never was an artistic age." Truly not. A shipman upon the Piræus knew no more about art than did Queen Elizabeth's turnspit, nor either of them more than a sixth standard school-boy to-day. But they knew more of the passions and ideas out of which art is made. So far, then, Mr. Oscar Wilde is right. We must turn to days such as these for inspiration, for we shall not find it in the interests which surround us. In saying this I do not propose, like Mr. Gilbert's hero, "to be eloquent in praise of the very dull old days that have long since passed away." Every man belongs to his time. But I would urge that we cannot expect to have our cake and eat it. We cannot hope to be famous for everything, and just now we are famous for commercialism and common sense, both inimical to art. By common sense let me explain that I mean what Mr. Ruskin doubtless does, when he declares it to be no sense at all, a condition of mind which is chiefly remarkable by an inability to see the incongruous, whereas to coax congruities out of incongruities, with just a flavour of the incongruous left on, forms one of the first lessons in art. Yet if we are to push our craft and carry our mission into the enemy's land, it is most necessary to have some acquaintance with commercial methods.

Further, since function is an indispensable element in architecture, one indeed which distinguishes it as a so-called useful art from an imitative one, the inarticulate wants of an inarticulate age have to be mastered and marshalled before there is any hope of clothing them with architectural effect. It is function which dictates in the rough the shape of everything as we see it—for instance, in a spoon, a pin or a ship—and function it was which planned a Gothic cathedral and a Greek temple. In contrast to these simple types let us picture to ourselves the function of a modern hall of justice, with its cloud of witnesses, its judge, jury, counsellors and prisoners, with a myriad untold minions of the law, all demanding twice the accommodation they want or expect to get. But they will require some semblance of their wishes being met, and it would

be no good presenting them with a design for a basilica, and tell them to fit it up with pens for themselves. To meet what are considered to be modern requirements an architect must possess no mean organising power. Also we must remember that we are not like the sculptor and the painter, who execute their own work. We have to employ others, or get somebody else to employ them, if we would see our creations grow into life; and to get this much done requires all the tact of which we are capable. These faculties cannot be neglected, and yet we must always remember that they are but the servants of our craft, who is our mistress.

We are to-day in an age of transition from one of authority and pedantry towards one where the freedom of the individual largely enters. A hundred years ago Stuart and Revett's book set a fashion which kept its head above water into the first half of the century, when the Gothic revival finally swamped it. There is a fine touch of melancholy about these Stuart buildings, as though erected in memory of an art impossible to revive; and I always think of the architects as very silent gentlemen in black, wearing weepers and undermined by grief. They, at least, made little stand against the robust Goths when prosecuting their second invasion. These brought back with them the old sense of freedom, but marred by eclecticism. They were so horribly afraid of doing what was wrong that they were always doing it, as is the custom with excessive virtue. The low-pitched roofs of the fifteenth century came off wherever they were found, and the ghostly traces of a high pitch were sought for upon every tower. In us the new spirit of freedom has gained power, and the accumulated reaction against the pedantry of both modern Greek and modern Goth is inclined sometimes, perhaps, to make us break bounds. Therefore we should not be unmindful of the old Greek restraint, a quality always present in fine art. Caprice without reasonableness appeals only to one part of our nature, and without its restraining power we lose a nice sense of the fitness of things.

Laws which we have seen paramount in Greek architecture are paramount to-day, and a musician who cannot evolve a fugue from some given phrase, or a sonata from certain melodies, is very naturally disqualified by his *confrères*. Happy is the young architect who from rhythm and the developments of rhythm early discovers himself to be unable to construct in obedience to the laws that govern these qualities, for the profession of millionaire is still open to him.

This Association possesses unrivalled opportunities for assisting in such a discovery, and it might well include among its parental duties a quorum of fathers who should communicate this advice to a young son, both for their own sake and for that of the craft whose reputation we have in keeping. And for the rest of us, let us familiarise ourselves with such things as are of good report, that our efforts may not be in vain.

An age has never been so full of endeavours as this that can never bear fruit and come to perfection, and chiefly for want of direction. Happily for us, we had our infant complaints so badly and so universally in the Greek and Gothic movement, that we have no sickness on us to compare with the epidemic of Ibsen and Anglo-French painting. There is, I venture to think, a better all round excellence of work done in architecture than in any of the other arts. Perhaps for this reason there is not that brilliancy and distinction in our work that belongs to individual groups in other lines of creative effort. A modern impulse is distinctly evident in those fields where the poets Arnold and Rossetti, and the sculptor, Alfred Stevens, left their mark. One could only wish that the painters George Mason and Fred Walker were equally well remembered.

And in architecture we have our influences, for Burges, E. W. Godwin and Sedding should be no mere names. What I think should be most desired by us is that some common-sense should invade our work, which would not mean monotony of style, since there would be no agreement as regards expression, wherein, I may remind you, lies the stumbling-block of academies.

It is where two or three are gathered together that enthusiasm burns, and a guild or association of students thus holds latent immense possibilities. Our time is especially for the young, in spite of the anxiety of our parents as to what they shall do with their sons. Well directed effort is no longer decried as innovation. It is towards a right direction of effort that criticism tends, and giving to this quality its due weight, it is for us to go forward.

Mr. LEONARD STOKES proposed a vote of thanks to Mr. Tait for his paper. Mr. Stokes expressed his opinion that Greek art was tied down more by rule than Gothic, and therefore was not so high a form of art. Art threw rules to the wind. Greek art was for study, to see what to avoid as well as what to develop. It was also more of a style from which to crib. Simple buildings that depended on proportion were often more satisfactory than ornamental buildings. In the same way, as regarded function, it was rare to see a ship or even a locomotive that had not its own style of beauty.

Mr. MOUNTFORD seconded the vote, and urged the necessity of restraint in design instead of trying to get all one

knew into a building. He thought Mr. Tait deserved their thanks for coming so far to read his paper to them.

Mr. GOLDSMITH remarked that he did not agree with Mr. Stokes in considering Greek a cut-and-dried style. It seemed to him that there was as much elasticity in Greek as in Gothic style.

Mr. COLLARD and Mr. PRYCE supported the vote.

The PRESIDENT having put the vote to the meeting, Mr. Tait replied briefly, and recalling that he had said, describing Greek as communicable and Gothic as incommunicable, said he gave the highest place to Gothic.

TESSERÆ.

Painters and Scenery.

WHY is it that usually what we term beautiful scenery was seldom the ground of the old painters? They were not, generally speaking, painters of views; and why not? There the pictures were made for them. They and all the world had the thing before them to love and to admire—it was already done; there was no room for their genius, which is a creative, not an imitative, faculty. The scene for every eye was not theirs. They found that by their art they could take nature's best feeling even from her fragments. It requires not an alp to portray grandeur. Fifty feet of rock, precipitous or superimposing, will better represent the greatness of danger, for it is a more immediate and solid mass to crush the intruder, and the form may frown with a demon malice. The whole awe of darkness may be felt in a cavern of a few feet space. Indeed it may be almost said that largeness is not to be obtained on the canvas by the largeness of whole extensive scenes in nature, but by the continuous lines of near masses; whatever is actually largest in nature—the forest and the mountain—in art may with advantage occupy the smallest space. For the best magnitude here is in perspective, and in that aerial tone which, as a veil, half conceals, and thereby makes mysterious, and converts into one azure whole the parts which would otherwise be seen, but break up the great character. The Arabian genii were greatest when dimly seen through smoke and vapour. Art, indeed, differs from nature in this as regards the pleasure derived through the eye, that nature allows you many unperceptive views at many instant glances, and therefore surprises us with a sort of perspective impossibility, of which the judgment at the time is not cognisant, whereas art is bounded by a rule, looks not all around, and comprehends by mind beyond the eye, but is constrained to frame in the conception. It must, therefore, make to itself another power, and this power it finds in form, in light and shade and colour, all which are in greater intensity and force in the fragmentary parts than in the whole and large scenes. It is a step for the young artist to believe that art and nature are not and should not be the same—that they are essentially different, and use their materials differently, have other rules of space and largeness. If art be more limited its power is greater by being more condensed—with its impressions more certain, because more direct, and not under the vague and changeable process of making an idea from many perspectives.

Ancient Roman Easements.

In Roman law there were two sorts of Prædial Servitudes or easements, viz. Urbanæ and Rusticæ. The former related to edifices, the latter to land. The following are the principal Servitudes Urbanæ:—1. *Oneris ferendi*, or the right which a man has to use the edifice or wall of his neighbour to support his own edifice. The owner of the servient property was consequently bound to keep it in repair, so that it should be adequate to discharge its duty. 2. *Tigni immittendi*, or the right of planting a beam in or upon a neighbour's wall. 3. *Proiciendi*, or the right of adding something to a man's edifice, though it shall project into the open space which is above his neighbour's grounds. 4. *Stillicidii*, or *fluminis recipiendi* or *immittendi*. This servitus was either a right which a man had for the rain-water to run from his house upon and through his neighbour's premises, or a right to draw such water from his neighbour's premises to his own. The technical meaning of *Stillicidium* is rain in drops; when collected in a flowing body it is *Flumen*. 5. *Altius non tollendi*, or the duty which a man owed not to build his house higher than its present elevation, or the duty of the owner of a piece of land not to raise his edifice above a certain height, in order that the owner of some other house might have the advantage of such forbearance. If a man was released from this duty by his neighbour, he obtained a new right, which was the *Jus altius tollendi*. In like manner a man whose ground was released from the *Servitus stillicidii* was said to have the *Servitus stillicidii non recipiendi*. This was not strictly accurate language, for if a *Servitus* is defined to be some limitation of the usual rights of ownership, a recovery of these rights or a release from the duties which is implied by the possession of these rights by another, merely gives the complete exercise of ownership, and so destroys all

notions of a *Servitus*. Still, such was the language of the Roman jurists, and accordingly we find enumerated among the *Urbanæ Servitudes*, "*Stillicidium avertendi in tectum vel aream vicini aut non avertendi*." 7. *Servitus ne luminibus* (and *ne prospectui*) *officiatur*, or the duty which a man owes to his neighbour's land not to obstruct his light or his prospect, and *Servitus luminum* or *prospectus*, or the duty of a man to allow his neighbour to make openings into his premises, as in a common wall, for instance, to get light or a prospect. It was a *Servitus* the object of which was to procure light, whereas the *Ne officiat* was to prevent the destroying of light. But there are different opinions as to the meaning of *Servitus luminum*. 8. *Servitus stercolinii*, or the right of placing dung against a neighbour's wall, &c. 9. *Servitus fumi immittendi*, or the right of sending one's smoke through a neighbour's chimney.

The Precious Metals in Art.

The addition to their wealth which was derived from the scarcity of gold and silver by the affluent led to a rapid and most important increase in the consumption of those metals in articles of luxury. Gold and silver plate, jewels and other ornaments set in gold became general among the richer classes, and to an extent unprecedented since the fall of the Roman Empire. Gilding was employed so much in furniture, the frames of pictures, the roofs of rooms, carriages and other articles of state or show as to withdraw a considerable part of that most precious of the precious metals from the monetary circulation. The scarcer gold and silver became, the more was this direction of a large portion of it increased, because the richer did the fortunate few who possessed amassed capital become from the daily decline in the price of all other articles of merchandise. This effect was most conspicuous in ancient Rome in its latter days, where, while the armies dwindled into cohorts from the impossibility of finding funds to pay them in large numbers, and the fields of Italy became desolate from the impossibility of obtaining a remunerating price for their produce, the gold and silver vases, statues and ornaments amassed in the hands of the wealthy patricians in Rome, Constantinople, Alexandria and the other great cities of the empire, so prodigiously increased, that, with the currency, which formed but a small part of its amount, their value is estimated by Gibbon at the almost incredible amount of 350,000,000*l.* sterling.

Inigo Jones and Palladio.

On the occasion of his second visit to Italy, Inigo Jones took books of authority with him, and made memoranda wherever he went. His copy of Palladio (the folio edition of 1601), preserved at Worcester College, Oxford, contains an entry dated "Vicenza, Mundaie, the 23rd of September, 1613," and one of his sketch-books (a thin octavo in a parchment cover, with green strings, now in the possession of the Duke of Devonshire) exhibits his name on the fly-leaf, with "Roma, 1614," written in his fine, bold hand beneath it. The copy of Palladio is as rich with notes in Inigo's handwriting as the Langbaine, in the British Museum, is with the notes of Oldys. One of his entries commences thus:—"In the name of God, Amen. The 2 of January, 1614, I being in Rome, compared these desines following with the Ruines themselves. Inigo Jones." At folio 64 he has written, "The staires at Chambord I saw, being in France, and there are but 2 ways to ascend, y^e small hath a waal, w^h windowes cut out, but this, y^e seems, was discoursed to Palladio, and he invented of himself thes staires." His Palladio was his inseparable companion wherever he went, and contains the names of Andrea Palladio and Inigo Jones, coupled together in his own handwriting; such was his admiration and such his ambition. At b. iv. p. 41, occurs the following entry:—"The Temple of Jove, vulgarly called frontispicio di Nerone, or a basilica; sum call it a Temple of the Sun, and that is likelyest." The book was with him, as appears from his own entries, at "Tivoli, June 13, 1614;" at "Rome, 1614;" at "Naples, 1614;" at "Vicenza, 13 Aug., 1614;" and at London, "26 January, 1614," *i.e.* 1614-15. Nor did he cease to carry his Palladio about with him even in his progresses in England as surveyor of the works. The following is written on a fly-leaf:—"The length of the great court at Windsour is 350^{fo}, the breadth is 260; this I mesured by paces the 5 of december, 1619. The great court at Theobalds is 159^{fo}, the second court is 110^{fo} square, the thirde court is 88^{fo}—the 20 of June, 1621. The front of Northampton Ho. is 162^{fo}, the court is 81^{fo}. The first court at Hampton Court is 166^{fo} square. The second fountaine court is 92^{fo} broad and 150^{fo} longe. The Greene Court is 108^{fo} broad and 116^{fo} longe, the walkes or cloysters ar 14^{fo} betwene the walles. September the 28, 1625." Of the Temple of Jove he thus writes, June 13, 1639:—"Clemente scoltor Romano told me that the ruines of this temple is pulld all downe to haue the marble, by the Constable Barbannos Collona, by the popes permission: this was the noblest thinge which was in Rome in my time. So as all the good of the ancients will bee utterly ruined ear longe."

NOTES AND COMMENTS.

A PAPER was read at last week's ordinary meeting of the Society of Arts by Professor HARTLEY of Dublin, which calls for some notice, as a part of it treated of the oils used in painting. The ordinary boiled oil was condemned because (1) it causes a brownish or yellow colour to be communicated to white lead or zinc white; (2) it darkens pigments containing brilliantly coloured metallic sulphides, such as vermilion, cadmium yellow and ultramarine blue; (3) delicate colours are darkened by the oil when exposed to ordinary town air, that is to say, air which is not quite pure; this is the case even when the oils themselves may not injure the paints. The professor (in conjunction with Mr. BLENKINSOP), has a process for preparing drying oils of a pale colour; that is, first refining the oil by the removal of water and mucilage; second, boiling and bleaching the oil at one operation. The prepared oil has been used for decorative house painting for both indoor and outdoor work, on wood and on metal. It has also been used as a coating for iron work without the addition of a pigment. It is claimed that with a pale boiled oil zinc white retains its pure white colour. Delicate tints and colours containing sulphides are not darkened in course of time. For indoor decoration, for painting of ships, railway carriages, railway semaphores, signs and stations, such oil is free from liability to alter the colours with which it is mixed owing to its freedom from lead, which is darkened by traces of sulphuretted hydrogen in the air, to which such paints are exposed. Gasometers in gas-works may be painted an unalterable white with such oil and zinc white. But in this case also the zinc white must be free from lead carbonate or oxide.

ONE of the inconveniences which students of architecture and archæology in Great Britain have to put up with is the loose way in which speakers and writers on ecclesiastical subjects treat the history of church buildings. For doctrinal purposes it may be becoming to ignore facts, in the same way as KATHERINE, after lessons from PETRUCHIO, was willing to declare that day was night and age was youth. We have, happily, nothing to do with that policy. But what we do object to is that buildings which were erected for uses which were rigidly prescribed should be treated as if they were designed for uses which may be said to be opposed to the intentions of the designers. A few days ago we read how a clergyman of the Scottish Episcopal Church, in the course of a speech, said:—"We see around us on all hands great improvements both in Presbyterian architecture, in Presbyterian ritual, and in Presbyterian worship. May I venture to ask who taught our fellow-Christians in Scotland to love the aerial spire and to revel in the exquisite symmetry of the Gothic arch? Who taught them the sweetness of the painted and storeyed window? I think I may say that we have our share in the credit of being the schoolmaster of Scotland in these matters." Now it might be imagined from what was said that the Presbyterians were indebted to the Scottish Episcopalians. If it will be remembered that Sir WALTER SCOTT, who was one of the latter, could describe his co-religionists as forming "the suffering and Episcopal Church of Scotland—the shadow of a shade now, and fortunately so," it must be plain that until comparatively recent years the Episcopalians were not in a position to erect buildings like those which are to be seen in Edinburgh, Inverness and elsewhere. They could not, therefore, possess examples of exquisite symmetry which were worthy of imitation. It will be said that for centuries prior to the establishment of Episcopacy by JAMES I. in 1617 there were such churches. Architects, however, must know that the old churches were not planned for services like those which are now approved, and however politic it may be to appropriate them in theory, some regard ought to be given to history.

ACCORDING to FERGUSSON, the introduction of the use of stone for architectural purposes in India was owing to ASOKA, who reigned from B.C. 272 to 236. The Buddhist sovereign is supposed to have fixed his capital at Palibothra or Patna beside the Ganges. The Bengal Government having ordered the site to be surveyed, a report on the results has been prepared by Major WADDELL. The posi-

tion of the palace has been easily discovered, for it appears it is difficult to sink a well without finding remains of stones that are elaborately carved. In the seventh century a Chinese pilgrim visited Palibothra, and among the wonders he saw there was a stone on which Buddha had left impressions of his feet. Strange to say, a stone still exists on which traces of colossal footprints, that is, 20 inches by 6 inches, are to be observed. For archæologists the parts of large beams of *sal* wood which are excavated by the peasants, will have more interest, for they may have formed part of ASOKA's palace. The Hindus are rather fearful of the wooden fragments. The officers of the Archæological Survey of India have tried to identify Palibothra with another place but without success. It is, therefore, possible that Major WADDELL's discovery will be undervalued by the official world, but on that account it deserves to be followed up by the Bengal Government.

THE Council of the Yorkshire Archæological and Topographical Association have made arrangements for the incorporation of the society. A similar course has been adopted from time to time by many public bodies, and has several advantages, the chief of which is that it gives a society a legal status, and enables it to hold property without the intervention of trustees; and without the consequent difficulties caused by deaths, changes of trustees, &c. The management of the association will also be far better and more clearly defined under the proposed memorandum and articles of association than under the old system, and the powers, rights and privileges of the council and of individual members will be more clearly understood. The council believe that the proposed change will be for the benefit of the association. In 1891 there was a deficit of 20%, while last year's accounts show a balance of 54% to the credit of the association. The annual report also states that the council have adopted the arrangements of the Archæological Society, in union with the Society of Antiquaries, and will issue the index of the archæological papers which appeared during the year 1891. It is impossible to overestimate the value of this publication, which gives the titles of all papers printed in the proceedings of forty-three metropolitan and provincial societies. In the record series one volume has been issued of the "Abstracts of Yorkshire Inquisitions of the Reigns of HENRY III. and EDWARD I.," which has been prepared by Mr. J. A. C. VINCENT. The material for another volume is being prepared by Mr. VINCENT. The second volume of the Selby Coucher Book is nearly ready. Another volume of the index of the York Wills (1554–1568) is in the printer's hands, and will form the first volume for 1893. The first of a series of full abstracts of Royalist composition papers for Yorkshire, which have been prepared at the cost of Mr. J. W. CLAY, will appear during the year. Mr. W. PALEY BAILDON's volume of Monastic Notes, which gives much new and interesting information relating to Yorkshire monastic foundations, will probably form one of the volumes for 1894. The indexing of the York Wills is in the hands of Mr. A. GIBBONS. About half of the special fund provided for indexing purposes has been expended. The Council have during the past year acquired from Mr. H. WHITWAM an Index of Yorkshire Fines for the reign of EDWARD I., and propose to print it in due time. Mr. THOMAS BROOKE, F.S.A., of Huddersfield, has been elected president of the incorporated society.

LOCKWOOD's "Price Book for 1893" has appeared, and is edited, as in past years, by Mr. MILLER. It contains about six hundred pages of closely-printed matter. LAXTON's, which is published by Messrs. KELLY, again contains, in addition to the customary information, abstracts of law cases. Messrs. SPONS' "Price Book" is characterised by an endeavour to condense the items and to save labour in consulting the pages. French contractors must envy their English brethren, who are able to obtain the means of testing prices at so cheap a rate. They have to pay far more for the official prices than the three volumes will cost, and they often find that the figures have little relation to the markets for materials or for labour. The enterprise of the three firms of English publishers has made estimating comparatively an easy operation.

THIS characteristic example of a modern type of country house is by Messrs. DAVIS & EMANUEL. There is no reason why the Australians and Americans should be allowed to monopolise verandahs, which they regard as their property. The plate is from a photograph by Messrs. BEDFORD LEMERE & CO.

ST. FRIDESWIDE'S MISSION-HOUSE, POPLAR.

THE Mission-house and Girls' Club (illustrated this week), situated in the midst of a very poor neighbourhood in the north of the East India Dock Road, have been erected and fitted up at the cost of Miss CATHERINE MARY PHILLIMORE, "in memory of those at rest and in furtherance of the work of the Christ Church Mission." In 1881 the Christ Church (Oxford) Mission commenced working in this neighbourhood, the first priest being the Rev. H. L. PAGET, now vicar of St. Pancras. The buildings then used were cottages which stood on the site of the new Mission-house. The part of the building occupied by the Clewer Sisters is on the west portion of the site, and comprises four storeys. Plans of two of the storeys are given in the illustrations. On the top storey are five dormitories, a work-room, a laundry and a garden. On the lowest storey is a large waiting-room for applicants for assistance and advice; part of this room will be used as a soup-kitchen in the winter. Gas-coppers are provided, raised very little above the floor. This room, and the whole of the kitchen department for the community on the ground storey, are lined with white glazed bricks.

The intention has been to provide everything required for the work of the Mission, without any excess of size in rooms or passages. "The Chapel of the Resurrection" for the use of the residents has been placed at the south-east of the one-pair storey. On the ground-floor the east portion of the site is devoted to rooms for the St. Frideswide's Club and Guild for Girls. There is communication from the interior of the Mission-house to these parts of the building, which is also reached from Duff's Fields. A small complete set of rooms for the donor and a friend, to be used when assisting in the work of the Mission, forms the west portion of the one-pair storey.

The building is heated by low-pressure hot water, the boiler being placed in the basement, and there are radiators in the rooms, passages, staircases, &c. This work has been done by Mr. ROBERT CRANE, of Binfield Road, Clapham. The tiles for the passages, &c., were supplied by Messrs. BOOTE, who have also supplied glazed tiles for dados throughout the building. Messrs. BRADY & THORNBOROUGH fitted up the swivel partitions. Messrs. VAUGHAN & BROWN, of Farringdon Road, supplied the gas fittings, many of them being specially designed for their positions. FAWCETT'S fire-resisting floors are used throughout the ground storey, and floors of wrought-iron and concrete in all passages, &c. elsewhere. The staircases are of solid concrete steps, formed *in situ*, with stone treads. "Silex" brand, Hipperholme stone, supplied by Messrs. J. BROOKE & SONS, has been used for the steps and for all the stone paving. Wood-block floors have been used in a number of the rooms. The lifts are by Messrs. WAYGOOD & Co.; the laundry fittings by Messrs. BRADFORD & Co.; the locks by Messrs. HILL & Co.; the "Teale" stoves by Messrs. EDWARDS & SON; and the Hopton wood chimneypieces mainly by Messrs. KILLER BROTHERS, of Wirksworth. The statue of St. Frideswide, in the niche over the Lodore Street entrance, is by Mr. FORSYTH.

The building was carried up to the ground level by Mr. J. K. COLEMAN, builder, of 120 High Street, Poplar. Messrs. SMITH & SONS, of Norwood Junction, obtained the contract for the superstructure, and have also carried out fittings specially designed for every portion of the buildings by Messrs. CLARKSON, F.R.I.B.A., of Poplar, and 28 Great Ormond Street, W.C., Miss PHILLIMORE'S architects. Mr.

HODGE was Messrs. SMITH'S foreman, and Mr. CONRADI has acted as clerk of works throughout.

Mrs. GLADSTONE, the wife of the Prime Minister, opened the building last Saturday, the 11th inst.

ROMAN PILLAR AT IGEL.

THE THEORY OF STORATION IN ART.*

Section 1.—Definitions.

STORATION is that section of the rules of applied art which governs (a) the selection and (b) the representation of meaning in the decoration of objects. The selection will be treated of in sections 4 to 8. The representation will be treated of in sections 9 to 14. The meaning must be definite and intelligible. Much decoration consists of mere geometrical lines or brushwork without any direct meaning, and this is of course excluded. The objects may be anything, from a sculptured building to a painted chair-cloth, which can be made more beautiful by the aid of art. Storation, as being mainly literary, lies outside the two great artistic virtues—truth and beauty. Truth of imitation is first—the imitation of the forms around, the gathering of artistic detail. Beauty is second—the selection and arrangement of the gathered detail of line, mass, and texture, in pleasing combination, proportion, modulation, variety, &c. Meaning is the third—the beautiful arrangement of truthful imitation having something added beyond what they can give, which appeals to the intellect and tells a story. The word is a new one, and the writer who is responsible for it recognises the onus of showing the necessity of an equivalent, the fitness, and the analogy with existing words. The necessity came when the early peoples began to record or tell stories on their tent-cloths or cave faces, *i.e.* to show to whom these belonged. As developed there are seven branches included in the word:—Inscriptions, &c., the most simple; heraldry, symbolism, landscape-painting, iconography, portrait-painting, and historic-painting, the highest. The same man or woman might do all these, but we are justified, by the division of labour in art, in regarding them as separate. The two often used words, "iconography" and "symbolism," cover only half the ground; historic paintings, such as Sir Frederick Leighton's at South Kensington, or those in the corridors of the Houses of Parliament, are neither iconographic nor symbolic (except in a very far-fetched sense); and neither are the names of potters and potteries, which are yet part of the decoration in the Ceramic Gallery at South Kensington. Heraldry, which is often the only clue to authorship and date in architecture, is (by reason of giving information), a branch of storation; but it lies outside of the two often used words. Hence the necessity for one single comprehensive term for the whole. The fitness will be perceived in the following. The analogy will be seen on reading in Harrison's "Description of England," 1580:—

... only the stories in the glass windows excepted;
in Milton's "Penseroso," 1637, line 159:—

And storied windows richly dight,
Casting a dim religious light;

and in Gray's "Elegy," 1749, line 41:—

Can storied urn or animated bust
Back to its mansion call the fleeting breath?

Section 2.—Divisions.

There are three mental stages in the process of storiating an object. The purpose, or function for which the object is intended will be ascertained, section 3. Those ideas associated directly or collaterally with the purpose which are capable of artistic expression will be considered, section 4. Those methods of representing the ideas which are technically possible will be selected, section 9.

Section 3.—Purpose.

The purpose of the object is not at the artist's choice. It is one of the data of his work, and it (generally) determines the treatment.

Section 4.—Associated Ideas.

In considering ideas, the storationist may either dig deeply or dig widely. He may search back, far into the past, and show the evolution of the particular subject, in its direct descent; or he may survey widely in contemporary manners and customs, and show the cognate subjects, in collateral descent.

Thus, in a theatre, the storationist might trace the evolution from the old Greek tragedies, which were religious and patriotic functions, with fate and controlling power involved in their action—through the comedies, no longer religious but for class amusement, in which the gods were ridiculed and relegated to

* A paper by Mr. Hugh Stannus, F.R.I.B.A., read at the Applied Art Section of the Society of Arts and printed in the *Journal*.

the background while human craft and passion constituted the weft of the fabric—through the miracle-plays of the middle ages, the moralities of the Renaissance, the plays of the Shakespearean cycle—down to the comedy of manners of the present day. Or, on the other hand, the contemporary varieties of the art, symphony, oratorio, opera, passion-play, history, tragedy, comedy, pantomime, as they are modified and mingled in various countries, might be exhibited. These two directions, in which the ideas are sought, will perhaps impress upon people the fact that they are not isolated, but links in two chains, one reaching back to the past beginnings of things, and the other by community of art joining all present existences, and so forming that net of sympathy which encloses all.

Section 5.—Groups of Ideas.

The ideas connected, directly or collaterally, with the purpose of an object are innumerable, and it is impracticable to set them down in order; but they may be divided into groups as follows:—(a) Those which are appropriate to the purpose (see section 6); (b) Those which are incongruous (section 7), and (c) Those which are indifferent (section 8).

An instance might be seen if, to choose a homely one, an embroidered seat-cushion were to be decorated with the imitation of (a) moss and violets; (b) a bird's-nest with eggs, and (c) bows and quivers, and garlands. And the same picture, e.g. of water with lilies, might be appropriate, incongruous, or indifferent, according as it was applied to (a) a splash-cloth; (b) a chair-cloth; or (c) a table-cloth.

Some further illustrations of ideas and of methods are given, but it should be observed that they are offered, not as examples to be followed in all cases, but as instances which are near at hand to a dweller in London. There is much storiation in the exhibition buildings at Chicago, judging from the interesting description by Sir Henry Wood in the *English Illustrated Magazine*, and there is some in the details of the "Griffin" monument, but the former is distant and the latter is somewhat unworthy.

Section 6.—Appropriate Ideas.

Churches have always been places for the decoration of which the people brought of their best, and the decoration always had meaning. In fact, the stories were painted or carved for the purpose of teaching long before it was realised that they contributed towards the beauty of the whole. And each place in the church had its special set of subjects which would affect the worshipper more appropriately or more strongly there than in any other.

The portal by the sculptures reminded him of the Presence into which he was about to enter, and of the heavenly host which surrounded him. The baptistery, through the twelve apostles as witnesses to the faith, reminded him of the necessity to keep it pure. The nave, with its Old Testament or pre-Christian history, showed the times of preparation. The chancel, with the life of Christ, showed the times of revealing. The apsis, with the figure of the bidding Saviour, invited him to come. The cupola, with its display of the resurrection and triumph of the Saviour, assured him of blessedness. The wall of exit, with its judgment-scenes, warned him of responsibility. These are some of the ideas which were portrayed, but they were often varied, and a complete collection of the various schemes of storiation properly indexed would be of great use.

The windows, or eyes of the church, have always been a favoured place for storiation. In these are opportunities for the heavenly hierarchy, the angelic chorus, the Bible persons, the teachings of the Lord, the local hagiology, &c., and as they are often given as memorials some personal allusions are admissible.

The pulpit might be treated in consonance with Paul's advice:—"Preach the word . . . reprove, rebuke, exhort . . ." (2 Tim. iv. 2), or, as in that at Pisa, erected at the time when the preacher had become important, with the so-called "liberal arts"—rhetoric, arithmetic, geometry, music, astronomy, philosophy, grammar and dialectics—grouped round the central support as handmaids to the chief sister, theology.

For the choir, when separated from the church, a fine idea may be taken from the successive invocations of the canticle, "O all ye works of the Lord, bless ye the Lord: praise him and magnify him for ever," with its grand crescendo from the natural phenomena through the animals and man up to the spirits of just men made perfect, "O all ye works of the Lord, praise him and magnify him for ever." The "Te Deum" has been used here, but it should be observed that "Laudamus Te" is only in the preamble. The hymn is really a prayer, "We therefore pray thee help thy servants," and as such it would be more appropriate in the nave, where the people sit.

The local-cult of the patron deity, patron saint, or collegiate body has always been a strong power in storiation. Two instances from the Acropolis at Athens and the Vatican Palace at Rome may be given.

At Athens to the old Greek the great statue of Athene was of the guardian deity of his city and nation. She was the "Pro-machos," the fighter in front, like the great twin-brethren

of the Romans sung by Lord Macaulay. The mariner saw her helmet as he rounded the promontory, and felt she was also the guardian of himself as much as of his nation. The chryselephantine work of Phidias within the shrine was dedicated to the same goddess as "Victory-bringer," and all around the peplum, the pediments, the Panathenaic frieze, or the metopes told the stories of her or of those other deities about whom Miss Harrison has unravelled the myths in so delightful a manner.

At Rome were the headquarters of that vast ecclesiastical organisation which sought to formulate and spread the faith of the Galilean fishermen until it should be universally accepted. The head of this—the father of the faithful—was wont to receive the ambassadors from other states in the Sala Regia, and this was appropriately decorated to show the victories or triumphs of this Church over those who had differed from or opposed it. Thus the humiliation of the Emperor Henry IV. by the Pope Gregory VII. in 1077, the humiliation of the Emperor Frederick Barbarossa by the Pope Alexander III. in 1177, the return of the Pope Gregory XI. from a semi-subjection at Avignon to independence at Rome, 1377, the defeat of the Moors at Tunis, in 1553, the defeat of the Turks at Lepanto in 1571, the overthrow of the Huguenots at the massacre of St. Bartholomew's in 1572, each represented in a large picture, had a lesson to convey to those envoys from the foreigners, the moral of which was not far to seek. Two of the Stanze, which are approached from the Loggia of Raphael, on the same floor, have similar significant storiation: the Sala di Constantino shows the victory and the baptism of the first Christian emperor, and his address to his army, and also his donation (of the city of Rome) to one of the popes; the Sala d'Eliodoro shows the expulsion of Heliogabrus from the temple, the repulse of Attila from Rome by the Pope Leo I., the liberation of St. Peter and the conversion of the sceptical German priest; all of which would be food for thought on the part of opponents in demonstrating the venerability, the far-reaching power, and the benevolent intentions of the keepers of the faith.

Historic monuments must, of necessity, be storiated. The Trajan Column, at Rome, records the campaign in Dacia. The Vendôme Column, at Paris, records the campaigns in 1805. The arch at the top of the Champs Elysées, at Paris, records other Napoleonic campaigns up to and including the battle of Ligny in 1815. The ideas in these appear to have been generally a glorification of the destructive arts, with representations of incidents in the campaigns and of the spoils taken from their enemies.

Personal monuments are also often storiated. The ideas associated with monuments have been well classified by M. C. Daly under the three heads of:—Death, or those connected with the sense of the loss of a friend, of the silence of the tomb, and of the decay of the body; 'Glorification, or those connected with the personal appearance, with the virtues, the abilities or tastes; and Faith, or those connected with the teachings of religion and the belief in immortality.

The first of these deals with the old pagan "properties" of the inverted torch, the winding-sheet, and skull and crossed-bones.

The second informs us what particular virtues the deceased avowed, or wished to be thought to practise, as in the monument erected by Can Signorio della Scala for himself at Verona, after he had murdered his brother, which bristles with twelve statues of selected saints and virtues. A more worthy instance is the monument to the late Prince Consort in Hyde Park, which shows a portrait-statue, and alludes to his generous and discriminating encouragement of the arts and sciences and the international character of his sympathies. Personal tastes are shown in the fine frieze round University Hall, Gordon Square, to the memory of Henry Crabb Robinson, which collects, as in a conversazione, some of the men and women he knew. Another instance is seen in the memorial to Professor Fawcett, intended by Sir Henry Doulton for Vauxhall Park. There is a portrait-statue, with a figure of Victory behind; and in the panels of the pedestals are subjects appropriate to his character—Courage, Sympathy, Justice and Truth; and to his work—Good News, Bad News, a Woman Postal-clerk and India.

The third group of ideas is more consonant with our feelings in England, and instances will occur to everyone who gives attention to the subject. We English are reticent in feeling, and object to spend on sentiment that which may be better used for benevolence, and our climate is not favourable to hypæthral sculpture; but a walk through a cemetery is instructive.

Social life and civilisation often give ideas. Some of these are effectively worked in at some of the mairies or official centres of the districts of Paris. It is there that marriages are solemnised, that births are registered and that the conscription-lists are prepared of those on whom their country has claims for duty. The decoration in that of the thirteenth district by M. Boulanger is in a Classic style, and shows, on the four

walls, the four ideas of marriage, manhood, family-life, patriotism.

The Hôtel de Ville, which was destroyed during the second siege of Paris, contained, in the twenty-eight cove-panels of the great hall, a history of civilisation. As these were so complete in arrangement, a list of the subjects is here given with translations of the Latin mottoes:—1. Mother Nature—"The race of men arises." 2. Contest with Animals—"He fights against the wild beasts." 3. Shepherd life—"He holds the flocks in his hand." 4. Early metal-working—"He is pressed by various labours." 5. Spinning and building—"And they prepare clothes and houses." 6. Slaying a ram—"The gods are appeased with a sacrifice." 7. Cornfield—"The harvest enriching the husbandman." 8. Use of the vine—"He dissipates his troubles." 9. Music—"Songs harmonise with the lyre." 10. Astronomy—"He marks out the months and the stars." 11. Navigation—"He sends out ships on the sea." 12. Steam—"Force more intense from confinement." 13. Drama—"The two-faced mask weeps and laughs." 14. Metaphysics—"Man in intellect approaches deity." 15. Theology—"Instruction confirms faith." 16. Physics—"He seeks the causes of things." 17. Justice—"The goddess avenger of crimes." 18. Government—"Authority administering affairs well." 19. Geometry—"He measures everything in the world." 20. War—"Thus cruel wars assail." 21. History—"Clio singing of heroic deeds." 22. Medicine—"Diseases are cured by the physician's art." 23. Benevolence—"Charity is the nearest to God." 24. Oratory—"He rouses, he delights, he teaches." 25. Fine arts—"The three arts flourish as one." 26. Choral dance—"A dance to the sounds of a flute." 27. Agriculture—"Abundance scatters her fruit." 28. Fame—"She shows the way to the stars."

Textile objects—*e.g.* curtains, &c.—seem to invite allusions to Arachne the ambitious webweaver, Penelope the faithful wife, Dorcas the benevolent widow, or that unfortunate Lady of Shalot, among others.

Fireplaces invite the Plutonic cycle—Hephaistos and the Kuklopoi, King Alfred and the cakes, the "Golden Milestone" of Longfellow, and many other pleasant ideas to the home-loving Englishman.

Drinking-fountains need not always show us heathen nymphs, aquatic plants and dolphins, but may represent Abraham's messengers, David with the dearly procured water, the Samaritan well, Sir Philip Sidney, or the big sister of to-day lifting her little sister to have a drink, &c.

In thus interweaving the ideas with the decoration there will be a leading out of the mind by the associations, an interweaving of the interesting with the commonplace, a connecting of the lesser with the greater, a looking from the lower to the higher, which it is the privilege of poetry to add to life, and which storiatio adds to life's surroundings.

Section 7.—Incongruous Ideas.

The writer leaves this invidious portion of his subject unwritten.

Section 8.—Indifferent Ideas.

Some purposes of objects are so indefinite or uninteresting, and their associated ideas are so commonplace that these are passed over, and the storiatioist arranges some scheme which, though not suggesting the purpose, is yet not incongruous. An instance exists in the refreshment-room at the South Kensington Museum, where the beautiful panels by Mr. E. J. Poynter, R.A., show the twelve months and the four seasons, instead of such subjects as would, though appropriate to a grill-room, be commonplace and unelevating. On buildings and other objects which are indefinite, the following may be used:—Bible history always, local history and tradition often, and seasons and times generally.

Bible history is universal in every time and country, from those grand Byzantine gates and frontals onwards.

Local history instances are so plentiful that the "History of Manchester," by Mr. Madox Brown, in the Town Hall of that city; the "Chevy Chase," by Mr. W. B. Scott, at Wallington, in Northumberland; and the "Dragon of Wantley," by Mr. E. J. Poynter, at Wortley, need only be referred to.

Seasons and times are shown at South Kensington (as before mentioned).

The life of man is pathetically shown round the drums of the terra-cotta columns, by Godfrey Sykes, in front of the lecture-theatre at South Kensington. These have been so fully described by Mr. Pollen that no more need be said than to refer to his pamphlet on the subject.

Bestiaries are found in many places, Westminster chapter-house and the great hall at Padova being instances.

The literature of a country will furnish a perennial supply for this group, and all workers in decorative art feel a debt of gratitude to their brother artists in this for their inspiration.

Section 9.—Methods of Representation.

The methods by means of which the associated ideas are represented may be divided into groups as follows:—I. Imagination (including in that division all poetic and abstract

renderings). II. Reality (the representation of facts that have been or are). III. Epigraphy (not representation by picture but by word).

These groups are further subdivided, according as the methods are treated, as follows:—A. Mythically, including under this sub-group such as are (1) Supernatural; (2) not in ordinary experience; (3) not situated on our own globe; (4) involved in prehistoric obscurity; (5) the creation of poets and other "makers" of literature; and (6) the personifications of abstract ideas. B. Historically, *i.e.* in a "matter-of-fact" manner, with no meaning beyond that which is shown on the surface. C. Typically, *i.e.* such as are selected because they show the desired characteristic in a greater degree than others. D. Symbolically, *i.e.* such as have another or inner meaning, beside or beyond that which is apparent at first sight.

The complete list of methods is shown in the table, section 10. It should be here observed that it has not been always possible to classify logically, and some methods are grouped by affinity rather than by evolution.

Section 10.—Table of the Twenty-two Methods of Storiatio, by Means of which Ideas are Represented in the Decoration of Objects.

Storiatio.	I. Imagination	A. Mythic	a. Episode
			b. Personage
		D. Symbolic	c. Locality
			d. Attribute
	II. Reality	B. Historic	e. Device, &c.
			f. Heraldry
			g. Colour
			h. Event
		C. Typic	i. Person
			j. Place
		D. Symbolic	k. Occupation
			l. Worker
	III. Epigraphy	B. Historic	m. Scene
			n. Action, &c.
			o. Instrument
			p. Result
		D. Symbolic	q. Name (only) of event, person or place
			r. Word (only) for idea
			s. Date (only) of event
			t. Allegory, &c.
		D. Symbolic	u. Motto, &c.
			v. Letter, &c.

Section 11.—Details of Methods.

(a) The episode from myth or poetry is used when no suitable historic events can be found which will represent the desired idea. Instances of the mythic episode are seen in the "Orpheus singing" of the meeting-room frieze at our Society's house, &c.

(b) The personage, *i.e.* ideal portrait, includes such as are classified in the six divisions of group A in section 9, *e.g.* gods and goddesses, and the personification of the virtues, elements, planets, arts, sciences, &c. Instances are seen in the "Thames" of the meeting-room frieze, the "Fortitude," "Faith," "Charity" and "Justice" of the Gordon monument, the "Britannia" of the bronze coinage, the figures on Sir F. Leighton's Jubilee medal, &c.

(c) The locality, *i.e.* ideal view, includes such as are mentioned in section 9. Instances are seen in the "Elysium" (and "Hades") of the meeting-room frieze, &c.

(d) The attribute is the representation of an object which has been given up to a certain use, so that on seeing it the association of its user or usage arises in the memory. The garland of fruit, which was hung about the altar and the victim, as also the patera, vase and other sacerdotal appliances, when represented on the Roman temples, thus suggested their religious ritual. So also other objects, in consequence of their association with their particular gods and goddesses, came in time to suggest them; thus the eagle and thunderbolt of Jupiter, the lyre and laurel of Apollo, the aegis and owl of Minerva, &c. Afterwards to suggest the character or quality; thus the eagle for majesty, the laurel for peace, the owl for wisdom. When iconographic hagiology was crystallised in the Middle Ages, the representations of martyrs included the instruments which were associated with their martyrdom, *e.g.* the flaying-knife of Bartholomew, the wheel of Catherine, &c.; or with some other event, *e.g.* the keys of Peter, the serpent-chalice of John, the giant form of Christopher, &c.; or some companion, *e.g.* the stag of Hubert, the Assyrian monsters afterwards adapted from Ezekiel for the Evangelists, the pig of the Paduan saint, &c. The authorities on this subject are Durandus, Ripa, Didron, Mrs. Jameson, &c. Instances are seen in the scales and sword of Justice, the anchor of Hope, in many churches, &c.

(e) The device is the representation of a scene or object. Those on the shields of the "Seven Chiefs against Thebes" are minutely described by Aischulos (d. 456 B.C.); three of them were accompanied by mottoes, but these latter were not an integral part of the device.

The emblem was a short verse or motto, with an explanatory picture.

The impresa, as adopted by the Renaissance Italians, on undertaking any adventure, was a small picture, with an explanatory motto.

These two latter were so similar in their result—the picture and the motto—that the words came to be used synonymously.

The authorities on this subject are Alciati, Giovio, Ruscelli and Bargagli; followed by Cats, Quarles, Whitney, &c., down to our own venerable member, Mr. John Leighton. Instances are seen in the "Cave Canem" picture from Pompeii, many printers' marks, many examples of the recently-revived "Ex Libris" taste, &c.

(f) The heraldic shield is well known, and need not be particularised. Instances are seen in the royal shields on Westminster Bridge; those of the four kingdoms, together in quarters or separate, on the Houses of Parliament, &c.

The heraldic badge is (1) a charge taken from the shield; (2) the crest taken from the wreath, and used independently, e.g. the portcullis, feathers, &c.; or (3) objects taken not from bearings, but from any other convenient source, e.g. the sprigs of broom, rose, shamrock, &c., in the caps, or the knotted cord on the coats of retainers. Instances are seen in much of the carved enrichments of the Houses of Parliament.

(g) The symbolic colour was more used in the Middle Ages, though the revival of stained-glass during the last twenty-five years has drawn attention to it. Instances are given in chap. iii. of Professor F. Edward Hulme's interesting work on the "Principles of Ornament."

(h) The event is the representation of an actual occurrence in local or national history. Instances are seen in the "Victors at Olympia" of the meeting-room frieze; the Capture of Acre and the Forgiveness of the Chaluz archer in the Richard I. pedestal-panels in Palace Yard; the pictures from the Civil War in the Houses of Parliament, &c.

(i) The person, i.e. a known individual, shown by a portrait, is used singly or collectively. Instances are seen in the statues of artists in front of the Royal Academy, the mosaics round the Loan Court at South Kensington, &c., for the former treatment; and in the Crabb Robinson frieze at the University Hall, the podium of the Albert Monument, &c., for the latter.

(j) The place, i.e. the view of a particular town or country, is represented by inhabitants, as in the "Harmony welcoming the Nations" by Lameire; views, identifying it by well-marked natural surroundings, e.g. Naples by Vesuvius; or by well-known buildings, e.g. ancient Rome by the Coliseum, or modern Rome by St. Peter's; or by maps, e.g. in the Vatican gallery. Instances of this in London are not known to the writer.

(k) The occupation is represented by figures engaged in such as suggest the required idea. Instances are seen in the Industrial Arts of Peace and of War at South Kensington, the Arts and Sciences in the Albert Hall frieze, &c.

(l) The worker is not individualised as a portrait, but represented by the typical craftsman, clad in his working clothes, with his characteristic tools and specimens of his craft. Instances are seen in the figures typifying the chief livery companies of the City of London, in the Guildhall council chamber, &c.

(m) The scene, i.e. not any particular place, but a generalisation of climatic character, is represented by inhabitants, as in the actual place; the flora, e.g. the torrid, temperate and Arctic zones, by the palm and cactus, the oak and grass, the fir and moss; the fauna, e.g. the above by the lion and crocodile, the horse and otter, the white bear and seal. Instances of this in London are not known to the writer.

(n) The symbolic action is a dramatic rather than a graphic method of expression, and it is included here only to complete the classification. It is more used in the early stages of language than when they have become perfect and flexible means of communication. Instances are given in chap. ii. of Professor Hulme's book before mentioned.

(o) The instrument is such as is commonly used in any occupation, represented singly or in groups or trophies, e.g. the palette and brushes of painting, the telescope, retort, pulleys, &c., of other occupations, &c. Instances are seen in the trophies of tools hung on each side of the exhibition certificate, which is used as a frontispiece to the book, "Alfred Stevens and his Work," lately published.

(p) The result is the effect of the worker using his instruments to produce objects of art, &c., gather food, prepare shelter, capture arms, &c. Instances are seen in the paintings of silversmithery in the Loan Court at South Kensington, the reliefs of Indian and French arms on the Wellington Monument, &c.

(q) The name is used singly or in series, to represent event, person or place, when the position or means require such extreme simplicity. Instances are seen in the victory tablets round the Wellington Monument, the potters round the columns in the Ceramic Gallery at South Kensington, the potteries in frieze of same gallery, &c.

(r) The word for an idea, singly or in series, is used under

similar circumstances. Instances are seen in the words "Agriculture," "Commerce," &c., recording the branches of our Society's work in the meeting-room cove, &c.

(s) The date is useful, among other purposes, in recording the erection or completion of buildings, &c. Instances are seen in many public buildings in London, though not so universal as they should be.

(t) The allegory (including in this the parable and fable) is a literary rather than a graphic method of expression, and is included here only to complete the classification. Its function in literature is analogous to that of the symbol in art, i.e. to speak otherwise than by the mere primary meaning of the word or objects. Thus the "Pilgrim's Progress" is an allegory, and the "Catherine wheel" is a symbol.

(u) The motto (including in this the proverb, &c.) is used under similar circumstances as the other methods in this Group III. It is the most direct method of telling a story, but its interest is mainly literary, the artistic value depending on the decorative appearance (or otherwise) of the alphabetic characters, e.g. the Cufic letters in the Alhambra inscriptions. Instances are seen in the quotation from Spenser in the Octagon Room of the R.A., many sword-blades, the "Waste not, want not" of the bread platter, &c.

(v) The letter is the most simple, but it is not without its symbolic value. The monogram, in its earlier style of conjoined letters and its later style of interlaced ones (ciphers), has been very useful to the antiquary. The sign, conventionally degraded from picture-writing, used for the planets, zodiacal constellations, metals, alchemic decoctions, &c., has interest and value. The rebus, or substitution of representations of things for the proper name is of great help to the antiquary, and may be classified in this group. Instances are seen in the alpha and omega, the chi-rho, the ciphers on railway carriages, the chemist's show bottles, many old monasteries, &c.

Section 12.—Combination of Methods.

These methods have been sometimes combined; the attribute included in the representation of the personage, the person in the event, or the result (e.g. the trophy of game) with the instrument (the fowling-piece).

The mythic has been combined with the historic in some of our monuments, where the neptunes and sea-divinities support the English captains, the figures of fame crown the dying generals, or the skeletons are throwing darts or grasping at the fainting ladies.

Mythic personages have been also substituted in representing historic events. The crossing of the river Rhine, near Nimeguen, by the French king, Louis XIV., in his attempt to conquer a portion of Holland, took place in 1672. At the palace of Versailles, near Paris, this event is represented as follows. A man, presumably a portrait of the king, drives a chariot towards the left side of the picture, and threatens some figures there with a "thunderbolt"; the chariot is pushed from behind by Hercules, who is also striking with his club at an old man who sits on the ground with an overflowing urn, representing the river; Phœbus lights the chariot and Minerva guides the driver; while several winged females (in the air) are carrying chaplets and palm-leaves, and blowing trumpets. The whole is an instance of the treatment of reality as if it were imagination.

The series of the history of Maria de' Medici in the Louvre also shows the mixture of mythic personages with historic persons.

Section 13.—Overlapping in Representation.

Sometimes in an object the same person may occur twice. Thus in the Albert Monument, Michel Angelo is represented on the west side among the sculptors, and on the east side among the painters. Similarly, in the storiation of a church, if the Evangelists are separated from the Apostles, as is generally done, John and Matthew will be represented twice. So also with any person who is known in two characters.

Section 14.—Duplex Storiatio.

Double representation of the same idea is often found in Mediæval storiatio. Two books, published very early in the Middle Ages—the "Speculum Humanæ Salvationis" and the "Biblia Pauperum"—both give events from the New Testament history, each accompanied by other events in earlier history, with inscriptions, in what is known as the type and anti-type manner. They are very systematically worked out, showing the evidence of much time having been spent upon them; and these, which were doubtless handbooks to the artists of the time, accustomed people to pictures of the N.T. history with the earlier events represented in the backgrounds, and thereby made the storiatio more interesting.

An analogous treatment was followed in the Passion play at Ober Ammergau, during the Last Supper, when parallel scenes—of the Israelites gathering manna, and of Melchizedek offering bread and wine—were shown as *tableaux vivants* in the background, while explanatory words were chanted by the chorus.

Mr. Walter Crane, who has done so much for decoration and for artistic books in England, has adopted the above expedient very charmingly in his books—"Bluebeard," where behind the tempted wife with the key is shown, on a curtain, Eve with the Apple—"Puss in Boots," where at the marriage-feast is shown on the tapestry the other Cat that killed the Rat—"Frog Prince," where is shown on the table-cloth that other frog who would a wooing go—and in "Beauty and the Beast," where is shown, on the harpsichord, the Beasts charmed by Orpheus.

Section 15.—Available Spaces.

The number, size and proportion of the available spaces will always govern storiation, and of this the artist will be the best judge. In connection with this, an amusing instance of a space being too large is on record. It was stated that at Washington the painting of the grand historic frieze was brought to a standstill, as there was "not enough history to go round;" so, it was said at the time, they would have to wait until they had made some more history.

Section 16.—International Selection.

In the choice of persons or circumstances to illustrate any idea it is well to remember that human achievement belongs to no one country, and to select the most representative men and women regardless of nationality, thus making the idea truly international. The storiator that, while including some very second-rate French authors, could ignore Shakespeare and Milton, may be prompted by patriotic motives, but can only have a cramping effect on the intelligence of the inhabitants. It is pleasing to observe in the statues on Pennethorne's university building, that of twenty-two great men twelve are of other nations, from Plato and Galen to Cuvier and Linnæus; and so, also, in the great artists in the podium of the Albert Monument.

Section 17.—Didactic Use.

It is further useful in teaching. Paulinus, a bishop of Nola in the fifth century, as quoted in Didron (Bohn's edition), i. 4, and Geoffrey, a bishop of Auxerre in the eleventh century, as quoted *ibid.* i. 5, both give reasons which are interesting. Dante in the Purgatorio gives two instances of this didactic value. In Canto x. 28 to 51, a marble relief, showing humility towards superiors, by Mary; in line 52 we read further, "Un'altra storia nella roccia imposta," which shows humility towards equals, by David; and in line 70 we read he moves his feet to examine another "story," which shows humility towards inferiors, by Trajan. When we know that these sculptures are in that circle of the Purgatorio in which the sin of pride is punished, their appropriateness is apparent. In Canto xii. 25 to 72 we read of another marble showing instances of humbled pride, from Satan to the destruction of Troy; and he gives as the purpose of these stories, "Si che veggiate 'l vostro mal sentiero."

In the Palazzo Pubblico at Siena is a very interesting fresco showing the results of good and bad government, as in an antithetic parable. And as a last instance: that which is the most beautiful of all, may be seen the noble ruin of Lionardo's in that refectory where as often as the brothers met together, they were reminded to "do this in remembrance of Me."

Section 18.—Emotional Value.

It is found that pictures excite the multitude more than writings, partly by association and partly by being more quickly intelligible. The celebrated Italian, Napoleone Buonaparte, who was for some time Emperor of the French, gave an interesting instance of this when he was contemplating the invasion and conquest of England in 1805. He caused the Bayeux tapestry to be removed and exhibited at Paris, with a view to stimulate the passions of his subjects to attempt once more that conquest which the tapestry showed had been so easily accomplished before by William of Normandy. It is also related that Rienzi, the unfortunate political reformer of the fourteenth century, commenced his appeal to the people of Rome by exhibiting, in various public places, pictures of the degradation of the city, on which he made speeches.

Section 19.—Historical Value.

This is one of the most important branches of the subject, requiring much space to show even the mere outlines of the ground to be covered. The ideas which were chosen at various periods would form an interesting chapter of storiation, but it can be only mentioned in this paper. And now that archaeology is becoming, as an exact science, a worthy and necessary sister to history, this chapter is being written, and is yielding the most interesting and valuable results.

Section 20.—Necessary Knowledge.

In the preparation of a complete scheme the necessary knowledge will be seen to be great and wide. The storiator must know somewhat of many things, and also of the places where further knowledge is to be obtained. Hence the scheme has often been prepared, not by the artist who executed the work, but by the learned man (priest or scholar) who alone had

the grasp of the threads constituting the warp of their knowledge.

But the technical processes of artistic expression must always be considered, and some subjects, *e.g.* the Isolation of Oxygen, by Priestley; the Observation of the Transit of Venus, by Horrocks; the Identification of Lightning, by Franklin—which are easy in painting or relief, present great difficulty in statuary; so also other subjects, *e.g.* a fight for a standard or a football scrimmage, are more clearly understood in isolated statuary groups than in flat presentation. Therefore the artist who is to execute the work must be allowed (in consultation) to choose the exact treatment which inspires his mind. The choice of ideas is mainly literary, and that of methods mainly artistic. The storiator may select the ideas in consultation with the artist, and the artist should determine the method of representation in conjunction with the storiator.

In deciphering storiation much knowledge of the mythologies and histories of all peoples is also required. That of the Greeks and Romans has long been a part of school-curriculum; that of the Egyptians and Assyrians is a part of the equipment of archaeologists. That of the Hindoo nations has been condensed into an admirable handbook by Sir George Birdwood, which explains much of the Hindoo art that before was involved. Mr. James L. Bowes, in the notes at the end of his beautiful book—"Japanese Pottery" (Liverpool, 1890)—has done the same good service to the student of Japanese decoration. When the beginner learns how every plant and every attitude of the plant, as also every animal, has a symbolic meaning; that when one gentleman presents a picture of the pine-tree, bamboo, and plum-tree to another, he is wishing him good fortune and promising eternal friendship, he will judge the work for its value symbolically as well as æsthetically, and much that is puzzling in their distribution or arrangement now will be then made clear.

Section 21.—Reading the Storiation.

The purpose of a building may often be shown by its exterior decorative sculpture or mosaic. The classes of buildings may be determined generally by the architectural treatment of the roof and of the doors and windows. Thus museums, hospitals and factories all show their class; but the particular kind of object, disease and manufacture, is not shown by the exterior architecture, and can only be ascertained when sculpture assists by storiation.

It does for architecture that which words do for music. Music and architecture suggest, but words and storiation can also describe and inform. Hence the value of storiation when appropriate ideas are shown. An example is seen in the large building on the west side of Whitehall, which contains the Home and Foreign Offices. Each division of the building has seven spanrail panels, with low reliefs of mythic personages below, and six circular niches with busts of historic persons above.

In the Home Office the order is:—Spanrails—Law, Agriculture, Art, Science, Manufacture, Commerce, Literature. Niches—Gascoigne, Sinclair, Reynolds, Bacon, Watt, Smith. In the Foreign Office the order is:—Spanrails—Government, Europe, Asia, Africa, America, Australasia, Education. Niches—Elizabeth, Drake, Livingstone, Wilberforce, Franklin, Cook.

This is not the occasion to speak of the splendid sculptural qualities of the sitting figures in the spanrail panels, but the thoughtful manner in which the details are worked-out is well worthy the attention of the passer-by; and the introduction of the ideas of government and education seems to suggest that Great Britain realises its duties towards the foreign possessions. But the chief point is that the thoughtful spectator recognises the purpose of each division of the building.

It is pleasing in this connection to see the spectators round the Albert Monument purchasing the penny book which gives details of the persons represented; thus storiation is incentive to study, and gives interest in proportion to the knowledge of the beholder.

Section 22.—The Central Idea.

All pictures in monumental decoration should be arranged in connected series or sets. The impressiveness of a number increases, like the examples in natural philosophy, in square ratio. If we view one picture—say of John Howard visiting a lazaret-house—we may observe a man accompanied by a number of officials in a horrible place with a great quantity of human suffering; but if we contemplate a series of pictures—another of Elizabeth Fry seeking to reclaim the poor women in Newgate, and another of Florence Nightingale nursing the sick and wounded at Scutari, then we observe amid the varying circumstances of the Russian lazaretto of 1789, the English gaol of 1820, or the Turkish hospital of 1855, that there is one circumstance in which they all coincide—the benevolent and beneficent care of those who cannot care for themselves; and this central idea, which we trace in all, is the idea of the storiation. So also if observing representations or names of Moses, Joshua, David, then we would guess Hebrew worthies

for a school. If of David, Charles Martel, Alfred, then patriot kings, for a palace. If of Moses, Lykurgos, Justinian, Napoleon, then legislators for a Senate-house. If of Napoleon, Hannibal, Charlemagne, then generals who have crossed the Alps for a military school. If of Pliny, Cuvier, Linnæus, Owen, then naturalists for a natural history museum.

This connecting of different events or persons by the central idea, as if separate pearls on the same silk, or separate stones in the same setting, is an expedient which has often been used in our sister art of literature, and it is one of the great charms of storiation.

Section 23.—Some Sources.

In literature the sources for ideas are many and copious. The Bible is full of such, which are familiar and dear to all, and from its riches may be picked out such as are appropriate to all sorts and conditions of men. For the palace David and Hezekiah, for the judgment-hall Samuel and Gideon, for civic life there are no events or persons, but the Proverbs have been a rich store for epigraphy, and for the peasant Jacob and Ruth among others.

Other collections which appear almost to belong to humanity are Homer, Dante and the beautiful Sanscrit legends which have been presented to Western ears by Sir Edwin Arnold. Our own literature lies still nearer, and Chaucer, Spenser, Shakespeare, Swift and Burns are ever fresh. In our own time the poets have shown sympathy with our arts, and hence the works of such men as Browning, Rossetti, Tennyson, Longfellow and Morris are full of suggestions which have been used with avidity.

Contemporaneous events will also furnish circumstances and incidents which might be utilised to give a point of interest to our work. Work which sets down facts will increase in interest as time goes on, while that which merely gives us the old imaginations of fames, victories and cupids will soon cease to have any. And further it may be averred that there are saints and heroes around, probably as worthy as some that have been officially stamped, who (typically represented) would make our work more worthy of our age.

Section 24.—Cautions.

Errors may arise in place, kind and quantity. The place, when storiation is applied externally, may be on all buildings and on most other objects; but, when applied internally, it is more appreciated in public than in home life. On functional features it should be avoided. Thus the niches of a building (which are decorative) might contain statues of statesmen, &c., but for the telamones or supporting figures of a portico (which are functional) there should be no portraiture. A portico supported by two William Pitts, or by Pitt at one side and Fox at the other, would be absurd. On borders, as a general rule, it should be avoided, and should be reserved for panels and friezes.

The kind should not be too grave for its place. People do not like high tension in their homes; and when any storiation is introduced, it should be of a pleasing rather than harrowing character.

The quantity should not overpower the æsthetic nature of the decoration. It should be used rather as a "flavouring" than as the staple portion of the work, unless absolutely necessary by the function of the object.

Section 25.—Opportunities.

Storiation might be used much more than at present in England. It is not the whole nor the chief gospel of decorative art. It will not bring the millennium, but it will add meaning to beauty, as beauty was added to truth; and there are mosaic-workers and relief-sculptors in numbers who could execute all that is required to make our streets beautiful with colour and delightful with stories that should again be as books to poor men.

And indoors, in the house and the school, there are spaces which it is the aim of some well-known societies to fill, and among the latest of these are the efforts by Messrs. Selwyn Image, Heywood Sumner and others.

The writer thus pleads for more storiation—for more of these "histories and sermons which we can read without the trouble of turning over the leaves"—so that the surroundings and, with them, the lives of our land may be made more beautiful.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute of Architects was held on Monday evening, Mr. Macvicar Anderson, president, in the chair.

Royal Gold Medal.

The PRESIDENT announced that the Council had nominated Mr. Richard Morris Hunt, of New York, as a fitting person for Her Majesty to bestow the Royal Gold Medal on for his works as an architect. This had been announced by letter to

Mr. Hunt, who replied, expressing his gratification at the proposed honour.

Mr. WOODWARD said that the announcement made to Mr. Hunt would place members in an invidious position if they wished to nominate some other architect as recipient of the medal.

The PRESIDENT said it had evidently been the intention to find out whether Mr. Hunt would accept of the honour.

Colonel LENOX PRENDERGAST then read a paper, of which the following is an abstract:—

Cathedral of Palma.

Colonel Prendergast, in his introductory remarks, drew attention to the situation of the cathedral. It had been the ancient stronghold of the Moors, and on it, the site of their greatest mosque, stands the Christian church. The church was designed by Don Jayme of Aragon in 1232, after the rescue of Majorca from the Moors, which took place in 1229. The progress of the Moors in refinement and the arts had been hardly less brilliant and rapid than their progress in empire, and the architectural works undertaken by Don Jayme owed much of their delicacy and refinement to them. The enthusiasm of the Majorcans at their deliverance by the king of Aragon found expression by their founding the cathedral church of Palma.

The late Mr. Street, in his "Gothic Architecture in Spain," when speaking of St. Maria del Mar at Barcelona, claimed Palma Cathedral for its prototype. In the Governor's palace there were traces of Moorish work, especially in the foundations, but of Moorish architecture, as such, he could find none. The west front of the cathedral faced the entrance to the palace; the upper portion had only recently been completed, and though its design might have been worse, at a distance it did not jar with the rest of the building. The south front was, however, a marvellous creation in Santanny stone, and the effect singular in the extreme. The west door was considered a work of importance. The interior of the church, owing to the formation of the ground and the difference of space separating the arches between the north and south entrances and the remaining arches, appeared considerably larger than it really was. A bishop's throne occupied the centre of the east wall, and above rose the chapel of the Holy Trinity, standing many feet above the floor of the rest of the church. The finest work, architecturally, was that carried out by Bishop Pedro Cima about 1373; to that period also might be assigned the three easternmost bays of the nave; and at that time the effect of the interior of the cathedral must have been singularly fine as a specimen of Gothic architecture and fittings. Having given certain measurements of the columns, length and width of the church, the height of the central nave and side nave, Colonel Prendergast turned to the question of lighting. To a Spaniard the practice of admitting the sun anywhere was not to be entertained for an instant, but the solution of the strange blocking up of window tracery with stone was, to the author's mind, due to the enormous height of the church, which rendered it necessary to strengthen the supports; although, notwithstanding these precautions, several bays had had to be rebuilt. There was one other solution, viz. where the sun entered in force battalions of flies followed in its wake; but whatever the reason, the side-chapels were practically unlighted, and appeared to have been so from the first. Each chapel, of course, contained an altar, and behind the altarscreens were tombs of bishops with carving well worthy of study.

Turning to the ground-plan of the cathedral, the author described the uses to which the building was put, remarking that a knowledge of the purposes for which ancient buildings were erected was necessary if they were to be restored or appreciated. The plan was simple; three full-sized naves or aisles were placed side by side, the centre one having at its eastern extremity the sanctuary which contained the high altar. The choir was situated in the nave, two bays westward of the sanctuary arch, which was the usual Spanish arrangement, to explain which he described in detail the ceremonies of the Good Friday and Easter Day services in relation to the planning of the building, and pointing out the utility of the various parts of the church, said there could be little doubt that the architects thoroughly understood their business and for what they had to provide. The high altar, consecrated in 1346 by the seventh Bishop of Majorca, was of marble, and above it was a singularly fine "retablo" in sculpture, while several niches on each side contained figures of saints, all admirably carved in wood. In the treasury were several reliquaries of the best period of the architecture of the church. Of these the author mentioned a few, giving the approximate date of each. Those who had charge of the church never seemed to have relaxed their efforts to obtain what was most fitting, the best artists being apparently always engaged. Referring to the stability of the structure, which had at different periods to undergo a process of reconstruction in several directions, he quoted from a document concerning a commission of architects appointed to examine the mischief going on subsequent to the

completion of the building, and gave reliable Spanish authorities for the dates at which every portion of the work was executed. Going beyond the precincts of the cathedral, towards the head of the harbour, the author described a remarkable building erected as an "exchange" for the merchants of Palma, on land placed at their disposal in 1232; the building was not completed, however, until the middle of the fifteenth century. It consisted of a rectangular hall divided into three divisions by a double row of spiral columns, three on each side, which supported an arched and vaulted roof. Traceried windows and carved doorways of the fourteenth century combined to exhibit what appeared to him an altogether new experience of Gothic Pointed architecture as applied to civil buildings. A month had passed since his arrival before he visited the Lonja, or exchange, and during that period mischief of a serious kind had been done. The authorities had decided to renovate the interior. The walls were certainly darkened and stained by age, but there was a tone of colour on the flutes of the spiral columns and ribs of the vaulting which enhanced the effect to such an extent that to scrape off the patina seemed little short of sacrilege. Colonel Prendergast then described the injury which was being done, and quoted a letter written by himself, in which he referred to his membership of the Institute, to Mr. F. W. Mark, the British consul, and stated that, in consequence of their united efforts, and a local newspaper publishing his letter with a communication in similar terms from the consul, a strong feeling arose in the city against the work being continued. That reached the ears of the Government at Madrid, who stopped supplies, and before he left he had been gratified to know the scraping had ceased. With reference to the Casa Consistorial, another civil building at Palma, which the letter urged was worthy to be preserved with jealous care, it was, he was told, not to be pulled down, as had been contemplated, to make room for a feeble imitation of the Lonja, but that the roof was to be repaired and the building preserved.

Mr. WM. WHITE, F.S.A., proposed a vote of thanks to the Colonel for his paper.

Mr. O. HANSARD seconded.

Mr. BREWER and Mr. WEALE having made some remarks, the President put the vote to the meeting, and it was carried by acclamation.

Colonel PRENDERGAST briefly replied, and in doing so alluded to drawings shown and done by Mr. Rimmer and Mr. Prentice.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the ordinary meeting of this association in the Royal Institution, Mr. W. W. Robertson, president, in the chair, Mr. A. N. Paterson, M.A., A.R.I.B.A., of Glasgow, read a paper entitled "Colour as a Means of Architectural Expression." By way of introduction it was shown that the materials which the architect employs having each their colour value, his art is essentially chromatic, and that in consequence the study of colour is of first importance; that, nevertheless, it has been much neglected by architects, and that to this among other causes is due much of the monotony of present-day architecture. Architectural expression is regarded to be as much a matter of colour as of form, the term expression being used to indicate the individuality which differentiates one building from another, as well as the quality and character of the design in any one building. Three main lines of colour-study are laid down as being of most advantage to the architect. I. An examination of some of the principal laws of the science of chromatics, with the facts thereby to be discovered regarding the effect of colours according to their position and juxtaposition; a knowledge of these facts by itself will never produce fine results artistically, but they may be used by the artist as safe guides for the direction of the studies. The difference between light and pigments in relation to colour is noted, and the laws regarding complementaries, contrast, and small interval are explained and commented upon. The propositions regarding the use of colour laid down by the late Owen Jones in his "Grammar of Ornament" are examined with relation to past examples of architecture and analogy from nature. II. Attention is turned, secondly, to the colour qualities of our materials and the range of materials we have at our disposal, and it is found that there is no colour which has not its exponent in almost every material the architect makes use of. The various materials are passed in review, with reference to their effect from a colour point of view; stones, marble, of which it is thought more extended use might be made over small surfaces in external work; cement used as granolithic, rough cast and (as a form of small decoration) sgraffito; the various woods, singly and in combination, with a remark as to the greater use of inlays; bricks, tiles and terra-cotta; the metals, mosaic and other forms of internal and external decoration. With regard to these last, the more extended collaboration of artist craftsmen

is pleaded for as the only means of producing the finest results. III. In the third place, attention is directed to the use of colour in the architecture of the past. It is found that colour has always played an important part, and a rapid survey is made of pre-Classic days of Greek and Roman, Romanesque and Byzantine, Mauresque, Gothic and Renaissance architecture, with a more careful examination of some Italian examples illustrated—St. Mark's at Venice, with the Ca d'Oro and other palaces there, the churches of Sienna and Florence and the houses of Bologna and Perugia. The use of coloured materials and pigments in England and Scotland in past times is inquired into and illustrated. In conclusion, the tendency towards a more widespread use of colour in the present day is noted and welcomed, and particular reference is made to buildings in Edinburgh and Glasgow giving evidence of this. The counter influence of fog and smoke is discounted, as much of an architect's work lies in the country beyond their reach, while it is further contended that even if a colour effect in towns is limited to a few years' duration it is none the less worth being carried out, for that beauty is none the less beautiful because it is transient.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE usual monthly meeting was held in the studio of Mr. Wm. Guthrie, West George Street, who delivered a lecture on "Glass Staining." He introduced the subject by referring to the different varieties of glass employed by the glass-stainer, with an explanation of their qualities and appropriateness when used in different combinations. By means of a large number of examples he illustrated the practical execution of the work and the different methods of obtaining effective results. A short discussion followed, and at the close a hearty vote of thanks was awarded the lecturer.

NOTTINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual dinner of this Association was held at the Clarendon Hotel, the president, Mr. James W. Woodsend, in the chair, supported by the vice-president (Mr. George Fish), Mr. Councillor Wright, Messrs. T. Barlow, W. Bretnell, H. Buxton, T. Cuthbert, Dennett, jun., Gell, jun., H. Williamson, H. C. Gilbert, H. Gabbittas, E. Garton, J. Burton, A. Hinsley, Hodgson, jun., B. Keeling, E. Kent, F. Messom, G. A. Pillatt, A. Priestley, R. Simpson, J. G. Thomas, James Wright, F. Wartnaby, F. W. Whittaker, J. Whitehouse, Brownell, T. Skerritt, Attewell, J. Cooper and other gentlemen. Letters of regret for non-attendance had also been received by the secretary from several members.

The toast of "The Queen and Royal Family" having been loyally honoured, the vice-president (Mr. Fish) gave "The Town and Trade of Nottingham," coupling with it the name of Mr. Whitehouse, who suitably responded.

Mr. Messom next proposed "The Visitors," to which Mr. Brownell humorously replied.

Councillor Wright proposed "Success to the Nottingham Master Builders' Association," impressing upon the members the importance of being united for mutual protection.

Mr. Woodsend, in responding, said he quite agreed with the remarks of the previous speaker, and assured the members present that he was always ready and willing to do all he could to help on the best interests of members and the trade.

The following resolution was unanimously carried, with the request that the secretary would send copies to the railway companies serving the town:—"That this annual meeting of the Master Builders' Association of Nottingham, held Thursday, February 9, 1893, protests most strongly against the unwarrantable increase of railway rates to the building trades, and respectfully requests the various companies serving the town and district to bring the rates back to such levels as will be conducive to the preservation of the trades referred to."

At intervals during the evening songs and pianoforte solos were given by Messrs. Elsey, Gibson, Pym, Townsend, Wright and other gentlemen.

The usual votes of thanks were passed, to which Mr. Woodsend briefly replied. He said that their thanks were more especially due to the musical friends, who had done so much to make the evening so enjoyable and such a thorough success.

THE new Wesleyan church erected at Penryn, Cornwall, from the designs of Mr. J. Wm. Trounson, F.R.I.B.A., architect, Penzance, was opened by Dr. J. H. Rigg, D.D., president of the Wesleyan Methodist Conference, on Tuesday, the 14th inst.

BUILDING SOCIETIES.

AN abstract of the accounts furnished by building societies incorporated to Dec. 31, 1891, including Great Britain and Ireland, under the Building Societies Acts, was issued on Saturday. In the United Kingdom there are 2,767 of these societies, of which 170 were established in 1891. The 2,382 societies which make returns as to the number of their members have a total membership of 587,856, an average of 247 to each. The amount of their receipts during 1891 was 19,463,611*l.*; of their liabilities to the holders of shares 34,729,966*l.*, and to depositors and other creditors 14,911,514*l.*; 1,496 societies had balances of unappropriated profit amounting in all to 2,132,388*l.*; and the balance deficit of 495 societies reached the sum of 235,177*l.* The assets of the societies are stated as follows:—Balance due on mortgage securities (not including prospective interest), 47,703,054*l.*; amount invested in other securities and cash, 3,842,953*l.*

THE A. A. LYRIC CLUB CINDERELLA.

[BY A LADY CORRESPONDENT.]

ON Wednesday, February 8, this club held a most successful dance at the Portman Rooms, Baker Street, about 300 being present. The enjoyment of the dancers was greatly enhanced by a perfect floor, good music and pretty surroundings, and undoubtedly all spent a very pleasant evening, it being the generally expressed desire that the club might make the dance an annual institution.

The success of the evening was to a very large extent due to the exertions of the hon. secs. to the club, Messrs. Scott and Murray, and Mr. Theo Moore acting as M.C.s, also, the president, Mr. Ernest Rüntz, and the numerous stewards. All were unceasing in their efforts to promote the comfort of the guests. A pleasing feature of the evening's enjoyment was a song, "For all Eternity," very feelingly sung by Miss Jessie Hotine, accompanied by Mr. Theo Distin (Violin Obligato); at the Pianoforte was that old friend of the A. A. Lyric, Mr. C. Tenhof; Mr. Roland Henry also contributed a musical sketch, "Our Boarding House," in his well-known humorous style.

It would take up too much of your space to give the list of those present, but I was pleased to see Mr. H. O. Cresswell, as president of the A. A., applauding the efforts of the Lyric Club. Many A. A. men brought friends and beves of fair girls (architects' assistants upon this occasion only), for, after all, they could not well dispense with them, and we were quite up to the occasion, and only too ready to show they were dependent upon us for success just once in a way.

The dance came to an end punctually at twelve o'clock, and amidst "Good-nights" and congratulations, we heard the following:—"Hope they will give a dance next year. If so, let me have four with you instead of two, won't you?"

I must not forget to mention the excellent arrangements made for the club by the secretary of the Portman Rooms, and the capital band of the company under the direction of Mr. Russell.

The Future of Architecture.

SIR,—To the British art-student with an open mind the above phrase must seem absurd, for he must necessarily feel that there is no architecture, properly so-called, at the present time in England. Those who now claim that most honourable title are really very clever archæologists and excellent men of business, who, by travel, exploration and study of the ancient buildings of past ages—ages quite out of harmony with these present days, and therefore quite incapable of furnishing a mode of building suitable to our advanced civilisation—persuade the British public of these degenerate days that nothing better can be done than to ignominiously copy the picturesque but very debased architecture of the Jacobite, Georgian, or other remote period. But I feel sure they will excuse me saying they are not architects in the strict meaning of the term. To do something now exactly as it was done centuries ago is, in their opinion, to deserve praise, honour and reward; but, nevertheless, it does not make them architects. If the end and aim of archæology were nothing more than to give us history and beautifully-illustrated books there would be nothing for an admirer of architecture to complain of, but as we now see frightful Dutch gables, columns and pilasters resting upon brackets, keystones, and voids and other monstrosities in every street, it is time someone possessed of a little historical insight, the logical and philosophical spirit, and a love of art should no longer hesitate to protest and speak out.

Practical architecture, as all ante-Reformation monuments prove beyond doubt, was a progressive art in perfect harmony with the state of civilisation existing at the time they were built, and until architecture is again based upon the same principle we shall not know what English architecture really is, we shall make no real and vital progress in architecture, we shall never have what Italy, France, England and other glorious art-kingdoms once had, a national architecture at once beautiful and convenient and in harmony with our present advanced civilisation. If this be true—and I challenge anyone to prove the contrary—the British art-world has one of the most important and interesting problems before it awaiting settlement.

The last fifty years show the most wonderful advances in almost every branch of science, politics, commerce—in a word, in civilisation. Shall architecture alone stand still, nay, go backwards for its inspiration into the dark ages of ignorance and superstition? Surely not, and I—a sinner like all the rest, but penitent withal—therefore ask that something be done by those who have her real interest at heart to strike off her present unworthy bonds of restraint, that she may again have the healthy freedom she always possessed in the past, when she was worthy of her glorious destiny as "mother of all the arts." If this letter shall prove that there is sufficient public spirit in the profession to attempt a reform, there will be time enough to determine the particular ways and means to accomplish it—whether, in the first instance, it shall take the form of a deputation to the Government to appoint a commission to inquire and report on the formation of "a society for the encouragement of originality in architectural design," or some other measure to be determined upon at a meeting of those interested in this idea, need not be now discussed. Doubtless, sir, you will be willing to receive any preliminary proposals, and make them known to your numerous readers, and then steps can be taken accordingly, whereby it may be hoped that we may yet see in this nineteenth century the conception and birth of a national style of architecture thoroughly appreciated by the nation at large, and worthy of its admiration.

HERMES.

GENERAL.

M. Henri Mayeux has received the appointment of Professor of Decoration at the Ecole des Beaux-Arts, Paris, in succession to the late P. V. Galland.

Mr. A. Gilbert, R.A., was on Monday evening elected a member of the Institute of Painters in Water-Colours.

The Design for the proposed Opéra Comique in Paris will be obtained by competition, although some designs have already secured the approval of the authorities.

The Surveyors' Institution meet on Monday, the 20th, when a paper will be read by Mr. G. M. Freeman, entitled "The Arbitration Act, 1889."

The Royal Scottish Society of Painters in Water-Colours have held a meeting in Edinburgh, at which it was unanimously resolved to hold an open exhibition of water-colour paintings in the National Galleries on the Mound during the months of June and July next.

The "Manchester Guardian" says:—We are glad to learn from a German contemporary that Mrs. Schliemann has generously placed at Dr. Dörpfeld's disposal funds for a new campaign of excavations at Troy. Many questions yet remain unanswered, and the result of the new three months' work will be eagerly looked for. Dr. Dörpfeld starts in the middle of April.

The Council of the Manchester Academy of Fine Arts have arranged the press view of the Spring exhibition for Saturday, varnishing day for Monday, private view (with conversation in the evening) for Tuesday, the exhibition opening to the public on Wednesday, 22nd inst.

An Association of Painters and Sculptors who represent horses has been formed in Paris, and a selection of works by members will be shown at the next "Concours hippique."

Sir Thomas Deane, R.E.A., read a paper on ancient monuments in County Kerry, at the meeting of the Royal Irish Academy on Monday. He claimed that ancient monuments were more numerous in parts of Kerry than in any part of the United Kingdom. Among the most noticeable were the beehive cells, which in the neighbourhood of Dingle and Ventry literally covered a large district of country. Within recent years much more care had been taken of these monuments than in former times.

A Memorial of Heinz Toppler, the renowned burgomaster of Rothenburg, who lived in the fourteenth century, is to be erected in that town at a cost of over 1,500*l.*

The Architect.

THE WEEK.

THE death of Mr. JOHN PETTIE, R.A., on Tuesday, removes a painter of whom any country might be proud. He possessed some of the good fortune of his countrymen when he was able to secure a place on the line for the first picture he sent to the Academy in his twenty-first year, and to gain an Associateship in his twenty-seventh year. But his success did not spoil him, and as time went on his works improved. His style was a manly one, and he was not ashamed of a predilection for Scottish subjects. He was one of a band of students that owed much to ROBERT SCOTT LAUDER, a teacher who exercised great influence in Edinburgh. Mr. PETTIE could paint portraits of men in the modern sober garments, but he was more successful with heads when his sitters wore the armour or the plaids of a past age. He was essentially a painter of costume, but his figures never suggested models that bore clothes to which they were not accustomed. His *Sword and Dagger Fight*, *Terms to the Besieged*, *The Traitor*, *The Flag of Truce*, *The Defiance*, *Hunted Down*, and historical pictures like *The Disgrace of Cardinal Wolsey*, *The Duke of Monmouth before James II.* and *Bonnie Prince Charlie*, may be cited as examples of his skill in suggesting a story and in treating costume. That he was not deficient in humour was evident from his *Two Strings to Her Bow* and *Touchstone and Audrey*. As a colourist, he was every year increasing in power. Mr. PETTIE was born in Edinburgh in 1839, and he used to be taken for a strong man. Unfortunately an abscess was formed in his brain, and, although it was removed on Monday, the effects from it were fatal. His death will be deplored by many friends.

THE difference between Chancery and Common Law in respect of common interest has been exemplified in the Queen's Bench Division at the expense of a builder. Mr. TEMPLETON, of Hull, has suffered in his business, as he alleges, by the action of several of the local trade societies, and he sought to take an action against the presidents and secretaries for malicious conspiracy between themselves and members of the societies. He claimed 1,000*l.* damages and an injunction to restrain the defendants from injuring him. The trade unionists, when they received the writs, objected to having responsibility thrust on them on account of any corporate action. Lord COLERIDGE and Mr. Justice HAWKINS made it apparent from the first that they were opposed to the action; they considered it was only an effort to cast liability on the societies contrary to the Acts which exempted them from that sort of responsibility. It was held that common interest could not be shown, or that the officers and men had united to injure either the plaintiff or anybody else. According to one of the rules, "where there are numerous persons having the same interest in one cause or matter, one or more of such persons may sue or be sued, or may be authorised by the court or a judge to defend in such cause or matter on behalf of or for the benefit of all persons so interested." But no evidence was brought forward by Mr. TEMPLETON to suggest that any one of the officers inspired the attack upon him. It is not enough to be suspicious and to imagine that there are reasonable grounds for believing in the guilt of a party; the Courts must be furnished with other grounds. From the breakdown in the preliminaries of the action we imagine there is not much use in further proceedings. The trade unions know too well in what their safety consists, and the officers are about the last of the members that would run any risk for the cause.

ALTHOUGH the conditions were not revolutionary, there was opposition in England to the Act which places prehistoric structures under Government protection. With the experience of the advantage which the Act confers, it would still be difficult to pass a similar measure for the protection of structures of a later date. We must not therefore condemn the Indian family of Mudaliars, the priests and others who sought to obtain a very large sum of

money from the Indian Government as the price for refraining from actions that would imperil the Seven Pagodas of Mahabalipuram. FERGUSSON describes them as the raths or monolithic temples that stand on the seashore at Mahavellipore, and as examples of Dravidian rock-cut temples which "are as early, if not indeed earlier, than the fifth or sixth century, and are in reality the oldest examples of their class known, and the prototypes of the style." The granite in the neighbourhood is in demand for works in Madras, and it was apprehended that the temples would be injured during the blasting in the quarries. The Indian Government wished to secure the temples, and an official offered 190 rupees for them. The sums claimed amounted to about a million of rupees. Probably the monoliths were valued like carvings in ivory. When the case came before a district court the claims were reduced to 25,800 rupees for temples and works of art and 113,800 rupees for unquarried stone. The stone was estimated at 25,000,000 cubic feet. The judge declined to set any value on the temples, as it was not proved that an income was derived from them; but he considered the quarries were worth twenty-five years' purchase of an assumed rental value of 200 rupees a year, or 5,000 rupees. A sum of 124 rupees for some plots was not disputed. Costs were not awarded. All parties were dissatisfied, and the case was brought before the High Court of Madras. It was decided there also that the temples had not a market value. As regards the stone, the actual rent was taken as the basis—that was 140 rupees and fifteen years' purchase. The value was therefore reduced to 2,100 rupees. But the High Court considered that the quarrymen and others, to the number of forty-six, had claims which were legal. Taking the sum as 100 rupees each a year, ten years' purchase, or 46,000 rupees was allowed. The Land Acquisition Act of 1870 allowed 15 per cent. on the value for sales under similar conditions, and the Court also admitted it. The litigants appealed to the Judicial Committee of the Privy Council, and on Saturday judgment was given. It was decided that the district judge was right in basing the amount of damages on an assumed rental, and for giving twenty years' purchase to the zemindar. But the rights claimed by the forty-six quarrymen were not recognised. The original award of 5,124 rupees was allowed to stand, with the addition of 15 per cent. on account of enforced sales. Each side bears its costs. The case is remarkable as evidence of a desire on the part of the Indian Government to preserve the examples of native architecture, and as the zemindar and the villagers will hardly receive enough to pay law expenses, probably future claims for compensation will be less preposterous.

THE following recommendations concerning practice have been formalised by a special committee of the Philadelphia chapter of the American Institute of Architects:—Members may not consistently advocate unpaid competitions. It is the sense of this chapter that all competitions should be decided by a professional referee. A member endeavouring to establish a competition for the purpose of securing work already pledged to another architect will be expelled from the chapter. Members must make the conduct of competitions in all cases strictly in accordance with the conditions imposed, and insist that all competitors receive the same data and privileges as to time, &c. A member may not consistently make any offer of professional service to a party who has already retained another architect; such conduct renders the member liable to expulsion from the chapter. Professional courtesy requires that a member shall not give his services where another architect is already employed, without the approval of that other architect. The chapter reaffirms its adoption of the schedule of charges of the American Institute of Architects. A member may not consistently depart from the provisions of that schedule. A member offering his services for any less consideration than is embraced in that schedule for the purpose of securing work for which another architect is competing will be expelled from the chapter. Members may not consistently act in any way contrary to the expressed or implied policy and spirit of this organisation, membership in which carries with it the obligation of sustaining the best professional standards.

THE GRAFTON GALLERY.

THE opening of a new gallery in Grafton Street is a feat that is not without importance to other people besides the owners and staff. Apparently the exhibitions in it are to satisfy desires which the numerous galleries in London make more urgent. In a way the majority of the exhibitions of pictures are modelled on those of the Royal Academy. What is seen in them is adapted for visitors who love jog-trot ways and tolerate monotony as long as it is "safe." The Grosvenor Gallery for a time was a disturbing influence which seemed likely to become fascinating for those who used to believe that Burlington House could hold its own against all foreign devices. In a few years, however, the Grosvenor fell under the sway of a *clique*, and the exhibitions could not then be beneficial to English art. It was well they came to a close.

If we can judge from the first exhibition the Grafton Gallery will do more than compensate for the collapse of the Grosvenor. The latter was never without a sort of Mayfair refinement, and there was a preference for artists who might be considered decorative at *soirées* or even at garden parties. Accordingly there were pictures which were supposed to be inspired by the classics and writers who were unknown to the commonalty. The portraits might be illustrations of a peerage. The Grafton Gallery is also an aristocratic experiment, but the exhibition abounds with the works of men who are not ashamed of their Bohemianism, and who have to be sought in the quarters of foreign cities which are not recommended for inspection by the guide-books.

We may see in the Grafton Gallery many pictures which would never be painted if the artists gave much attention to the markets. It is not an exhibition for a man who buys for investment, and the dealers who control English patrons will probably declare it to be faddish. The painters, however, are likely to have realised the fate that was before them, and they may not expect to be more captivating in London than elsewhere. They have a right, however, to claim that attention for their works which is the due of all honest efforts to free art from limitations which are felt to be oppressive. If tested by the standard adopted by many prosperous artists, the majority of the paintings will no doubt appear full of errors; by some critics they may be supposed to be hardly entitled to be treated as works of art. But the men who produced them have also principles, and if there is error it arises from too faithful an adherence to what is accepted as the true logic of art.

There is no doubt, however, that opportunity is given to judge the pictures. The light does not obscure or soften defects, and not one work is too remote for scrutiny. It must be allowed that Messrs. WIMPERIS & ARBER, the architects, have, in spite of the difficulties of the site, set up excellent galleries, and by their efforts the study of pictures becomes less onerous than in most of the galleries in the district.

It is satisfactory to find there are some artists, whose authority is unquestionable, who have helped the new venture. Mr. WATTS, who is always generous towards experiments, has contributed a couple of figures, *Thetis* and *Daphne*, which show how well he can compel his hand to work on a small scale, and a vigorous head of a boy. Mr. ORCHARDSON'S *Mr. W. Gilbey* appears once more in public, and Mr. WHISTLER'S *Lady Meux* has a position which suggests its importance as a sort of canon (if such a possibility is allowable amidst so much independence). Mr. BOUGHTON, A.R.A., has a small landscape and a head of a girl seen in profile. He is one of those artists who might be expected to rejoice at having a gallery in which a forgetfulness of conventionalities is not culpable. Mr. ALBERT MOORE is a far abler artist than many an Academician, and his *Toilet* would be a welcome addition to any gallery. Foreigners will appreciate the skill which produces so much effect with a very few colours. Mr. DAVID MURRAY has three landscapes. The director of the Antwerp Academy, M. ALBRECHT DE VRIENDT, is represented by his *Pope Paul III. Contemplating the Portrait of Martin Luther*, which has been reproduced in *The Architect*. The *Dolores* of M. JOSEPH ISRAELS is a single figure, or rather bust, of a peasant woman in mourning, who, judging by the size of

the hands she is wringing, must have often toiled in the fields. It is impressive, like all the painter's works, but he might occasionally recognise that life is made up of other scenes besides those which precede and follow funerals. M. H. W. MESDAG has also lent one of his countless views at Scheveningen. Although it is pleasant to see such works as we have mentioned, they do not, with the one exception, appear related to the majority of the paintings. They serve, however, as foils, and may indicate how much has been lost as well as gained by the men who prefer the laws which every individual artist can make for himself.

It was right to place Mr. F. BRANGWYN'S *Buccaneers* near the entrance, for it may be considered as one of the paintings which impart character to the exhibition. The artist has hitherto painted his sea-pieces with a restricted palette, where dark blues were paramount. In this painting he has lavished reds. It shows a boat returning from an attack with a cargo of wounded ruffians. If in appearance they all resembled the besotted steersman, it is fortunate that so many of the heads are bent. The large work has the appearance of a first thought expressed in haste, and power is manifest throughout. Unlaboured as it looks, it has the realistic force of a chapter in DE FOE. Mr. BRANGWYN'S *Eve* will not appal those who are familiar with the modern representations of the subject. This red-haired woman is not dignified in appearance, and must be considered as deficient in moral character. The purple serpent that stretches along the tree could easily persuade so greedy a being. It is courageous to give a new version of a subject which so many artists have united in treating in a uniform manner, but the artist's invention might be employed with more advantage in interpreting other stories. The first name in the catalogue is Mr. ROBERT MCGREGOR'S (and Scotsmen have somehow secured a remarkably large share of the wall space), but his picture does not attract attention like the *Lobster Fisher* of Mr. COVENTRY, of Glasgow, which is a showy work. Mr. CAMERON makes his view of Amsterdam out of boats and barges, and has, therefore, failed to catch the spirit of the place. Mr. DAVID GOULD is forcible in his leafy June. Mr. WYLEY GRIER'S *Bereft*, a little girl taking a lamb from beside a dead sheep, which the crows are attending, is not without pathos, and the subdued colouring is in keeping with the scene. M. FRANZ VON LEEMPUTTEN'S *Return of a Pilgrimage* is a novel scene—a crowd of peasants coming along a flat road, their friends awaiting them in the foreground. It is no easy work to paint a white tea-cup; but M. GANDARA, in his *Le Thé*, shows not only cups but saucers, teapots, &c., so effectively that the character of the porcelain could almost be inferred from the painting. The lady who presides is only dimly seen, in order that the effect of the service may not be lessened. The picture is a *tour de force* which would not be out of place in the Wurtz Gallery at Brussels. M. GARI MELCHERS has two church scenes, *Faith* and *The Wedding*, in which some Dutch peasants in quaint costumes are seen assisting at services which appear to bring discomfort. M. LILJEFORS, of Upsala, is a believer in light blue, and contrives to use a good deal in his *Disturbed Repast* of a fox. M. SEGANTINI, of Milan, must possess some process of his own for producing rough soil, as otherwise the very elaborate effect which he obtains would need long and patient labour. In *Melancholy Time* we see a desolate shepherdess, who has only a cow to sympathise with her, and the uncultivated ground seems a fitting scene for such trouble. In the *Punishment of Luxury* his process no less serves for the dreary and arid region through which the erring are impelled.

In the Music Room there is much variety. Mr. G. HENRY, A.R.S.A., has *A Galloway Landscape*, that at a distance might be taken for a map in relief. M. HOECKER'S *Ave Maria* is the Annunciation, where the Blessed Virgin appears kneeling, and a cross of white light is seen in the sky. Mr. A. ROCHE, of Glasgow, has an *Idyll*, a scene near a river, that is decorative and original. Mr. STOTT'S *Pasturage by the Sandhills* has more reality as a landscape than his *Iseult* as a figure-piece, for the latter might be derived from a performance of WAGNER'S opera at a minor theatre. Miss NORDGREN'S *In the Woods*, *Lissadell*, *Sligo*, suggests an Irish trait, for the girl is walking barefoot, although she possesses boots, which she carries, in order to

save them for the town. M. ALFRED STEVENS has a remarkable *Storm Effect*, which will be a surprise, for he generally confines himself to pictures like his *Coquetterie*—a lady admiring herself in a mirror—which is, however, not one of his best specimens. Mr. LAIDLAY introduces plenty of detail in his *Tidal Marsh*, a subject that might not be supposed as adapted for such a treatment. The trees in Mr. E. A. WALTON'S *Pastoral* are vigorously handled, but they would be still more effective if the clouds were further distant from them. Mr. HORNEL'S *Summer* is very curious, a sort of Japanesque scene with a couple of ugly red-haired children. Mr. HARRINGTON MANN'S *Youth of Paris*, a boy piping for his goats and who is endowed with shapeless legs and big feet, hardly suggests a figure that was to become "graceful as a god." This is explicable when it is known the artist comes from Glasgow, for in the North anatomy does not appear to be a requisite study for a painter. M. VERHEYDEN has a capital open-air study, *A la Campagne*. M. RAFFAELLI'S *M. Clémenceau at an Election Meeting* fills a very big canvas, yet it might have been sketched at the meeting. The ugliness of the faces and figures is painfully true, and anyone who looks at the orator's arms need not wonder that so many Frenchmen were compelled to cast away their muskets in the last war. Mr. HENRY SIMPSON has hit on a pleasing subject in his *L'Amour Prisonnier*—a child entangled in a fishing-net who will not be extricated by some laughing girls. The draperies and backgrounds of M. LYBAERT'S two religious pictures might have been painted five centuries ago, but the faces reveal too much of modern consciousness. M. BESNARD'S first experiment of casting a bright yellow light over a lady's face was novel, but what is the advantage of repeating the effect, as in the portrait of Madame R. J.? M. HOLZEL'S *End of Summer* represents a girl at a table of an out-of-door restaurant; the lighting is admirable. Mr. ARTHUR MELVILLE'S portrait, a lady seated at a white piano in a room hung with Japanese paper, deserves attention for its originality and effectiveness.

M. FANTIN LATOUR'S *Zinias* and *Double Larkspurs* are masterpieces. The proximity of Mrs. STOKES'S *Passing Train*—a girl with a scarlet cloak looking over a hedge—does not affect the former. M. TATTEGRAIN'S *Entry of Louis XI. into Paris* was in the last Salon, and secured much attention. The Parisians appear in good humour, for they did not anticipate the cruelty of the king, or the influence of TRISTAN L'HERMITE. His Majesty has just passed a *tableau vivant* of the Crucifixion, and the characters gaze after him, while he is engaged in listening to syrens who stand up to their waists in a tank of water. The whole scene is vivid, but the horse on which the king is mounted is so wooden that the merit of the rest of the work is likely to be overlooked. Mr. LORIMER'S *Pleasant Labour*, a farmer filling a sack with potatoes, to the delight of a group of children, is worthy of a place in any exhibition, for it is a pleasure to look on so unaffected a piece. M. KHNOPFF'S *Samuel and the Witch of Endor* is very curious as a combination of black and yellow. Professor VON UHDE, in his *Lord, Abide with Us*, interprets the scene at Emmaus as if it happened to-day. CHRIST is like a poor monk, and the disciples are peasants. The Prince TROUBETSKOY shows ability in his portrait of Mr. Justice DAY, who appears without his crimson and ermine robe engaged in reading a newspaper. The face presented difficulties, which are overcome by the aid of vigorous light and shade. M. THAULOW'S *Pont Louis Philippe* is so thoroughly careful in all its parts, it might have been painted in days when Impressionism was unknown. M. ANKARCORNA'S *Norwegian Horses* are sculpturesque rather than animated. M. CHARLES MEUNIER paints colliers wheeling coals in one picture, and in the other shows as dismal a colliery village as could be discovered in the Midlands. Mr. R. B. NISBET'S *Dundee from the Fife Coast* is almost a monochrome, yet somehow it does not appear out of place in the gallery. Mr. W. GEETS represents an exhibition of marionettes before the young CHARLES V. in a style that is popular in Belgium, and the figures are ably characterised. A novelty in portraiture is commendable, but it is not likely that M. RYSELBERGHE'S plan will be often imitated. He places his subject in the dress-circle of a theatre, of which part the lady is the only occupant, although the rest of the house is crowded.

In the end gallery much will be found that is interesting. The Hon. JOHN COLLIER'S *Wood Nymph* is seen reclining on a tree over a lake. M. HANS HERMANN paints the *Fish Market of Amsterdam* so darkly that the red on the inside of a tub gives unusual gratification. M. MUHRMAN'S sombre *West Heath, Hampstead*, suggests that the artist believed the English climate could not be sunny. *The Interior*, by Professor KUHL, of Munich, depicts a workshop with several lathes; a man stands at one, and a woman is busy seated on the floor. It is a bright, sunny day, and trees are close to the window. It is a pleasant picture of labour. M. DEGAS is one of the leaders of the young painters of Paris. He has one sketch in crayons, *The Little Student*, which was hardly worth showing unless to suggest that the artist prepares for a picture in a rough and ready way. *The Absinthe* is as true to Paris life as the big picture of the political meeting. It shows a modern Parisian of the *voyou* class and his lady companion taking their pleasure sadly at the table of a wine-shop. It is more true than a photograph, for there is no posing of the pair. Mr. MARTIN HARDIE'S *My Heart is Sair* is as quiet and unpretentious as a work of the last century. M. CARRIÈRE BELLEUSE paints a *Ballerina* who is modest. Mr. CHARLES PEARSE is one of the most successful of the American painters in Paris, and his *I Have that Within which passeth Show*—a girl with a child—has the rare charm of being suggestive of something more than worldly affection. *The Terre Promise*—a crowd of children gazing eagerly through the glass door of a toyshop—will uphold M. LOBRICHON'S reputation as a painter of young folks.

Among all the landscapes the most important is *The Mill in the Valley*, by Mr. HUGHES STANTON. It shows a wide expanse of country that is of varied character, and the whole is treated with a breadth that does not allow any part to diminish the unity of the scene. The two works by M. GERVEX are not enough to explain the extent of his reputation as a painter. M. PAUL MAITLAND is modern enough, for he has painted a public-house at night, brilliantly "lit by a Sugg gas-lamp," and with much effect.

The Armenian Convent, Venice, from its hardness and dulness, must be an example of one of the early styles of Miss MONTALBA. Herr MATIEGZECK'S *The End of the Holidays*—two girls in a railway carriage—reveals that in Germany, as in England, young people can be bored by their outings. Mr. J. E. CHRISTIE is a painter who ought long since to have secured much more prominence in art. His works are never commonplace. His *Bogey Burn* represents two children near water which has become dyed by leaves and flowers. It is like a new version of the "Babes in the Wood." M. CHEVALIER TAYLOR, in his *Harvesters of the Sea*, presents a number of fisher-girls, everyone of them being in profile, with side views of the boats in the distance. Mr. LAVERY'S *Lord McLaren* is a very quiet, elderly judge in a black gown and a wig, seated amidst an abundance of books and papers; his *Mrs. Jan Hamilton* will probably secure more attention. *The Attrapade*, by M. FELICIEN ROPS, depicts an altercation between two over-dressed women on a staircase. It might have served for a design for a woodcut in one of the penny dreadfuls of Paris. M. ROLLS has a portrait of *M. Tirard*, which at the present time is likely to suggest a dangerously plausible gentleman. The paintings which are as lightly coloured as cartoons, by Mr. WELDEN HAWKINS, deserve as much attention as any work in the gallery. The outlines are most vigorous, and the heads are something more than portraits. Among the drawings on the screen the portraits in pencil by the Marchioness of GRANBY are worthy of Mr. G. RICHMOND.

There are a few pieces of sculpture on a small scale scattered through the rooms, the most remarkable being a head of *St. John the Baptist*, by M. RODIN. Taken as a whole it must be admitted that an attractive show has been prepared, and one that promises well for the future of the new venture. The collection has a claim to be accepted as inter-European, if not as international, for besides works by English and Scottish artists there are others from France, Germany, Italy, Sweden, Belgium and Holland. It is, therefore, possible to obtain a fairly accurate notion of the latest developments of the painter's art, especially as it is exemplified in non-official studios.

THE WINDOWS IN YORK CATHEDRAL.

FEW cities can boast of more extensive and important remains of painted glass than York. The examples extend over a period of nearly four centuries; but it is the almost unbroken series of glass paintings of the fourteenth and fifteenth centuries which renders this collection so interesting to the student. The greater portions of these specimens are in the Minster; and their value, as evidence of the state of the art at different periods, has been enhanced by Mr. Browne's laborious investigation of a vast mass of original documents relating to the building and adorning of the cathedral—which has enabled him to assign dates to most of the windows with remarkable precision. The earliest painted glass in the city—and probably the earliest specimen in England—is a portion of a Jesse in the second window from the west on the north side of the clerestory of the nave of the cathedral. It forms the upper subject in the westernmost lower light of this window. The date of the glass is about 1200; it is therefore much earlier than any of the Early English glass at Canterbury Cathedral, to which a date cannot be assigned much earlier than the middle of the thirteenth century. A coloured engraving of this very curious example is given in plate 123 of Mr. Browne's history. Much Early English glass, varying in date from the beginning to the middle of the thirteenth century, has been employed to fill the wheel of tracery in the head of the last-mentioned window, as well as the wheels in the tracery of the five next clerestory windows. The upper tier of subjects in the lower lights of the fifth and seventh windows, counting from the west on the north side of this clerestory, are also Early English. An Early English subject is inserted in one of the lower lights of the sixth clerestory window, counting from the west. The wheels in the tracery of all but three of the clerestory windows on the south side of the nave are likewise filled with Early English glass, and Early English glass-paintings are also to be found amongst the subjects in their lower lights. Coloured engravings of some of this glass are given by Mr. Browne. One plate, of great value to the antiquary, represents a series of borders, from the commencement to the middle of the thirteenth century.

The next glass in order of date is that in the Five Sisters, which beautiful pattern windows are of the latter half of the thirteenth century. It is hardly necessary to observe that the glazing of the five lancet windows above the Five Sisters is modern. Some glass of the same character and date as that in the Five Sisters has been inserted in the tracery of the second window from the door in the vestibule leading to the chapter-house. Of the same character are the remains of an Early English window of the latter half of the thirteenth century inserted in two Decorated windows on the north side of the church of St. Denis, or Dionis, in Walmgate.

The glass in the chapter-house and the vestibule leading into it is all of the time of Edward II., and is an extremely beautiful specimen of early Decorated work. One window of the chapter-house, that opposite the entrance, is a restoration by Messrs. Barnett & Sons, of York. It has been carefully executed, and if it does not produce so satisfactory an effect as the original windows, this arises not from the fault of the artist, but from the impossibility of procuring at the present day a material similar in texture to the glass of the fourteenth century.

The next glass in order of date is that in the cathedral, in its clerestory and aisles. This glass is all of the time of Edward III. The contract for glazing the great west window is dated 1330—and none of the glass is probably later than 1350.

The general arrangement and execution of the designs throughout this part of the building are well worthy of notice, as evincing the attention paid by our ancestors to general effects in these matters. The west windows of the nave and aisles, of which distant views may be obtained, have their lower lights filled with large figures and canopies, while the windows of the aisles, with but one exception, are adorned with paintings of a more complicated character, and better calculated for a closer inspection. Much of the plain geometrical glazing in the clerestory windows is original, and, like that in a similar position in Cologne Cathedral, affords a proof that the ancient glass-painters did not consider themselves bound to finish patterns destined to occupy a distant position as highly as those placed nearer the eye. Some decorated glass of the same character and date as that in the nave has been placed in the first window from the west of the south aisle of the choir. The second and third clerestory windows from the east on the south side of the choir contain similar glass, which it is likely has been removed thither from one or other of the two flank side windows of the north and south aisles of the nave.

Many of the churches in York possess good decorated glass in their windows, in particular the east window of the north aisle of All Saints, North Street, and the westernmost window of the north aisle of St. Martin's cum Gregory. There are also the remains of a decorated Jesse in St. Dene's or St. Dione's

Church, and some very perfect decorated designs in the first and second windows from the east on the north side of that building.

The earliest Perpendicular glass in the cathedral is contained in the third window from the east in the south aisle of the choir, in the third and fourth windows from the east in the north clerestory of the choir, and in the fourth clerestory window from the east on the opposite side of the choir. These windows are of the latter part of the fourteenth century. There is also an early Perpendicular Jesse in the third window from the west in the south aisle of the choir. The date of the east window of the choir is well known—a contract for glazing it in three years was made in 1404. This window is one of the best executed ever seen. The beauty of the figures, however, cannot be fully appreciated without inspecting them closely from the gallery near the window. The other windows of the choir aisles, eastward of the small eastern transepts, as well as the glass in the lancet windows on the east side of the great western transepts, appear to be likewise of the time of Henry IV. All the rest of the glass in the choir is of the reign of Henry V. and Henry VI., the greater portion being of the latter reign. The chief peculiarity in these windows is that the white glass which enters so largely into their composition is, generally speaking, less green in tint than usual. It appears from the Fabric Rolls that the white glass is of English manufacture, which circumstance may serve to account for its whiteness. There is some very good glass of the time of Henry VI. in the east and other windows of All Saints Church, in North Street; the east window has not been improved by the restorations, which appear to have been made in ignorance of the fundamental principles of the Perpendicular style of glass-painting. St. Martin's Church, Coney Street, contains much painted glass of the time of Henry VI. of good character, and valuable as affording an example of a general arrangement of designs throughout an entire building. Some glass of the reign of Henry VII. has been inserted in the four upper south windows of the great west transept of the cathedral. The heads of some if not of all of the figures are restorations. A very beautiful cinque-cento glass-painting, of the latter half of the sixteenth century, has been inserted in the window next the east of the south aisle of the choir. It was presented to the cathedral by Lord Carlisle in 1804, and was brought from a church at Rouen. The design is evidently taken from a painting of Baroccio (who died in 1612, aged eighty-four), but the colouring and execution have been varied to suit the nature of the material employed. From the column-like arrangement of the groups, as well as the actual division-lines of the glass, it may be inferred that this work was originally painted for a four-light window; and it affords a proof that it is not impossible to unite the drawing and colouring of an advanced period of art to the true practice of glass-painting. In the windows by Peckitt, at the south end of the great west transept, the principles of painting upon glass and painting upon canvas are confounded together: in attempting to imitate the depth of an oil-painting by shadows alone he has simply produced opacity, than which no greater fault can be committed in glass-painting. A correct and properly-detailed account of the glass in the cathedral alone would be a most valuable addition to our archaeological publications. Many of the windows in the cathedral are histories in themselves, and contain information which can hardly be collected elsewhere.

ARCHITECTS' FEES.

ON Tuesday the case *Burr v. Ridout* was heard before the Lord Chief Justice and a special jury. The plaintiff claimed 450*l.* as fees and charges in connection with the preparation of plans for two houses. The defendant's plea was that the plans were not used, as they did not correspond with the instructions given, and represented buildings which were too expensive. The sum of 110*l.* was paid into court as a reasonable remuneration for plaintiff's services. Plaintiff denied that in the instructions he was limited to the amount specified.

It appeared that the defendant, who was an estate agent and speculator in buildings, entered into an agreement to build two houses on the Cadogan Estate Chelsea, at a cost of 4,000*l.*, the buildings to consist of shops, with "flats" above as residences. His intention was to erect the buildings at a cost of 4,000*l.* In August, 1891, he asked plaintiff about the sum that would be charged for preparing plans and superintending the works. Plaintiff stated that his fees would be according to the scale of charges of the Royal Institute of British Architects. According to plaintiff the terms were agreed to, and he was directed to prepare plans. When the tenders were sent in it was found that the lowest amounted to 7,067*l.* The defendant declared that he could not expend so much money, and a tender was not accepted. Afterwards the buildings were erected at a cost of 3,500*l.* from plans by another architect.

Mr. Witt, Q.C., for the plaintiff, in his address having stated that the terms, as fixed by the Royal Institute of British Architects in cases where the work was broken off, would be $2\frac{1}{2}$ per cent. on the estimated cost, and if the work went on to the receiving tenders the charge would be $\frac{1}{2}$ per cent. further on the lowest tender,

Lord Coleridge said he would not allow the Institute to dictate to juries what sum was to be paid for work not done.

Mr. Witt said his case was that these terms had been agreed upon, the defendant having been informed that the rules of the Institute would apply.

Lord Coleridge said that unless there was clear proof that they were part of the contract, he should treat the rules of the Institute as mere waste paper.

Mr. Burr stated that he handed to the defendant the rules of the Institute, and the defendant accepted and employed him on these terms. He submitted "sketch drawings" to the defendant, who desired some alterations which would increase the expense. Plaintiff's clerk took out the cubic contents at 116,870 cubic feet, and at 6*d.* per foot the expense would be 4,000*l.* But at that rate the building would be of the plainest possible nature, and defendant said the expense ought to be 9*d.* or 10*d.* per cubic foot. He was informed that meant an expense of between 6,000*l.* and 7,000*l.* The plans having been approved in the estate office, tenders were advertised for, and defendant wrote for the "quantities." The lowest tender was 7,560*l.*, including architects' fees, &c., but excluding them it would be 7,067*l.* The defendant said that was more than he could undertake. He asked plaintiff to send in his account, and he wrote that "the price I had in my mind was 4,500*l.*, including architects' fees, so that there must be a great reduction." Afterwards he wrote that the drawings, &c., were unfit for a speculative builder, the plans being too expensive, and the materials too costly; he also complained of delay, to which the plaintiff replied that they had all been explained to him and that he had approved of them. Plaintiff charged for preparing drawings and specifications, &c., 3 per cent. on 7,067*l.* (212*l.*), and for preparing a bill of quantities 2 per cent. on lowest tender (141*l.*). There was a charge of about 50*l.* for lithographing quantities, &c., 21*l.* for preparing specification of alterations, 10*l.* for surveying site, and some lesser items brought the amount to 450*l.*

In cross-examination Mr. Burr said he was not informed that the expense must not exceed 4,000*l.* The defendant's arrangement with Earl Cadogan was to expend 4,000*l.*, and he had calculated for advances to the amount of 3,500*l.* If he said to defendant that the buildings could be erected for 4,000*l.* that was only an estimate. His clerk estimated the cubic feet at 116,870, and at 9*d.* per foot the amount would be 4,382*l.* Defendant had asked him to reduce the commission for "quantities" to $1\frac{1}{2}$ per cent., but he did not agree to the proposal.

Mr. Kemp, Q.C., maintained that the rules of the Institute did not contain one which was in terms applicable to the case which had occurred—that of the work being thrown up before it was begun. The question therefore would be what was reasonable in such a case. The defendant, who was described as a "speculative builder," and to whom the cost would be vital, had contemplated only an expense of 4,000*l.* The plaintiff was employed to prepare plans and drawings for such an expense, whereas he had prepared plans that would involve an expense of over 7,000*l.*, besides his own charges, which the defendant could not afford, and so the plans were useless.

The defendant said that 4,000*l.* was fixed from the first; that was at 8*d.* per cubic foot, which would come to 4,030*l.* He sent the plaintiff a copy of his building agreement with Lord Cadogan, which was to erect two houses and expend 4,000*l.* The lowest tender was 7,650*l.* The plaintiff said, "We must cut down tremendously," but defendant declared it was not a case for "cutting down." There was a difference of thousands of pounds, and he came to the conclusion that as the whole expense was so excessive he must begin *de novo*, and wrote to the plaintiff to tell him so. He made no use of the plaintiff's plans and drawings. He denied any material alterations in the plans prepared by the plaintiff which would increase the expense.

Lord Coleridge: Your case is that, from first to last, you limited him to an expense of 4,000*l.*?—Yes.

Lord Coleridge: And that on his plans the buildings would cost nearly 8,000*l.*—between 7,000*l.* and 8,000*l.*?—Yes.

Lord Coleridge: That is the case put shortly, "I ordered plans for a cost of 4,000*l.*, and you sent me plans for an expenditure of nearly 8,000*l.*"

The Defendant: Just so. That is my case. I desired no alterations which would increase the expense, which I put at 4,000*l.*

The defendant, in cross-examination, denied making any alterations which would involve additional expense. As to the electric light, all he had authorised was putting up the wires in one house at an expense of 40*l.* or 50*l.* He had desired the work to be done well, but not luxuriously. From the first he

had fixed 8*d.* per cubic foot, which would come to a little over 4,000*l.*

In re-examination he said the work had been done under the new architect, and well done, for 3,500*l.*

Counsel for the plaintiff and defendant addressed the jury.

Lord Coleridge said that the defence rested on this—that the expense of the building was not to exceed 4,000*l.*, which was all the defendant was bound to expend. It was not likely he would expend 8,000*l.*; his case was that the plaintiff, his architect, knew this. If the employment was to prepare plans for a building which could be erected for 4,000*l.*, plans which would involve an expense of nearly 8,000*l.* were certainly entirely different from what was desired. The case for the plaintiff was that the defendant saw the plans and approved of them, and had alterations made in them. Undoubtedly architects did not strictly keep within their employers' limit of expenditure, and on the other hand, the employer was easily induced to countenance an increase of expense here and there upon such pleas as architects knew how to urge. In the present case, although the tenders came near 8,000*l.*, the defendant's letters did not look like a total repudiation. Could the defendant then entirely repudiate the employment of the plaintiff? If not, then it became a question what was reasonable, and that was for the jury to consider. It was said that the Institute of Architects had settled certain charges on the estimated amount of expenditure. But a commission upon expenditure incurred was open to the gravest possible objection. His lordship referred to a case of a gentleman who wished to build a house and was willing to pay 50,000*l.* upon it. His architect prepared plans for one to cost 150,000*l.*, and said, "Well, you may or may not build it, but in any case you must pay me commission upon 150,000*l.*, for the Institute of Architects say so." He confessed his legal soul fired at it; he hoped that no British jury would ever yield to what was a most unjustifiable attempt by a body of men to increase their own emolument. He told them distinctly, that unless they were satisfied the defendant had agreed to pay the percentage, he was not liable to pay it.

The jury found for the plaintiff for 200*l.*, including the sum paid into court.

HEDINGHAM CASTLE, ESSEX.

IT is expected that Hedingham Castle, in north Essex, will shortly come into the market. Little of the ancient castle now remains except the Norman keep, a square building of the same type as the Tower of London and Rochester Castle. It consists of five storeys, and is upwards of 100 feet in height, so that it is a conspicuous object for some miles round. Its walls are from 10 feet to 12 feet thick, and its great hall, on the fourth storey, is still fairly complete. The grooves for the portcullis in the great gate on the western side of the keep are there, but the portcullis itself is destroyed. It is said that Queen Matilda, wife of King Stephen, died at Hedingham. In 1216 the castle was captured by King John from Robert de Vere, third Earl of Oxford, and in the following year it was surrendered to the Dauphin Louis of France, though soon after regained by the Earl of Pembroke for the young King Edward I. The castle remained in the occupation of the Vere family down to the failure of their line and the extinction of the earldom in 1655. The park and surrounding estate extend to about 2,000 acres. The estate itself passed to the Hoghtons or De Hoghtons through the Ashhursts, who purchased it from the representatives of the Veres, and it was by his marriage with the heiress of the Ashhursts that it was acquired in 1783 by Lewis Majendie, great-grandfather of the present owner.

TESSERÆ.

Saracenic Buildings.

THE Saracenic architects worked under conditions that excluded from their use the noblest elements of beauty. But they so employed the materials allowed to them as to produce a style that needs little indulgence on the grounds of its limitations in judging of its merits. It does not possess the highest qualities of architecture, which, indeed, cannot be attained to without the sources of sublimity and beauty opened up by the higher arts; its pointed domes and minarets do not carry up the soul to the empyreal heights, penetrated by the spirit of fretted vault and spire, exploring, as it seems to be, the "veiled infinity" beyond. But this is no dispraise of it, as it cannot be blamed for wanting what is never aimed at—what the religion of Mohammed, which was the great animating principle of the art, did not and could not inspire. It was not the architecture of holiness, but of pleasure, and though applied to mosques it was essentially a palatial style; it was the style

of palaces, of fountains, and of bowers, designed to mingle with and reflect the hues of everything lovely around it in nature, but to breathe nothing higher, even in the mosque; for the heaven of the Mussulman was but an idealisation of earth—a belief with which palaces and temples and tombs are fully in harmony. The religion of Islam involves something purer and higher than this for those capable of receiving it; but the popular notion of it is the one that inspired the Saracenic style, which was modelled in a purely terrestrial mould, the architecture of refined physical enjoyment, in unison with and thrilled with the sentiment of all that is delicious and beautiful on earth. The qualities sought by the Saracenic architects were exquisite elegance and grace of form, combined with minuteness and gorgeous richness of decoration; and in these qualities their architecture may almost be said to be perfect. In some of its branches it seems the very quintessence of richness and elegance; a style made up of graces—the poetry without the prose of architecture, in which all that is most pleasing and agreeable in structural art is brought together to produce the most romantic and fairy-like buildings in the world. If it indicates the predominance of fancy and feeling over judgment, there is no lack evinced of the latter in carrying out consistently the architecture of fancy and feeling which was aimed at, and giving perfection to the style, which approves itself the work of an intellectual as well as of a graceful people.

The Monuments of Mary and Elizabeth at Westminster.

Lofty, highly-enriched canopies formed a striking feature in the early monuments of the Gothic period. The same protecting roof or shrine is found in the monumental design of the post-Medieval time, and equally exhibiting a great quantity and variety of decoration. Colour, gilding, inlaid marbles, armorial emblazonment, scrolls, were profusely employed, as in the same class of design in the fourteenth and fifteenth centuries; but though there is quite as much meaning in the lozenges, twisted columns, urns and other ornaments in these monuments as in crockets, finials, cusps, trefoils and the other fanciful devices of the Gothic canopies, the latter were part of, and in harmony with, the architecture with which they were associated, which the ponderous vagaries of the sixteenth and seventeenth centuries were not. This, independently of other circumstances, constitutes the great difference between the two, and it must be admitted that, in an art point of view, the latter offer no compensating qualities. Two monuments in Westminster Abbey of great historical interest at once offer themselves in illustration of these remarks. They are the tombs of Mary Queen of Scots and of Elizabeth Queen of England. The former stands in the centre of the south aisle of Henry VII.'s chapel; that of the English queen in the north aisle. As in the monuments of the earlier style the effigies of these princesses form the main subject of the design. The inferior character of the sculpture generally is at once evident. Mary is represented in full dress, with her hands raised and pressed together, as if in prayer. The dress is elaborately worked, but is wanting in true artistic treatment, the folds not falling gracefully, but composed in heavy and straight lines, as in a standing figure, and then gathered in unseemly confusion at the feet. The hands have suffered injury, some of the fingers being broken off, but they are small and elegant in form, and the face, young and having a gentle expression, is of a pleasing character. The architectural portions are cumbersome, and every species of decoration that could be crowded into the design is lavishly introduced. The monument of Queen Elizabeth is not on quite so large a scale as that of Queen Mary, but it is composed on the same principle, exhibiting profuse and cumbersome ornamentation totally devoid of taste. The effigy surmounts an elevated table tomb. The Queen is in royal costume, with a small crown on her head. In her left hand she holds a globe, in the right a sceptre. The drapery is in large quantity, ill designed, and, like that of Queen Mary, stands up stiffly instead of falling over to the ground. The order, if it can be so called, of the architecture of these two monuments is Corinthian, and therefore entirely out of harmony with this beautiful chapel of a most enriched character of Perpendicular Gothic. This, however, must be a difficulty with regard to all works of later date that are to be placed in older erections. Unless the style of the architecture be imitated, the more modern works must always appear anomalous. Yet the mere copying, in part, of an older style deprives works of anything like a character consistent with their own date. They lose all contemporary distinction, while they are no trustworthy authority of the style they imitate. A modern statue represented recumbent and in prayer is as fitting a type of a Christian in the present day as it was five centuries ago; but placing such a figure under a Gothic canopy, with all the accessories that mark the peculiar art of a particular and past age of architecture, though it may be very like the older work

and very pretty, is, after all, incongruous. The statue expresses a sentiment, and a beautiful because a true one, but copying the architecture of another age is an anachronism. Every work of art should be truthful, and one of the most valuable recommendations of art is its power to illustrate its own age. If the age has no distinctive expression in its architecture, the difficulty is only increased, for then there can be no real or original design. It must be factitious and borrowed.

Gothic v. Classic Churches.

Most men of education have from their earliest years associated the idea of a church with something of Gothic decoration; and the image of the first well-remembered parish church which rises to conjure up thoughts of tenderness and reverence in the midst of all the sorrow and turmoil of after life, is characterised by a tower or a spire or battlemented porch. Our majestic cathedrals, with one noble exception, are all Gothic, and the almost universal prevalence of this style in our country has secured for it the suffrage of custom, an influence so powerful that Sir Joshua Reynolds is tempted to resolve into it all our perceptions of beauty. For these reasons it may be assumed, in spite of past and possible future fluctuations of the public taste, that Gothic with its varieties will permanently maintain its ground as the ecclesiastical architecture of this country. But not content with this concession, many seem so far to mistake their own arbitrary associations of ideas for the common instincts of humanity as to imagine that this popular style has by inherent qualities of its own some necessary affinity with religious impressions. Many a youth whose awakening taste has been first touched by the glories of the Gothic style is led, in defiance of fact and in ignorance of history, to dream of some mysterious union between piety and genius, of some imaginary period when "Christian art," advancing to perfection, walked hand in hand with holiness of life and purity of doctrine, till at some happy moment both arrived together at their culminating point. All this is entirely fantastic and arbitrary; but there are no limits to the power of the will over the associations; men in this state may so mould their feelings to their fancies as to be devoutly affected where the windows are Geometrical, to be lukewarm where the tracery is Perpendicular, and to be so disturbed by the sight of the Classic orders as to be unable to pray in an Italian church. In truth, however, the power of Gothic architecture to predispose to devotion, independently of the association of ideas, is only that which is shared by every other object of nature or art sufficiently striking to exalt the imagination, and of course can act only on minds sufficiently refined to be amenable to such influences. Neither the Gothic nor, indeed, any other of the many styles adopted in different ages and countries by the Church has any essential connection with Christianity, or can claim to be called "emphatically Christian architecture." The Italians cannot understand what we mean when we complain that their gay basilicas, with their magnificent colonnades and golden rather than gilded roof, do not look like a church. To their eyes they look like nothing else. The Jesuits, who sought by a revival of devotion in the Roman Church to withstand the advancing tide of the Reformation, and in order to effect their purpose studied minutely every movement of the human heart, made their churches attractive and devotional by airiness, lightness and grace, by gay colour and profuse gilding. They did not deny the effect of the dim religious light, the sober splendour and stately grandeur of Gothic cathedrals, but they felt that no style of architecture is privileged exclusively to convey religious impressions; they saw that fashion had declared itself in favour of Classic models, and they dexterously availed themselves of its powerful influence.

Burke's and Reynolds's Æsthetics.

Burke makes beauty to consist in smooth and undulating surfaces, flowing lines, and colours that are analogous to them; while Reynolds maintains that beauty does not consist in any particular forms, lines, or colours, but is merely the result of habitual association, by which particular forms, proportions and colours are appropriated to particular kinds and species, the individuals of which appear beautiful or ugly accordingly as they are respectively conformable or adverse to our ideas of the perfection of those particular forms, which ideas have arisen in the mind from a general and comparative view of the whole kind, class, or species. It will readily appear that these two great critics differ so widely merely from attaching different meanings to the word beauty, which the one confines to the *sensible* and the other to the *intellectual* qualities of things, both equally departing from that general use of the term which is the only just criterion of propriety in speech. The doctrines of Burke concerning beauty have been classed and defined under six distinct heads by the most eminent and distinguished of his disciples, and thus illustrated by a well-known example which, if it prove nothing else, shows at least to what a degree the

most deserving mind may be occasionally deprived even of the ordinary powers of perception by the fascinations of a favourite system. "No building," says Price, "is more universally admired for its beauty than the temple of the Sibyl at Tivoli. Let us then consider what are the qualities of beauty according to Burke, and how far they apply to beautiful buildings in general and to that in particular. Those qualities are:—(1) To be comparatively small; (2) to be smooth; (3) to have a variety in the direction of the parts; but (4) to have those parts melted, as it were, into each other; (5) to be of a delicate frame without any remarkable appearance of strength; (6) to have the colour clear and bright, but not very strong and glaring. The temple I have just mentioned has, I think, as much of those chief principles of general beauty as the particular principle of architecture will allow of; it is circular, surrounded by columns detached from the body of the building, it is light and airy, of a delicate frame, in a great measure free from angles, and comparatively small. I am speaking of it as it must have been in its perfect state, when the tint of the stone and the finishing and preservation of the parts corresponded with the beauty of its general form." So far, however, from being smooth, it is built of as rough, porous and unequal a stone as was ever employed in a temple.

Symmetry in Art.

There are objects which it is necessary to present to the eye perfectly symmetrical, either because they are so essentially, as a vertebrated animal (mammal, bird, reptile, fish), a radiated animal (starfish, sea-urchin), or because symmetry pleases us in the form of an object of art which is isolated, as a column, a pyramid, a triumphal arch, a temple, &c.; and it may be remarked that Gothic churches are, for the most part, constructed upon a symmetrical plan. Symmetry pleases also in a circular or elliptical border of flowers, the whole of which the eye takes in at a single glance. Finally, a symmetrical disposition should be observed in the arrangement of many objects grouped around or before a principal object, as the arrangement of such a garden as that of the Tuileries, which had a breadth equal to the façade of the palace, or the arrangement of a much vaster garden, which is co-ordinate to a palace, such as that at Versailles. When a whole is subdivided into symmetrical parts of a definite extent, it can, in many cases without injury to the whole, vary each part without going beyond the point at which discord would arise between them. This is what has been done in the park at Versailles, with a portion called *le miroir*, a charming garden when it is planted with flowers properly assorted. The principle of symmetry is valuable for obtaining a general effect from many objects analogous, but differing amongst themselves, like the varieties of one species, or congeneric species or even species of neighbouring genera belonging to the same family. If there are objects to which a symmetrical form is suited, to the exclusion of every other—if there are grounds which must be laid out symmetrically, in order to connect vegetable nature to a grand architectonic composition—there are also objects to which the symmetrical form is not so essential but that it can be dispensed with, and there are grounds which it is more suitable to lay out on the system of landscape-gardening than according to the principle of symmetry, even when it is not designed for the sake of gratifying a taste for variety. For example, whenever a mass of objects cannot be embraced at a single glance, because they occupy too much space—or when ground which is made of planes differently placed in regard to one another, and even this ground, being flat, is very irregular, and the buildings upon it are not placed as they should be, in a symmetrical composition—it is convenient to throw aside the principle, not to carry out a system of irregularity, but to attain a pleasing distribution of objects, and even to have parts which, considered in detail, will appear less irregular than they would have done as a whole, if confined to a single plane. It is in conformity with these ideas that the planting of masses in landscape-gardening has been subordinated to principles which are very distinct from those absolute ideas of irregularity which some people maintain.

Richborough Castle.

The foundation of the walls of the castrum is formed of two rows of boulders, laid upon, or a very little below, the surface of the natural soil, which is a compact pit-sand. The great body of the wall is composed of layers of boulders and layers of a mixture of boulders, sandstone, ochre-stone, blocks of chalk with pholades embedded and balani on their surface, the whole cemented with mortar formed of lime, grit, sea-shells and pounded tiles. There are also pieces of oolite and travertine, which some geologists have imagined were brought over from the Continent. These ingredients vary in proportions in different places, apparently as particular materials were abundant or otherwise during the progress of the building. It was the opinion of Mr. King that the walls were constructed by having the whole mass flung carelessly into a great caisson, or frame of wood, the interior breadth of which was that of the

wall, and its depth that of the space between the alternate rows of tiles, while its length was sometimes more and sometimes less, just as suited convenience, and that the parts thus reared, one at the end of another, on and over each row of tiles, were united together afterwards merely by means of very small loose stones and mortar thrown into the narrow space left at the ends between them. The objections to this theory are that the separations asserted to be filled up with small loose stones are nowhere discernible. The distances between the bands of tiles are not equal, as they probably would have been had caissons been used, and the materials constituting the body of the walls do not appear to have been thrown in carelessly, but, on the contrary, are arranged with much precision, as seen in the south wall, from which almost the entire facing has been removed, and towards the east side an immense mass of the interior masonry has been extracted so as to form a kind of chamber, in which the regular arrangement of the strata of boulders is clearly shown. In other places, where the walls have been broken into, the same system may not be so obvious on account of the difficult nature of the materials.

Early English Mouldings.

The exquisite skill, taste, and patient labour invariably evinced in the working of early English mouldings are truly admirable. The ingenuity that was never at a loss in any difficulty of finish or constructive irregularity, and the minuteness with which even the most concealed and darkened parts were executed, are circumstances of much interest, and show a love for the art above the sordid considerations of minimum cost. The deepest hollows are all as cleanly and perfectly cut as the most prominent and conspicuous details; and in the village church as much so as in the most glorious cathedral. An early English doorway is often a wonderful piece of art, however little it may attract the attention of ordinary observers. It is most pleasing to notice the long trails of dog-tooth lurking in the dark furrow of a label or channelled recess; to see the end of some inconvenient member got rid of by throwing a flower across the point where it suddenly stops or dies into the wall; to admire the floriated boss and the foliated capital intruding their luxuriance upon the mouldings and hollows, as if they had overgrown their original and proper limits. How beautifully, too, the knots of pierced and hanging leaves extend like some petrified garland or bower of filigree-work round the arch, dividing the plainer mouldings into groups, and almost imparting life and vegetation to the very stones. There are abundance of doorways of this style which exhibit the most delightful varieties on their forms and groupings; always, yet never, the same. Some examples occur at Bolton and Furness Abbeys, whose arch mouldings extend 5 or 6 feet in width. The west fronts of several of our cathedrals have early English doorways of amazing magnificence. The entrance doorway of the chapter-house at Lichfield is a very fine example of the moulding of this style. But almost every cathedral and every ruined abbey will supply good specimens.

The Æginetan Sculpture.

These statues offer the only illustration now extant of the armour of the heroic ages. The bodies of all the figures of this pediment, with the exception of the archer who is encased in leather armour, are uncovered. The great minuteness of execution in the details corresponds with the exactness with which Æschylus, Homer and the earlier writers of the heroic age have preserved in their descriptions. In the whole of these statues this is observable in every tie and fastening; it would appear that the whole had undergone the strictest scrutiny, as in each those parts which, from their position on the building, could not have been seen, are found equally exact; in every particular they are the same as those which are traced on the vases of the most Archaic style, where they are delineated in black on a red ground, as is seen in the Museum collection. The two female figures on the apex of the pediment are clothed, the drapery falls in thick folds around the figure, in their hands they hold the pomegranate flower, the feet are on a small plinth; they are the *Elpis* of the Greeks, the goddess of hope, so well known in museums and on coins, and their situation here is peculiarly appropriate, as presiding over an undecided combat. It does not appear that any of the figures on either pediment had any support to fix them in position but the cornice where they came in contact with it, they must all have been easily removable, and perhaps it may not be unreasonable to suppose that on particular festivals they were so disposed as to represent the actions then in celebration, to recall to the imagination of the votaries the reason for those sacrifices then offered to the god who presided over the temple; this would account why almost all the celebrated groups of antiquity which have decorated the façades of their sacred edifices, among which may be reckoned those of the Parthenon, the Sicilian Adimetum and the Ægina are so completely finished, and shows how what would otherwise seem a waste both of talent and labour was brought to account.

NOTES AND COMMENTS.

BUILDERS who undertake municipal contracts, but do not care to renounce municipal offices, will find some encouragement in a judgment which was given in the Irish Queen's Bench Division on Monday. A petition was presented against the return of a Mr. FITZGERALD as a member of the Corporation of Cork, on the ground that he was a contractor for labourers' cottages which the Corporation are erecting according to the provisions of the recent Act. That he had completed such a contract was not to be doubted, but is it a rule of law that to be once a contractor means that a man is always a contractor? The affair was another example of the easy-going way of transacting business which is peculiar to Ireland. In May, 1891, Mr. FITZGERALD entered into his contract, and guaranteed the completion of the cottages by January 1892, under a penalty of 20*l.* a week. The work was not completed until April. The bill was sent in, and including 283*l.* for extras it amounted to 836*l.* The Corporation engineer cut it down to 41*l.* Arbitration followed, but the award was not given until November. On the 18th of that month it was proposed to pay Mr. FITZGERALD 475*l.* under the award, but there was opposition, and the question of exacting penalties was raised. On November 26 Mr. FITZGERALD's election took place. His bill was paid on December 16. It was maintained that at the time of his election he had an interest in a Corporation contract, and was therefore disqualified. He may be still liable for penalties on account of the ten weeks' delay. The ground taken by the contractor's counsel was that when a contractor had completed his work and was merely in the position of a creditor he ceased to be disqualified. The judge adopted that view, and Mr. FITZGERALD can therefore enjoy his seat in the Council without any immediate apprehension of the consequences.

THERE was an exceptionally numerous gathering of members of the Birmingham Architectural Association and local architects, on Tuesday, to listen to the paper on "Terra Cotta" which was read by Mr. E. LLOYD EDWARDS, of Ruabon. A detailed description of the various processes employed in the manufacture of terra cotta was given. It was explained how the constituent parts of the clay are affected by the firing and manipulation, and that to secure a satisfactory final result careful thought as to painting and due allowance for shrinkage during firing are equally necessary with the skilful handling of the work in the various stages of manufacture. In dealing with the quality of the clay necessary to produce a good terra cotta, Mr. EDWARDS said that the Ruabon clay contained of silica 63 parts, of alumina 20 parts, of oxide of iron 6½ parts, of water 5 parts, and other constituents 5½ parts. To be strong enough to resist the heat of the kilns sufficiently to become thoroughly hard and non-porous, a clay must contain a large proportion of silica, and an ideal clay for the purpose must be strong enough, but without any excess of strength which would cause a twist in the burning. Having given some practical advice as to distinguishing differences between good and bad clay and terra cotta, and about the means to avoid delay in its manufacture, Mr. EDWARDS passed on to point out the most suitable lines upon which to base designs for terra-cotta work, and finally claimed for terra cotta that, in its comparative cost, capability of resisting the action of the atmosphere, beauty of colour and facility of manipulation, it was superior to stone, especially for buildings in large cities with smoke and acid-laden atmospheres. A long discussion followed, and, after replying to the speakers, Mr. EDWARDS, thanked the Association for the reception they had given him, and said that he hoped the members would be able to visit his works at Ruabon, when he would be able to show them all the processes of terra-cotta making in progress, and also several kindred manufactures.

THE advantages of costly steel platforms to carry the lofty buildings of Chicago are beginning to be doubted. According to the *North-Western Architect*, General W. S. SMITH has renounced the steel platform for the new public library, on which he is consulting engineer, claiming that a

slow compression of the soil under the footings follows from the gradual forcing of the water out by the great weights. As solid rock or a very hard overlying stratum is to be found at a depth of 65 feet below the surface, he proposes to dig a trench 15 feet deep, from the bottom of which he drives 50 foot piles reaching the firm stratum. Some of these have already been driven experimentally, and are found to sustain 40 tons each for a period of twenty-four hours without perceptible yielding in any way. The spacing proposed would give a much smaller area for the footings than that demanded by the steel and concrete platforms, while the unsolved question of the durability of the steel will be removed from consideration. There is also a great saving in first cost by using the piles. In New York there is to be employed a still more remarkable process for obtaining a secure foundation for the offices of the Manhattan Life Insurance Company. The building will have sixteen storeys, the soil is fine sand, lying on rock which is about 50 feet below the surface. The *American Architect* says:—It would be hazardous to put so heavy a structure on the sand, but to excavate the sand in order to carry piers down to the rock would be likely to undermine the neighbouring buildings, especially as the sand is saturated with water. This difficulty is to be overcome by sinking caissons, or cylinders of steel-plate, to the rock, so that the sand can be excavated from the inside of the cylinders without fear of affecting the neighbouring soil. In the case of the Manhattan building, however, a modification of the ordinary system is to be introduced. In order to enable the excavation inside the caissons to be carried on under water, they are made with a tight top like a diving-bell, and air is forced into them, so as to keep the exterior sand and water from entering while the workmen dig away the sand from the inside and under the edges. To remove it entirely, pipes are provided, through which it is forced by the atmospheric pressure.

It may not be known outside Scotland that there exists a benevolent fund which may be said to be entirely administered by the Royal Scottish Academy. In 1825 PETER SPALDING, of Edinburgh, made over his property to the Institution for the Encouragement of the Fine Arts in Scotland, "for creating a fund, the interest or annual proceeds whereof to be applied for ever for the support of decayed and superannuated associated artists belonging to the Institution for the Encouragement of the Fine Arts in Scotland." The Institution was originated about 1820 for the encouragement of fine arts in Scotland, the holding of annual exhibitions, the buying of pictures, &c. The functions of the directors of the Royal Institution, so far as regarded its original purposes, came to an end in 1860, when the pictures, drawings and library collected by them were deposited in the National Gallery, and the rooms previously occupied by them as a gallery given up. After that date the sole duty of the directors was the execution of the SPALDING trust. For a number of years the recipients of annuities from the trust fund were selected by the directors. About 1861 the directors thought it advisable to alter the method of selection, and to require that every application should be accompanied by a recommendation from two members of the Royal Scottish Academy. When the Royal Institution had virtually come to an end, and the number of directors had fallen to two, in 1882 they presented a petition to the Court for the appointment of a "factor" or manager for the estate. Mr. WILLIAM FORBES SKENE was appointed, and acted until his death in August. He followed the practice introduced by the directors, and, as an additional precaution, latterly submitted the names of applicants to the President and Council of the Academy, and acted on their recommendation. Since 1861, therefore, the selection of the annuitants has been virtually left to the Royal Scottish Academy. On Saturday the Academicians applied in the Scottish Courts for the appointment of Mr. W. GARSON as factor, as they considered that, under the circumstances, the selection of the annuitants should continue to be entrusted to the President and Council, and that it was to be the factor's duty to give effect to their decision. The arrangement was sanctioned. The value of the estate is about 10,000*l.*

SHOPS, MOUNT STREET, GROSVENOR SQUARE, W.

ALTHOUGH Britons have for a long period formed a nation of shopkeepers, it must be admitted that the conditions of trade are not auspicious for anyone who is eager to impart architectural qualities to a shop. It is easy to perceive in the illustration (from Messrs. BEDFORD, LEMERE & Co.'s photograph) we publish where Mr. COLLCUTT was hampered, as well as what could be done if there was less faith in the virtues of immense sheets of plate-glass and prominent signboards or fascias among London shopkeepers.

MIDDLE-CLASS FLATS, GRAHAM ROAD, HACKNEY, E.

THE illustration shows the block of flats now in course of erection from the designs of Messrs. ESSEX, NICOL & GOODMAN, architects, of London and Birmingham. They occupy a site near the Hackney Station of the North London Railway. They comprise six separate buildings, each six storeys high, with separate staircases to each, leading to suites of two, three and four rooms, the suites being so arranged that they can be converted into suites of five. Each has a kitchen with larder, sink and dust-shoot and water-closet; the wash-houses are in the roof, with drying flats adjoining. The material used in elevation is pressed red brick and stone and tile roof. The whole of the floors and staircases are of concrete, thus rendering the buildings completely fireproof. The open spaces between the various blocks will be laid out as public gardens. There will be 414 rooms in the whole block when completed.

THE CATHEDRAL, OR DOM, FRANKFORT.

POTTERY GLAZES.*

IN many cases glaze is to a pottery-designer what the canvas is to a picture-painter—the field whereon he is able to express his conceptions. But it is sometimes more than this: it is often the varnish which, while protecting his work, gives brilliancy to his colouring. Nor is this all; in many instances it is allowed to become the vehicle by means of which the design is harmonised and mellowed into a beauty of tone only possible to the painter on canvas after long years of patient waiting for time itself to effect.

Glaze may be translucent, transparent or refractive; it may be iridescent or full of the richest colouring, and it may be soft as vellum or brilliant as the diamond in its texture; in short, it is capable of producing, under the touch of a master hand, a harmony of result rich and powerful in tone as an autumn sunset or tender and delicate as the dawn of spring.

It is not necessary to occupy time by referring to the origin and development of glaze in pottery. The various stages, from the closing of the surface of a porous, sunbaked ware, with some cerate to make it water-tight, onward to the brilliant texture of true porcelain, embrace the entire range from primitive utility to the highest decorative embellishment, fascinating to the eye and exquisite to the touch.

Though the functions of a glaze are mainly to render the ware impervious and cleanly, and to impart smoothness to the surface, it must be conceded that in decorative pottery these qualities are often made to subserve the embellishment of the object. In the case of this Satsuma vase, for instance, the fine crackle adds greatly to the beauty of the result, but it undoubtedly holds the dirt and grease.

It is no part of our province at present to discuss how far such sacrifice of the useful to the æsthetic is legitimate. It will rather be attempted to show how the treatment of the glaze itself may serve to enhance the beauty of the material by employing its peculiarities to the best advantage in the decoration of the ware.

Definitions.

Two main subdivisions are at once marked out by the method of the preparation, viz. raw and fritted glazes.

A glaze may have all the materials requisite to its composition carefully ground and held in suspension by water or other vehicle, and when the needful heat is applied upon the surface of the ware these materials are fused into a vitreous glaze or enamel, as shown in these specimens of fired and unfired enamelled stoneware—such is termed a "raw" glaze. It is possible to secure satisfactory fusion by this method when the materials are insoluble, but when soluble alkaline and other

salts are added it is necessary to melt or flux the ingredients together, thus insuring ultimate vitrefaction. After grinding the resulting "frit" in water, the ware is, as before, covered with this "fritted" glaze, as shown in this example of earthenware. Moreover, the composition may be so arranged that the firing of the ware and of the glaze is accomplished at one operation, or if necessary the body may be fired before glazing. For decorative purposes these distinctions have a most important influence on the result, as will hereafter be seen.

The general term "glaze" may be broadly divided, according to texture, into five main divisions:—1, Enamels; 2, glazes; 3, smears; 4, flows; 5, salt or vaporous glazes; 6, lustres.

1. Enamels may be opaque or translucent. Covering the surface they altogether conceal or partially modify the colour of the ware beneath. This may be effected by various means:—(a) By fusion with metallic oxides, as tin or arsenic. (b) By suspension of opaque particles in a transparent glaze. (c) By semifusion of raw glaze. Examples of each of these methods are here seen.

2. Glazes.—The term "glaze" is properly confined to a transparent varnish covering the ware. It may be:—(a) Colourless; (b) stained; or (c) curdled.

3. Smear is a thin, transparent semi-glaze sublimed on the ware during firing. The inner surface of the sagger in which the object is placed in the kiln is washed with a mixture of lead, alkali or other material capable of volatilising by high temperature. Small quantities of this mixture are sublimed upon the ware, giving the delicate texture seen here. When a clay contains much soluble alkaline salt, these by evaporation of moisture are brought to the surface, and during firing often produce a "smear" upon the ware.

4. Flows are somewhat distinct from "smears," although applied similarly. Volatile salts are mixed with carbonate of lime, &c., and placed within the sagger, causing a vapour which increases the fusion of the glaze already laid upon the ware, at the same time swimming the colour, and thus imparting softness to the design as shown here.

5. Salt glaze.—Altogether distinct from the above methods is that of salt glazing, made familiar to most by the interesting examples of old Grès de Flandres and Burslem stoneware, and in modern times by the well-known productions of Messrs. Doulton, at Lambeth. The process so often described is as simple in its operation as it is complex in its chemical reaction. The ware when dry is placed without glazing in the kiln. When at the vitrifying temperature common salt is added through small holes in the roof of the kiln. The consequent vapour fills the entire interior of the kiln, attacking every portion of the surface of the ware, and forms by chemical combination an extremely hard and thin glaze. One great advantage of this method is the equality of thickness afforded by the glaze to every part exposed. In a dipped glaze, on the contrary, the hollows are often unduly filled up to the detriment of the piece.

Classification.

The classification of glazes has been attempted at different times with varying success. Brongniart gives three classes only:—

1. Varnish, or glazes fired at low heat, including those with lead and borax.

2. Enamels, or opaque glazes.

3. Cover, or glass-earth, including those which mostly fire at high temperatures equal to that of the ware itself.

Salvetat divides into seven classes, thus:—

1. Lead glaze—coarse earthenware.

2. Boracic glaze—granite ware, fine earthenware.

3. Tin glaze—Urbino ware. Della Robbia ware.

4. Silica alkali—salt glaze stoneware.

5. Earth alkali, or felspathic glaze—porcelain enamelled stoneware.

This plan of taking the composition of the glaze as the basis seems, on the whole, the most satisfactory, though it has one objection, viz. that it indicates neither texture nor density, because the proportion of the various ingredients is not taken into account, and results widely differing are therefore brought under the same heading. Each of these classes have their distinctive features, which need the attention of the ceramic decorator.

Lead glaze, for instance, is especially liable to trickle and run down the ware, and when compared with boracic glaze under the same conditions this is very evident. The latter, as shown here, keeps its position on the vase, while the lead glaze has run down. This is often the destruction of the underglaze painter's work, lines and bands being liable to slip down with the swimming and falling of the glaze. Another peculiar property of boracic and soda glaze is the power it possesses of developing the colour in turquoise enamels, and those rich *flambée* (*sang de bœuf*) effects which are so skilfully obtained in some of the old Japanese wares.

Tin enamels have a quality entirely distinct, produc-

* From a paper by Mr. Wilton P. Rix, read at a meeting of the Applied Art Section of the Society of Arts and published in the *Journal*.

characteristic effects on the design in which they are employed. The object of the opaque enamel is in most cases to obliterate the low colour of the body beneath. Hence the thickness is considerable, and, inasmuch as the fusion of the glaze is not in all cases complete, the modelling of fine details is avoided. Hence the broad effects of all the Della Robbia work. Neither do the colours allow of any strong contrasts of shadow in the hollows, as is the case with coloured glazes. The light being reflected only from the surface, there is a flatness and sameness of effect which, notwithstanding the splendid skill that has been devoted to the decoration, compels us to place it in a secondary position in the list of available materials.

For decorative purposes glazes may be broadly divided into coloured or uncoloured.

In Texture.—(1) Transparent; (2) translucent; (3) curdled; (4) opaque; (5) lustrous.

In Construction.—(1) Dead, or non-reflecting; (2) pitted, or egg-shell; (3) brilliant or vitreous; (4) bubbled; (5) cracked.

Decorative Value.

Apart from these distinctive classifications, the decorative value of glazes in ceramic design is a matter of considerable interest, and it is the object of this paper to show that the glaze itself plays a very important part in the artistic result. Beyond this, it may also be demonstrated that the relative merit of various glazes is based upon certain optical principles which have been at present only partially examined by scientists, and that these principles, which underlie the pleasurable sensations to the eye, really govern that which we are pleased to call good taste and excellence, so far as glazes are concerned, and are not mere matters of opinion.

The value or utility of a glaze for decorative purposes is affected—

1. By its colour.
2. By its fusibility.
3. By its construction.

1. Colour.—The colour of a glaze is obviously of the first importance. Here are various illustrations.

The purity of white seems to be less pleasing in the case of this vase than the ivory tone which blends more fully with the colours of the design.

Here the colour of the whole is harmoniously assisted by covering the surface with this rich, warm orange glaze, blending, with the happiest results, the tone of the design and that of the background, the contrast of which would have appeared raw and cold without it.

In this instance, again, the best possible effect has been secured for the decorator by dipping his work in a warm glaze, which, while softening the outline, has also given strength and tone to the whole.

In all these examples, the glaze has been used merely as a dip, covering the whole piece. But there are further uses of it, which have been much improved of late years, following the methods of majolica, Palissy ware, and the Grès de Flandres. In all of them coloured glazes are substituted for pigments, and pencilled over various sections of the design, which is often modelled in relief. Examples of this are to be seen here. It need hardly be pointed out that in the pencilling of glazes by this method, the details of work are greatly limited. The glaze is generally thick, thus clogging to the brush, and it becomes somewhat unmanageable.

This suggests the query if an equally pleasing result may not be obtained by pencilling pigments only, and dipping after in a transparent colourless glaze. But a moment's reflection will show that the value of the two methods is not by any means the same, and that while gaining in definition and ease of production, there is considerable loss in richness and mellow-ness of effect and of satisfaction to the eye.

In order to demonstrate this, let anyone place at the back of a plate of white transparent glass a piece of dark blue paper, and at the back of another thick plate of blue glass of the same tone and thickness a piece of white paper. In a strong light the comparison of the two will at once convince the observer that the tone and quality of colour in the latter is greatly more pleasing. Though it may not be possible to enter here into all the complex details of the amount of light absorbed, refracted, reflected, and scattered in the two cases, it is not difficult to show that what is thus apparent to the eye has its foundation in something more than an æsthetic opinion.

Fusibility.—The second, and equally important quality affecting the value of glaze, is its fusibility, which greatly affects its power of refraction. All transparent glazes should be fused to the highest degree of temperature which they will bear without trickling down the piece; and, at first sight, it would seem that, provided the glaze is smooth and clear and evenly fused over the whole surface, difference of hardness or density will be immaterial, except on the score of durability. Such, however, is by no means the case. The higher the temperature a glaze will stand, the greater the hardness; and the greater the hardness, the greater the power of refraction. The greater the

refraction the greater the brilliancy of the light reflected back to the eye, and the greater the pleasure appreciated therefrom.

Construction.—Another, and equally important consideration in the quality of a glaze is its construction or texture. This greatly affects its beauty, as upon it depends its translucence, or power of reflection.

(a) A glaze may be opaque, but it may reflect much light from its surface. Or (b) it may be translucent, reflecting scattered light which has penetrated the surface; or (c) it may be transparent, allowing the greater part of the light to pass through it to the ware itself, being reflected back to the eye from the background. (d) And, further, it may be transparent in itself, yet loaded with opaque particles which partially reflect and partially scatter the light, often with the happiest effects and the richest beauty of result. (e) In addition to all these, a glaze may have imported into it some peculiar quality from the incomplete mingling and fusion of the material, through intentionally firing to an insufficient temperature. This mostly happens with raw glazes.

Doubtless the difficulties and risks of manufacture are great, chiefly owing to the fact that it is necessary to expose the ware to the flame of the open fire. It is not therefore surprising that a process so difficult, and needing such watchful care and experience in its completion, should have been gradually abandoned in Staffordshire in favour of the easy methods of dipped glazes and sagger-burning; and it is greatly creditable to the enterprise of Sir Henry Doulton that, in the face of acknowledged obstacles, salt-glazing has again been raised to the position of a fine art, so that its productions are able to vie with and even surpass the results of every age and country.

With the most perfect fusion the surface is never quite evenly covered with glaze, the reflected image being always somewhat distorted. Even this, however, gives additional pleasure by breaking the monotony of the surface. It is only necessary to compare a piece of ware lapidary polished with a piece of ware glazed to see that the mechanical surface is much less interesting. By some designers this quality of brilliant reflection of light from the surface is considered a detriment to the ware because it is liable to interfere with the design, often entirely obliterating the effect of the work. It is quite possible to avoid this objection by adopting any of the various expedients for breaking up the reflecting surface. In this example it will be seen that the plain glazed surface of the upper portion reflects the light freely; whereas the surface of lower portion being broken up by the impression of a very fine network is entirely free from this defect, although the whole vase is evenly covered with the same thickness of glaze.

The same effect has been secured by Messrs. Maw in their "Morocco" surfaced tiles, which are made non-reflective by a similar method. This is a matter of much importance in ecclesiastical decoration. Strongly glazed tiles are open to much objection in obliterating the design by reflection. And the manipulation of enamels and glazes by dulling of the surface in painting and firing is a great gain, giving as in this panel all the effect of tempera work. On the other hand, it is equally possible for the skilful designer to lay hold of this quality of reflection and so add interest by emphasising it. Here is an instance in which the chief quality of the design depends on the high reflective power of the surface. It is only necessary to compare it with this unglazed piece of similar design to appreciate the great superiority of the former.

Doubtless all these various qualities, the subtle combination of which together constitute the beauty of any given ware, may appear to be minute and even trifling, but the very minuteness of the variations together with the complexity of the results are in themselves a source of satisfaction. The extremely sensitive organism of the human eye gives it the power to appreciate the most delicate and subtle changes of light, colour, and form, and the sense of this power, as well as the very opportunity of exercising that refinement of discrimination, is in itself a means of infinite mental enjoyment.

There is still another point which demands attention before leaving this part of the subject, viz. the scattering of light, due to the character of the background immediately underlying the glaze; a matter which, in its influence on the artistic result, is by no means unimportant. It must be evident to all that it is possible to leave the unglazed surface of the ware in a variety of conditions before covering it with glaze.

(a) It may be roughly formed without any attempt to smooth it carefully; or

(b) It may be completely burnished, so that the surface is to a great extent impervious to the glaze fusion; or

(c) The surface may be purposely formed of coarse granular particles, leaving an irregular formation on which the glaze is deposited, and into which it fuses.

The soft translucence of porcelain is greatly due to this intimate blending of the glaze and body, uniting the whole into one mass, having no sharply dividing line between the two, so that when the light penetrates the transparent glaze, it is reflected and refracted from the surfaces of the minute crystals

resulting from the combination of the clay body with felspathic flux.

In beauty of texture, the material is unsurpassed, uniting, as it does, all the highest qualities of the potter's art; an enduring evidence of the triumph of human skill and persistence in conquering the most serious obstacles which stand in the way of its successful production.

It is hardly necessary to remind the decorator that the material to be employed as well as the tools and appliances for carrying out the work must greatly modify the treatment. Especially is this remark true in respect of pottery glazes. The design which might prove admirably suited for underglaze work on bisque must be wholly unfit for painting on raw enamel; and, for many reasons, an artist is compelled to inquire before proceeding the nature of the glaze to be used for the completion of his work, unless he wishes to run the risk of hopeless disappointment in the result.

Decorative Application.

Having thus far treated of the characteristics which, for purposes of decoration, give value to a glaze, and at the same time attempted to explain some of the principles to which those peculiarities are due, I may perhaps be allowed to draw attention to a few examples of the successful application of various glazes on the embellishment of pottery.

A.—Subordinate Treatment.

In many instances the designer is naturally led to subordinate the glaze entirely to the main features of his work, using it as a means of adding brilliance to his result, or of imparting a soft translucence. A comparison of the two methods is furnished by these beautiful examples of Worcester porcelain and that of Messrs. Copeland. In the first the ivory-toned ground is made the field upon which gold enrichments have been added, the translucence greatly assisting the beauty of effect; while in the latter, brilliant transparency and purity of the glaze serves to give piquancy to the whole; or, to take another instance, it is interesting to note the same skilful subordination of glaze to its purpose in the treatment of this exquisite design by M. Solon. The soft and tender fading of the half-tones into the background is greatly enhanced by the rich glazing, which, however, does not interfere with the delicate modelling of the subject. Comparing this again with the vase here shown, designed by Flaxman, it is not difficult to apprehend the reason for the different treatment of the modelling adopted. Having no intention of glazing, the artist has trusted alone to the pleasant translucence of his material to overcome any harshness of effect. Looking at the two examples, one feels that it would be as unpardonable to add the glaze to one as to remove it from the other.

It must occur to the least initiated that the comparison of advantages in painting over or under the glaze is most important to the ceramic designer. For endurance and for softness of tone the underglaze system is undoubtedly superior; nevertheless, the palette thus becomes limited, and many otherwise available effects must therefore be discarded. Moreover, in some cases the placing of colour or gold over the glaze heightens the beauty by enabling the eye to more fully appreciate the translucence or the thickness and tone of the glaze beneath.

In this example the gilding on Doulton ware glaze gives a sense of satisfaction from the same cause. Equally pleasing is the gilding on this vase of "Crown Lambeth" ware, which also affords an illustration of a somewhat different manipulation.

The design mostly painted on the biscuit is, after glazing and firing, retouched and worked up with underglaze colour, being again glazed and fired at the same heat. The blending of the finishing colour with the glaze, in which it is thus entirely embedded, while affording some considerable risk for the decorator, gives a soft and mellow gradation of tone which can hardly fail to commend it.

Midway between the "subordinate" and what may be termed the "principal" use of glaze as a decoration, one finds a class of treatment involving the use of glaze in harmonising or mellowing the tone of the whole design by a variety of methods. The simplest of these is perhaps the adoption of a "crackle glaze," as in the well-known Satsuma ware. It is not necessary to expend time on explaining the different adjustment in shrinkage of the body and glaze which causes this. It may be sufficient to point out that, in cooling, the whole surface is broken up into a network of small cracks. The reflection of light thus obtained on the edges of the fractures acting as facets breaks up the plain surface and tends to add brilliancy as well as harmony to the whole. A good example of this effect is to be found in many of the wall-tiles produced by Mr. De Morgan.

Another expedient for the same end is to be found in the covering of the surface with a coloured glaze, giving a certain tone to the whole as previously mentioned. In the example here shown the beauty of the work is greatly enhanced by the rich green glaze in which it has been dipped.

A third method is illustrated by this piece of Lam-

beth Carrara ware. A white background is decorated in green slip, the hard contrast of the two being subdued by covering the whole with a semi-opaque glaze, which tones the colour while it emphasises the brush modelling.

B.—Principal Treatment.

Passing on to the use of the glaze itself as a principal decoration, we note many interesting and ingenious adaptations. The use of broken colour alone, combined with small crackle, affords the *motif* for the well-known and much prized tortoise-shell ware of Wedgwood, as also in the beautiful specimen of Aventurine glaze of French manufacture, resulting from the combination of iron and copper with an alkaline glaze. Also in these reproductions of the Japanese tea-jars in Doulton ware. The lustrous surface gives sufficient interest to the beautiful production of Bealek and other similar pottery, while the movement of the surface is illustrated in this specimen of the ware of Japan; and in this we have another very peculiar and striking instance of glaze treatment. The glaze, having crazed at an early stage of the firing, gradually contracts until each minute section shrinks away from its neighbour and becomes a small round drop, giving the whole the appearance of peach-stone or nutmeg surface.

A further and striking development of the same idea is here shown in another method. The glaze is first of all formed into small, glassy beads, and these are embedded in a coating of glaze dipped on the pot while the same is wet. After firing, the refraction of light gives from some points of view a very singular and brilliant result. Here, again, is an altogether different adaptation of the material instanced in these delicately skilful productions of Messrs. Minton. After finely perforating a design in the ware, the piece, when fired, is covered with a glaze sufficiently thick to fill the interstices, with the most charming and artistic result.

Almost all the above have as their basis the desire to produce satisfaction to the eye by variety and contrast through the breaking of the surface of the colour of the glaze.

A very happy and extremely delicate combination of both treatments is well illustrated by the "mother-of-pearl" background, a clever and ingenious texture lately produced on Messrs. Doulton's Burslem china. Its iridescence, although apparently similar to lustre, is altogether distinct in the method of production, as will be seen on close examination.

Altogether different from the modes already named is the filling of an intaglio design with a soft glaze. The ware is horizontally fired, and the coloured glazes flowing to a uniform level during fusion produce a shaded effect, according to the varied depth of the design. Here are very characteristic examples of this method. A similar operation, but upon a modelled surface, is here adopted.

It has been my desire, in thus limiting attention to one section only of the potter's work, to arouse at the same time in the ceramic designer a wholesome pride in his material, and a true respect for his handicraft. Nothing short of complete excellence and thorough honesty of workmanship in the potter's art can withstand the searching test of that extreme fire necessary to produce the most perfect and enduring result; and as in other spheres of life, so in this, disintegration is the ultimate penalty of all that is false and superficial and immature. Nor is it possible to avoid the conviction that, for the attainment of the highest perfection, there must be added to this honesty of purpose that absolutely harmonious co-operation of each towards the final result, which is the truest ideal of human existence.

Pottery consists of a chain of operations in which there are many links, each process in itself complex, and in its principles far from completely comprehended. Yet the failure of any single link brings disaster and dismay, wrecking the willing work of all that have gone before. Notwithstanding this, the triumphs of pottery in China, Persia and Japan are marvellous, not merely as creations of beauty, but as examples of what may be accomplished by means so primitive and methods so simple that they would seem to be within the grasp of every beginner. Yet one is humbled by the reflection that, notwithstanding all the advances of science, and all the perfection of modern mechanical appliances, added to the combined experience of a hundred generations, the achievements of these Oriental potters have baffled all the efforts of modern times to equal or surpass them.

Nevertheless, in this we find no cause for disappointment; rather let us take courage in the fact that in pottery, as in other arts, the path to success lies in the painstaking discrimination of results and the unbounded ambition to arrive at the highest standard of excellence, scorning to be satisfied with aught that falls short of the ideals we have set before us.

Sir Henry Doulton, the chairman, said this was a most interesting and valuable paper, full of information and suggestion. Even those who were not potters could appreciate the important part that glaze played in the beauty, harmony and durability of pottery. There was one popular misconception

with regard to glazing which he should like to dispel; a bright glaze, as a rule, gave no security for durability, and he did not think the potter's difficulties in this respect were sufficiently appreciated. To take a simple illustration: a common Sunderland milk-bowl with a beautiful cream-coloured glaze inside was very nice to look at, but the body on which the glaze was run was comparatively porous, and it would be seen, if any housekeeper attempted even to salt anything in that pan, that the glaze would come off; it would not require even acid to take it off. The glaze was beautiful enough, but the body itself was lacking in hardness. Sometimes these bright, beautiful, coloured pieces were hard in body as well as hard in glaze; it was that which taxed the potter's ingenuity and skill to accomplish. Mr. Rix spoke of the links there were in the potter's art; and, in fact, there were a good many, and the strength of a chain was only that of the weakest link—a proverb which all potters could thoroughly appreciate. The potter might have forged the whole chain, and then the last link failed him, and the whole work was a failure. The great merit of the paper and the originality of it was in showing the optical laws which had not previously been noted in connection with the beauty of glazes, and he felt certain that an optician following out the line of argument he had suggested, would come upon certain principles which, if attended to, would make a piece of pottery beautiful. No doubt the Orientals, by tradition and otherwise, had arrived at results which we had to arrive at by scientific methods. He might mention, as an illustration, a tile panel which he had the good fortune to possess; a Persian panel which Mr. Sparkes first directed his attention to. It had that beautiful effect of translucency in a most eminent degree, and it was borrowed by M. Purdon Clarke to place in the Indian collection at the Paris Exhibition of 1878. In the course of the exhibition he heard that Mr. Deck, the great French potter, wanted to see him, and it turned out that he wanted to purchase this panel, and though he told him he did not want to part with it, he saw him three times about it, pressed very hard, and said he would not only give a very good price for it, but would make him one which he would be hardly able to distinguish from it. One remark in the paper was with reference to the touch of pottery; and that reminded him that a gentleman who highly appreciated Wedgwood ware, Mr. Edkins, of Bristol, sitting by his side one day at Christy's, said he judged more by the touch of Wedgwood than by anything else; that he could rely on that quite as much as his eyesight. With regard to the salt-glazed ware, it might not be generally known that it was applied twenty-five years ago only to the commonest ware—to ginger-beer bottles, blacking bottles, and drain-pipes. At one time Bristol and Lambeth were the great centres of the salt-glazed pottery trade, but there was not a single salt-glazed pottery in Bristol now, and in Lambeth it was fast going out; and but for drain-pipes, and his own love of it, it might perhaps have gone out altogether. It was a most interesting glaze, utterly unlike any other. It was something like electrotyping, or, rather, was superior to it, because electrotyping was the deposit of one metal on another; whereas salt-glazing was an actual action of the vapour on the silica itself, and so the glaze was actually the body itself fused. The difficulties of it only a potter could appreciate. It was worked in an open kiln, without any sagger to cover the pieces, and with all the gases from the coal playing about them. The consequence was, that in that very beautiful little piece of Mr. Tinworth's which had been shown, which illustrated what was possible at that time, the blues were black, and for a long time they could not get a blue at all. The whole range of colours possible in salt-glazed ware were shown in the specimens exhibited. In 1750 or 1760, in Staffordshire, glazed ware of this kind had arrived at great perfection; it was fired, not in an open kiln, but in saggars with holes in them; and if anyone came across a piece of that kind at a reasonable price, he should advise him to secure it, for he did not think any more would be produced. The finest collection of it belonged to Professor Church, and it was destroyed in the fire at the Alexandra Palace. In conclusion, he would only say that science and art were not antagonistic, and Mr. Rix had in his paper shown how they should be combined.

OUR DUTY IN RESPECT OF ANCIENT BUILDINGS.*

I HAVE chosen this subject because, for some time at least, it has not been discussed in the Association, and because it seems to me appropriate at the present time. There is, from a variety of causes, a much wider interest taken than formerly in the buildings connected with the nation's past, and, as some of us at least think, the current views as to the proper treat-

ment of such buildings are not altogether wise. The subject is one on which it is natural that there should be some difference of opinion, and I submit to you the following remarks for criticism and discussion.

We need not waste time in proving, what all will admit, that we have a duty in respect of these buildings, both a filial and patriotic duty to those who have left us the buildings, and a sacred trust to fulfil for those who shall come after us; but it may be well to consider for a moment wherein the value of these old buildings consist. Clear ideas on this head will help us to just conceptions of our duty in regard to them.

From the artistic point of view they are valuable as examples of the art of a bygone age, as part of the great record of art progress and development; but many are also and specially valuable because of their own exceeding beauty. This beauty is, or may be considered, intrinsic, always possessed by them and independent of the accidents of place or time; but very little consideration will show that this quality is more likely to be present, to be present in higher degree, and to be more recognised and valued, in an old building than in a new one. It is more likely to be present, and present in higher degree, because probably the building is one of a time when the traditions of art and the orderly and natural development of artistic forms and methods were unbroken, when the artist therefore, as it were, spoke in the vernacular instead of in an acquired language and had greater ease and facility of expression. More than that, so far as there has been a conscious choice in preserving certain buildings and allowing others to pass away, or even actively effecting their removal, that choice has been exercised in the preservation of what was felt to be most worthy of preservation, so that this process of selection has acted in favour of a high standard of excellence among the buildings that remain. But the beauty that exists is more likely to be recognised and valued in an old building than in a new one. We go to it in a more receptive mood. No work of art that is worthy of the name renders up all its charms on a first acquaintance. It requires frequent and loving study, and that mere acquaintance should ripen into intimacy, before all its beauties are disclosed. Now this prolonged and loving study we are never disposed to give to a new building, however great its excellences. We never quite lose the critical attitude, we keep the point of the sharp steel between us lest we should be surprised into unqualified admiration, and if we find nothing else distasteful its very newness is repellent. You will remember how the narrator in "Maud," "spleenetic, personal, base," as he describes himself, morbidly jealous of the young lord in whom he sees a possible rival, fastens on the newness of his castle as a grievance:—

Seeing his gewgaw castle shine
New as his title, built last year,
There, amid perky larches and pine,
And over the sullen-purple moor
(Look at it) pricking a cockney ear.

With these few touches the picture is before us, and we feel that the savage young critic has some reason on his side, that this castle on account of its very newness is out of harmony with its surroundings, and that long years must pass and the perky larches and pines have grown into mighty forest trees, ere the rich stains and mellowing influences of time bring it into harmony with the purple—no longer sullen-purple—moor.

And this brings us naturally to the second element in the value of our old buildings. Besides the value which they possess on account of their beauty, they are valuable on account of their age. They are so many voices out of the past, and so clear and explicit is their speech that they almost place us alongside of the builders—"it is as if we touched their hands." As Ruskin has written:—"How cold is all history, how lifeless all imagery, compared to that which the living nation writes and the uncorrupted marble bears!—how many pages of doubtful record might we not often spare for a few stones left one upon another. . . . It is well to have not only what men have thought and felt, but what their hands have handled, and their strength wrought, and their eyes beheld, all the days of their life." And it is not difficult to realise how powerful, how widespread, and how far-reaching this influence is. What is it that marks the greatest difference between our nation and a tribe of Australian savages? Is it not that we have not only a past but a history of that past—a history imprinted on these buildings of which we speak, a history which we can touch and handle, and which we have but to lift up our eyes to read? What puts an immeasurable distance between our city and the most flourishing of colonial cities? Is it not that by those buildings in our midst we are linked to the centuries, and feel ourselves one with the past of humanity? What a difference these surroundings make in our existence, and how poor it would become if the historic past were wiped out, and our life were limited to to-day, with its work and struggle and the outlook for to-morrow. When the young Israelite asked his

* An address delivered by Mr. W. W. Robertson, president, before the Members of the Edinburgh Architectural Association, and published in the *Transactions*.

father, "What mean these stones?" his father was enjoined to rehearse in his ears the wonderful dealings of God with His people; and even so these old buildings supply to our children, no less than to ourselves, a vivid memorial of all that is most worthy of memory in our national past, and all that can incite to patriotism and noble effort in the future.

Yet surely some of our citizens had but an imperfect appreciation of this when a few years ago it was seriously proposed to remove the centre of municipal life from the Old to the New Town. For eight centuries the full tide, not merely of municipal but of national life, has flowed up and down this old street, so that myriads, from all the ends of the earth, come now to view the scenes of so much that has been great, and strange, and tragic. Yet it was proposed that the citizens themselves should turn their backs on their past, as if all these associations were nothing compared with some slight and, indeed, altogether imaginary increase of convenience.

Buildings which have remained in continuous occupation are subject to their own special dangers. The conditions of their occupation are continuously changing. What met the requirements of a few centuries ago does not meet the wants of to-day; even what was sufficient a generation ago is felt to be inadequate to present needs, and there is always a danger, unless there is a mastering sense of the value of the old work and the importance of preserving it, that it will be sacrificed piecemeal, or its integrity and interest impaired under some supposed pressure of necessity, which a higher sense of duty would discover to be less imperious than supposed, or only of the nature of conformity to a passing fashion.

Only buildings whose use has continued without material change can hope entirely to escape this danger, and few in our country occupy this unique position, a position which is well exemplified in the case of country churches in England.

In all domestic, municipal, or civil buildings, except in stationary communities, changing circumstances bring new wants, which press hardly upon the chances of unimpaired preservation. In Scotland the adoption of new ideals of worship led to serious interference with the interiors of old churches. We need go no further than St. Giles for an example. Here the division into several churches, and the construction of pews and galleries, led to destruction which we all know and deplore. When the excrescences in question came to be removed, and the extent to which the beautiful carved and moulded work had been demolished was made clear, the question might well have been asked whether total neglect and wanton injury, the ravages of faction and of the elements, could have worked more complete destruction had they reduced this building, like so many others, to the state of a mouldering ruin.

There are other perils attending continuous occupation to which we need only allude. The danger of destruction by fire should, with an awakened sense of duty, be now amply provided against, but that the danger has been real enough is shown by the fact that both the Royal Palaces of Holyrood and Linlithgow were almost totally destroyed by fire within less than 100 years. In each case the fire occurred, we must say accidentally, while the palace was in the occupation of troops quartered there by the authorities. We shudder at the catastrophe, but how very consoling it is to know that no such thing can occur at the present day, that no national buildings are now put to uses inconsistent with their ancient dignity or involving special risk of injury or destruction.

The special dangers to which ruinous buildings are exposed are sufficiently evident. There is the danger of decay and injury by the natural agencies always at work. During last century they were exposed to spoliation and wanton destruction at the hands of those who found them convenient and economical quarries for the building-stone which they required. It is to be hoped there is now no danger of wanton and deliberate destruction; but a danger special to the present century has taken its place—a danger which I do not name as yet, because I wish to carry you with me a little longer, and I fear that the mention of the fatal word will be the signal for suspicion and criticism and dissent.

We have thus far considered, in a rambling and imperfect fashion, the great value of these ancient buildings, wherein that value consists, and what are the special dangers to which they are exposed. I now come to deal more directly with our immediate subject—our duty in respect of these ancient buildings.

I say at once that I believe our duty may be summed up in the single word "preservation"—preservation under the most favourable and suitable conditions, for the longest period possible, and for the instruction and delight of the greatest number possible. This seems very simple, and I believe few would dissent from it. It is one of those general principles which we all subscribe to most harmoniously, and fall out about the application; one of those articles of faith which we admit into our creed but translate most variously, or even seem to deny altogether, in practice. How is this preservation to be secured, and under what conditions? An intelligent autocrat could do it—to his own satisfaction; a second Solomon could not hope to do it so as to avoid adverse criticism.

As there is no autocrat to appeal to, we must endeavour to influence public opinion, and therefore I say that our first duty is to obtain ourselves, and to promote among the general public, an intelligent appreciation of the merits and value of these buildings. Here we may work both individually and in association. If the individual interest is strong, it will find its opportunities; but I may remark that I think the Association's excursions and visits to old buildings are calculated to do good in every way, both to ourselves and in directing the public attention to the subject before us. This seems to me one of the most interesting and useful parts of the Association's work and one which it does well to foster.

Then I must refer to the work of illustrating these buildings, both for reference in the study, and as a record for future use if they should unfortunately disappear. The Association has done some work in this way too, but in this connection we naturally think of the great work of Messrs. MacGibbon & Ross on the "Castellated and Domestic Architecture of Scotland," recently completed, to which we all turn with so much satisfaction. We have marvelled at the industry which the work shows, labour which in the main must have found its reward in the satisfaction it bestowed, but which we should be blameworthy did we not acknowledge with thankfulness. May I also refer to the School of Applied Art, recently opened here under such favourable auspices, which, under a properly established system of bursaries and scholarships, may yet aim at a complete survey of the whole field of ancient Scottish art, and which has already achieved something in procuring casts of the beautiful carved work of Elgin Cathedral, casts which were previously not in existence.

I proceed to say that our second duty as architects in connection with these old buildings is self-effacement. I believe the completeness of this will depend upon the fulness of our appreciation of the old work. A true and loving apprehension of all that is good and valuable in the old buildings will beget a deep tenderness and humility in dealing with them. Although one thing which marks off the work of the artist from that of the not-artist is that he finds his chief reward in the satisfaction which his work brings him, this is not incompatible with the desire for more material rewards, and surely it is natural and right that an artist should desire credit and reputation from his work. But in dealing with an old building this desire for the advance of personal reputation should, in my opinion, be entirely suppressed. A sense of responsibility to the past, whose records, and to the future, whose interests are in the architect's hands, should leave no room for the desire of public applause; and if he receives it, it should awaken the fear that he has been obtruding his own personality where loyalty to the historic past forbade.

No architect now would treat an old building as the builders of Charles II.'s palace of Holyrood treated the west front of the Abbey Church, but there are many minor offences to which he may be tempted, and which only a true love and veneration for the old structure will enable him to resist. An architect in dealing with old buildings has many a delicate task and serious responsibility, but he should consider himself a trustee of the old building committed to his care, and should place its interests before those both of himself and his client. He should always be prepared to say how far the exigencies of present requirement must bow to the duty of preserving the ancient edifice, and in the last resort, when the two things have become clearly incompatible, to say whether the value of the edifice is not such as to demand the provision of the desired accommodation elsewhere, and the preservation of the building from that time forth simply as a monument of the past.

As regards buildings that are ruinous and fragmentary, I believe the architect's duty is to see that all that can be done for preservation is done—that, and no more. For both classes of buildings his great aim should be preservation: preservation in the fullest sense, and under the most favourable conditions; the removal of incongruous and dangerous surroundings, and of excrescences which stupidity and ignorance may have engrafted on the old fabric. [In this last case it is of course clear that delicate questions may arise, as to whether one of these later growths has not acquired sufficient historic significance to make good its claim to preservation even at some loss to the old structure which it obscures or defaces, and on these questions, opinions will necessarily differ greatly.]

But, some one will say, this is a most meagre programme, your zeal for old buildings is a very tame and spiritless emotion; reckon it all up, and what you suggest amounts but to this, that we are to study them ourselves, to get others to understand and value them, to do them no harm (most offensive insinuation), and to preserve them as best we can. Is not this a most lame and impotent conclusion to what has been urged as to the great value to be set on them, and the care and tenderness to be lavished on them?

I admit the charge, but I must also admit the truth and declare it, that this most meagre programme is all that is within our power to realise. I will go further, and add, it were much, indeed, if we could realise even this. How many old land-

marks, beautiful relics of bygone ages, valuable historical documents, to say nothing more of them, have been swept away within the last fifty years, which even such a modest programme as this would have preserved to us and to our children and to our children's children.

But, it will be urged, can nothing be done to atone for past neglect; can we not take each ruined fragment and, preserving it carefully, make it the nucleus of a reproduction of the structure in its pristine beauty? Can we not take these roofless and weather-worn edifices, divorced for centuries from the life of the nation, and bring them back into contact with the active life of the community? It is a pious and patriotic aspiration—alas, that we must say, it is an impossible one! impossible, or possible only by the sacrifice of all that is really valuable in the building. When you have carried out your purpose, the associations with the past may still hover around the spot, but as far as the building is concerned, it is no longer the link with the past which it formerly was.

We have come to consider the thing, and we may as well pronounce now the baneful word "restoration," which I have hesitated so long to introduce. This is the word which, like that inadvertently uttered at some magical scene of beauty and delight, may suddenly change the whole aspect of our gathering; this is the special danger to which I consider old buildings are exposed in this century, but which I delayed to name. It is, indeed, a word of evil omen, and we should have been very much richer this day if it had never been uttered, or if the ideas which it represents had never been applied to our ancient buildings. There is, we do not deny, a certain fascination about the idea of restoring a ruined and desecrated building to its former noble proportions and richness of decoration, and most people are inclined to say that if the imagination is responsible for a few details, the piety of the intention and the excellence of the general result will cover less venial transgressions. There is no doubt that this is the popular idea of a becoming and respectful treatment of our old buildings; there is also no doubt that, since the beginning of this century, so-called restorations, conducted in this spirit, have wrought more havoc and destruction among our old buildings than any other single cause, or, it may well be, than all other causes combined. If this is so, it becomes the duty of everyone who realises it to raise his voice in warning and protest, and to do all in his power against the continuance of such destruction. The importance of this must be my excuse for trying your patience further on the subject.

Does anyone doubt that this is the popular view? If such an one only knew how often, during the last ten or twelve years, I have had urged on me the desirability of restoring the Chapel Royal at Holyrood—restoring it, that is, in the sense of rebuilding all the missing parts, roofing it, glazing the windows, and introducing the internal furnishings and decorations necessary to fit it once more for use as a Chapel Royal.

This example will do as well as another to enable us to realise what restoration of this sort actually means. The condition of the building, which is, of course, only a fragment of the old Abbey Church, is shortly this:—The aisle walls and the greater part of the west wall are still in existence. The east wall is the work of the sixteenth century. The whole of the nave arcade and, of necessity, the triforium and clerestory on the north side are gone. On the south side the nave arcade and triforium remain, but in a condition unfit to bear a superincumbent load, and the clerestory on this side also is gone. But I have often been told there are sufficient remains to show what the whole must have been, and that is indeed so, except in the case of the clerestory.

We are to build anew the missing portions. To begin with, there is the whole nave arcade, triforium and clerestory on the north side. Those who are enamoured of this sort of restoration do not seem to realise that a thing once destroyed can never be restored. It is an utter and absolute impossibility. We may produce something more or less like it, but the thing itself we can never reproduce. When we have built anew this arcade and triforium and clerestory, and thus given one entire new side to the nave, do not let us suppose that we have restored the old work; it is our work, our piers and our arches, our shafts and our carving. In the "Old Curiosity Shop" the "Marchioness" assures Dick Swiveller that when she quaffed water in which orange-peel had been steeped she could fancy it was wine if she made-believe very much. But no amount of make-believe will enable us, or anyone, to suppose that these arches and piers are the old work. We know, and everyone knows, that the clerestory is our own, and mainly conjectural, and that the triforium and arcade below it are only more or less perfect copies of the old work opposite. Without doubt, as we have a genuine liking and regard for the old edifice, we have worked honestly, to the best of our ability and judgment, and the copies are really excellent copies—perfect copies we may say, or, if not absolutely perfect, they are so in our present estimation; that is enough for us to-day, and for the present we are contented if not happy in what we have done.

Well, there our new work stands, upright and handsome,

staring out of countenance the weather-beaten and rickety old work opposite. In our secret soul we have a deep and honest affection for these venerable stones, and we would fain leave them untouched. But what would you? We have begun the work of restoration and we must go on with it. The public would never endure that this beautiful new work, which is really excellent of its kind, should be confronted by these scarred and blackened and anything but perpendicular piers on the south side. The least that public opinion demands is that they be scraped and scrubbed and freed from the dirt of centuries, and brought into something like congruity with our handsome new work, and if this be done their lack of perpendicularity may perhaps be forgiven. Let us hasten to make a compact with the demon of restoration. In order to preserve these stones where the old builders placed them let us give up their surface to be cleaned and scraped as the restorer will. Alas! we have to build a clerestory and support a roof on these anything but vertical piers, and the laws of statics, which have no veneration for these old stones, or for anything else in particular, declare that it cannot be done. We must now, as has indeed been seriously proposed to me in cold blood, take down this southern triforium and nave arcade and rebuild them so that we may have a safe substructure on which to erect our new clerestory and roof: a dreadful task for anyone who has the love of the old building at his heart. Now we begin to realise the grim truth which Ruskin has declared, that "the true meaning of restoration is destruction, the most total destruction that a building can suffer, a destruction out of which no remnants can be gathered," and that "more has been gleaned out of desolated Nineveh than out of rebuilt Milan."

I do not propose to carry our restoration of Holyrood Chapel further. I do not need to show how in this and in similar attempts to prepare a long-ruined building for occupation, even where entire rebuilding is not required, there is continual necessity for renewals which, in the aggregate, cannot fail to impair most seriously the genuineness of the fabric. We need but mention the weather-worn tracery, which needs renewal before it can be glazed; the jambs and lintels, which must be rebuilt, if not entirely renewed, before doors can be fitted to them; the parapets and wall heads, which must be rebuilt before they can be trusted with a roof or have the gutters fairly fitted to them. These and similar points will occur to us all.

But it may be urged that we have taken an extreme case, that we have taken a building the greater part of which has disappeared, and set ourselves the easy task of showing that if this is restored the result is a practically new building, possessing little of the interest which pertained to the old ruin. It may be suggested that we should take the case of a building with all its main features still intact, with much of its detail in good preservation, but in which, here and there, owing to what we may call local and accidental causes, portions have suffered decay or been destroyed; and it may be asked, is it any injury to the building, is it not indeed in every way desirable, to have these portions restored in harmony with the bulk of the old work which surrounds them?

In answer to this question let me present to you a parable. Within the last few days I have made a pilgrimage to the General Register House to look again upon a document which, since first I saw it, has kept hold most powerfully of my imagination. It is the letter sent from Arbroath on April 6, 1320, by the Scottish barons to Pope John XXII., to remonstrate against his favouring the English aggressions.

In two parts this manuscript is defective. Owing, it is believed, to the excessive dryness of the atmosphere in which it was kept for some time, two patches have within a comparatively recent period crumbled into dust. There would be no difficulty in restoring those portions in the sense in which we are now using the word "restore." The very words which are wanting are known, and there is skill available which could insert fragments in the old parchment, and write on it in the old character, and, in fact, so completely reproduce the old manuscript that not one in a hundred of the ordinary onlookers could distinguish between the old and the new. But this is not done; the precious document is simply mounted on a sheet of parchment for preservation, and carefully kept, as it is, for transmission to the generations yet to come.

I am sure we feel that any tampering with the manuscript would detract from, and not add to, its interest and value; but why do we hesitate to apply the same principle to our ancient buildings, which are in the truest sense historical documents, whose genuineness is of the first importance, and, once destroyed, can never be restored. You will remember we considered that the value of these ancient buildings consists in their intrinsic beauty, in their being examples of the art of a bygone time, but in a special manner, also in their age. On this very point of age a writer whom we have already quoted says:—"The greatest glory of a building is . . . in its Age, and in that deep sense of voicefulness, of stern watching, of mysterious sympathy—nay, even of approval or condemnation—which we feel in walls that have long been washed by the

passing waves of humanity. . . . It is in that golden strain of time that we are to look for the real light, and colour, and preciousness of architecture; and it is not until a building has assumed this character, till it has been entrusted with the fame, and hallowed by the deeds of men, till its walls have been witnesses of suffering, and its pillars rise out of the shadows of death, that its existence, more lasting as it is than that of the natural objects of the world around it, can be gifted with even so much as these possess, of language and life."

Now every interference with the integrity of a building lessens these qualities. The new work must either insult the old by a parody—as we so readily admit the work of the elder restorers to have done—or it must confuse and discredit it by closer imitations, where the more skilful the imitation, the more difficult is the task of discriminating between the old and the new, and the more discredit is cast on the whole as a monument of the past.

I assert, with the utmost confidence, that the history of past restoration is the most thorough condemnation of the whole process which goes by that name. From such complete destruction as that of the exterior of St. Giles, down through all the grades of lesser enormity, we find it the most fruitful cause of loss and injury and ruin to all the buildings it touches. I do not believe there is a single building restored during the first fifty or sixty years of this century which would not call forth an almost unanimous verdict to the effect that it had suffered great and irreparable injury in the process. In the very best the work has falsified an historical document, and taken the life and interest out of the edifice.

But, it may be said, you stop at fifty or sixty years of this century—what about the last thirty years? Ah! you tacitly admit that during that period the true art of restoration has been better understood, and that it is no longer the baneful thing you would represent!

I have omitted that period from what I have just said because we are not yet sufficiently removed from it to form an unbiassed or unanimous opinion of it: we still see the work of that period from practically the same standpoint as the men who executed it; our atmosphere of thought and taste is the same, and our preferences and dislikes are mainly the same. It were idle to deny that in our knowledge of the old work and in our ability to work in harmony with it we have advanced greatly from the standpoint of two generations ago. I see men of great skill and undoubted love for the old buildings engaged in the work of restoration—men like Scott and Street, and contemporaries of our own whom I could name, and I do not take it upon me to sit in judgment on their work. None the less do I condemn the principle of the work; and I am sure of this, that if we do not condemn their work, our children will condemn it. That which hath been is that which shall be. It flatters our vanity to think that we have learned all that there is to learn of ancient art, that we have felt its inner pulses and listened to its divine message, and that those who come after us will recognise this as fully as we do ourselves. But the restorers of sixty years ago, whose work we so unhesitatingly condemn, went about their restorations with as light a heart, and with the same delightful confidence in their own insight and perfect fitness to handle the old buildings; they received the same meed of applause from their contemporaries; and I believe that as we condemn and lament their restorations, so will the generations after us condemn and lament ours. Might not a prophet arise now and say to us, "Ye build the tombs of the prophets, and garnish the sepulchres of the righteous, and say, if we had been in the days of our fathers, we would not have been partakers with them in the blood of the prophets. . . . ye be witnesses unto yourselves that ye are the children of them that killed the prophets. Fill ye up the measure of your fathers?"

But I ask, where do you go even now with your sketch-books? Is it to the buildings which have been swept and garnished and made seemly and reputable by the hands of the restorer, or to those scarred and weatherworn remains where you have yet the very work of the old masters—"what their hands handled, and their strength wrought, and their eyes beheld"? And when you pass by some building which has lost all living interest to you through the mistaken kindness of the restorer, do you not find a response in your own heart to the pathetic words of Ruskin in his preface to the 1880 edition of "The Seven Lamps of Architecture"? What he says is: "I never intended to have republished this book, which has become the most useless I ever wrote; the buildings it describes with so much delight being now either knocked down, or scraped and patched up into smugness and smoothness more tragic than uttermost ruin."

I plead, therefore, most earnestly for the careful preservation of our old buildings, and, above all, for their preservation from "restoration."

I maintain that restoration is only admissible where there is no possibility of its involving destruction, and that this condition can only be assured where there is nothing to destroy. I consider that the reproduction of our old market-cross was a

legitimate restoration and a most graceful act, but to those who still urge upon me the restoration of Holyrood Chapel I would say: My kind and well-intentioned friends, here is a vacant piece of ground, and here be masons and stones and mortar. Set ye to work and make the very best reproduction of Holyrood Chapel of which you are capable: so shall your desires be gratified and so doubtless shall a thing of beauty arise to gladden the eyes of men: and so also shall these venerable stones, which have survived the decay of seven centuries, the evil entreaty of invaders, the neglect and cupidity of their own sons, the shock of faction and of civil strife, the ignorance and stupidity of unworthy custodiers, and the rain and frost and lightnings of heaven, still remain for many years to tell their story to the generations following us.

I plead for preservation—for watchful and affectionate preservation. Suffer one more quotation from Ruskin, which most admirably, as I think, sets forth what can thus be done:—"A few sheets of lead put in time upon a roof, a few dead leaves and sticks swept in time out of a water-course, will save both roof and walls from ruin. Watch an old building with an anxious care; guard it as best you may, and at any cost, from every influence of dilapidation. Count its stones as you would jewels of a crown; set watches about it as at the gates of a besieged city; bind it together with iron where it loosens; stay it with timber where it declines; do no care about unsightliness of the aid; better a crutch than a lost limb; and do this tenderly and reverently and continually, and many a generation will still be born and pass away beneath its shadow. Its evil day must come at last; but let it come declaredly and openly, and let no dishonouring and false substitute deprive it of the funeral offices of memory."

In conclusion I plead once more, and on this we shall all agree, for an earnest and loving study of these old buildings; so shall the heart oftentimes redress the errors of the judgment. Like all proverbs, the saying that love is blind expresses but a half truth, and it has no application here. Love bestows a keenness of vision which nothing else can give, and we shall be least likely to misread the lessons of the past, or to mistake our course in the present, if it can be said of us—

Thy saints take pleasure in her stones,
Her very dust is dear to them.

LEEDS ARCHITECTURAL SOCIETY.

ON Monday evening a meeting was held at the Law Institute, Albion Place, Leeds, when Mr. H. V. Lancaster, A.R.I.B.A., gave a lecture entitled "Some Remarks on Colour Decoration." Mr. G. B. Bulmer presided. The lecturer gave a brief historical review of the principles of colouring observed in the decorative art of Egypt, Assyria, Greece, Rome, and of the later Venetian and Florentine schools; and then proceeded to deal with the decorative work of our own times, pleading for the adoption of a system of crafts rather than of trades, and so obtaining a more intimate association between the work of the architect and of the craftsman. A feature of English decoration, he said, was that it produced a "closed-in" effect, whilst the Italians, with their love of outdoor life, had always avoided such a sensation in their decorative work. He discussed under different heads the various means adopted in this country to produce our decorative effects, their history and possibilities. The architect, he said, to begin with, must at least have a thorough grasp of the *tout ensemble* of the effects which he was producing; and the craftsman should be imbued with a sense of the character of the work in which he was taking part, so that it would become artistically impossible for him to materially err in his treatment. The spirit of modern commercialism, however, had dictated that buildings should be decorated under totally different conditions; and a man of the greatest skill would find it difficult to co-ordinate his work when, perhaps, a hundred miles away from it, and with only the haziest notion of the structure he was dealing with. The architect should get thorough control over his work, drawing as much as possible with his own hand. Of course, it was not to be expected that he should have the same command of resources as the painter or sculptor, but he could bring their feeling into touch with his own by means of sketches, and thus secure that their technical skill should be used in a direction which would enhance the total effect. One could imagine that where an architect had the opportunity of training a body of craftsmen under his own eye, and of working with them for a protracted period, mutual interpenetration of ideas was most likely to be arrived at. And, where possible, this was the most desirable system to put into operation. But in the present hurry-scurry days the architect was expected to push everything through at the greatest possible speed, making use of all the facilities which the tradesman placed at his disposal. This meant the subdividing of work to such an extent that it was impossible to get into personal touch with all those engaged in it, and the architect must either indicate precisely

his intention or lose considerably in the translation of his ideas. In the first case, it was obvious that he must be content with a limited field of action, and in the second, with an approximation only to the character of the work his individual taste dictated, whereas by the gathering together of the group of workers one got the fullest power available. The lecturer described the various materials employed in decorative work, and their colour and characteristics. A hearty vote of thanks was accorded to Mr. Lanchester.

MANCHESTER ACADEMY OF FINE ARTS.

THE annual meeting of members of the Manchester Academy was held on Monday. Mr. Clarence White presided. The report stated that after the resignation and decease of the president, the late Mr. Robert Crozier, a period of twelve months elapsed without the appointment of a successor in the presidency, and at the last annual meeting Mr. Henry Clarence White was unanimously elected president. At the same meeting Mr. W. Percy was elected an honorary member of the Academy. The ballot upon the several applications for Associateship did not result in any addition to the list of Associates, nor did the subsequent ballot for membership increase the list of members. One member and two associates—Mr. Yates Carrington and Messrs. John Taylor and Chris. Blacklock—had died during the past year. The number of members therefore was 44, honorary 12, and associates 32. There were also 32 students for the current session, 21 ladies and 11 gentlemen. At the close of the life classes last session the Council examined the works submitted, but declined to award any free studentships. During the current session the life classes had been efficiently maintained, notwithstanding the multiplicity of exhibitions and the large increase in the number of claimants for popular approval. Being desirous of raising the position of the Academy and extending its influence, the President and Council had initiated a scheme for the formation of a body of annual subscribers to the funds of the Academy. They believed that this would eventually place the Academy more in accordance with its aims and needs. The movement, in the judgment of the Council, would be successful and would place the Academy in a position which would enable it to exercise a greater influence on the art culture of the district, and become an institution alike honourable to and honoured by the manufacturing metropolis of England. The treasurer's statement showed expenditure on the exhibition account 533*l.*, leaving an adverse balance of 10*l.* The revenue account showed receipts 226*l.*, and a favourable balance of about 70*l.* On the motion of the President, the report and balance-sheet were adopted. The President stated that twenty-six annual subscribers had already been secured, and that they included some of the best names in the country. This was a very good augury for the success of the movement. All the officers were re-elected as follows:—President, Mr. Clarence White; vice-president, Mr. Reginald Barber; honorary secretary, Mr. W. Robinson; literary secretary, Mr. Bruce Wallace; treasurer, Mr. W. Artinghall. The following were elected members of the Council:—Mr. H. Johnson, Mr. H. Hague, Mr. J. H. Davies, Miss Dacre and Mr. Byron Cooper.

THE SURVEYORS' INSTITUTION.

AT the meeting of this Society on the 20th inst., Mr. G. M. Freeman read a paper on "The Arbitration Act, 1889." He described the Act as of great practical importance to two classes of professional men, lawyers and surveyors. It had worked considerable changes both in the procedure and results of arbitration. Nevertheless, its scope seemed to be imperfectly understood. Had its real meaning and machinery been grasped, he did not think surveyors would have heard so much as they had lately heard as to the delay and expense of arbitration, nor did he think that curious creation of the City brain, the Commercial Court of Arbitration, would have been devised. The aim and end of the Act was to make arbitrations speedy, final and economical, and since it had become law, if any man was harassed by delay or vexed by undue cost in arbitrating his differences it was entirely his own fault. The Act dealt with two classes of reference, compulsory and voluntary. The submission of the latter to arbitration embraced all those cases where, in order to avoid the law's delays, men might agree to refer their disputes to some third person in whom they had confidence, and that was the part of the Act which mainly concerned surveyors from a practical point of view. One of the great objects of the Act was to prevent improper delay, and summary methods were introduced for upsetting any dilatory tactics on behalf of either party. Under its provisions, arbitrations had been conducted with smoothness, terminated with alacrity, and paid for with the minimum amount of grumbling.

Launceston Priory.

SIR,—With reference to the interesting proposal in your columns as to Launceston Priory, I should like to state for the benefit of Cornish and local antiquaries that a MS. in Lambeth Palace Library, No. 719, contains several charters, grants, declarations, &c., relating to this Priory. There is one which relates to the repair of the chancel and several "compositions" between the bishops of Exeter and some of our kings as to lands monastic and otherwise in Cornwall. Most of the documents appear to be careful transcripts from the originals, and the volume has the additional interest of the signature on the parchment page of the first Prior of Launceston; the rest of the book is written on paper. If any historical account of Launceston Priory is contemplated in connection with the preservation of what remains of the building, reference should be made to this valuable MS., portions of which were incorporated in Sir John Maclean's excellent "History of Trigg Minor" in Cornwall. The scheme of conservation so ably advocated in your last number will, I trust, meet with its well-deserved success by all antiquaries, both in the West of England and elsewhere, and by Cornish residents in London.—Yours faithfully,

S. W. KERSHAW, F.S.A.

Lambeth Palace Library :
February 22.

GENERAL.

Mr. E. Burne-Jones has resigned the Associateship of the Royal Academy.

The Spring Exhibition in the Leeds City Art Gallery was opened to the public on Tuesday, and was well patronised, despite the unfavourable nature of the weather.

Mr. James Reid, president of the Glasgow Institute of the Fine Arts, has been unanimously elected honorary president of the Scottish Artists' Benevolent Association.

The Society of Painter-Etchers will open the annual exhibition at the rooms of the Water-Colour Society on Monday.

The Erection of the Barracks for the Medway Steam Reserve at Chatham was commenced on Wednesday. The outlay will be about 60,000*l.*

Mr. George Clarkson, late of 341 Holloway Road and 38 Great James Street, Bedford Row, surveyor, who died on November 1, has left property worth 140,000*l.*

A Committee of the Leeds Corporation have recommended the construction of five swimming-baths in the city at a cost of 8,000*l.* each, exclusive of sites.

The Town Council of Louth will elect a borough surveyor in the course of next month.

Dr. R. Rowand Anderson, at the meeting of the Edinburgh Architectural Association on Thursday, opened a discussion on the paper, "Our Duty in Respect of Ancient Buildings," by the President, of which a report appears on another page.

A Site has been secured for the Keighley and Bingley Joint Hospital.

Mr. Heber Rimmer, Soane medallist, will read a paper on "Renaissance Architecture of Spain" at the meeting of the Liverpool Architectural Society on Monday, the 27th, which will be illustrated by sketches and photographs taken during his recent tour.

A Special Meeting of the new infirmary committee was held on Saturday, at Southport, to consider what action should be taken with regard to the plans of the new infirmary. The plans by Mr. C. S. Ingham, of Southport and Manchester, were accepted, and it was intended that the cost of the building should not exceed 13,000*l.*, but the lowest tender for the work amounts to 24,000*l.*, the highest being about 28,000*l.* The committee were unable to arrive at a decision.

Major-General Sir R. Murdoch Smith, director of the Museum of Science and Art in Edinburgh, on Tuesday evening delivered a lecture on "Persian Art in relation to Persian Life and Character" before the Edinburgh Philosophical Institution.

An Anonymous Donor has offered to meet the cost of entirely restoring the parish church, St. Mary's, Kidderminster.

The "Art Journal" for March will be an unusually strong number. In it will begin the series of articles on Mr. Henry Tate's pictures recently offered to the nation, and the chief illustration is an etching of Millais's picture, *The Vale of Rest*, besides other engravings. This picture has never before appeared in black and white.

The Architect.

THE WEEK.

It is to be regretted that the decision which was given by Mr. Justice NORTH on Tuesday, in *TYNDALL and Others v. CASTLE*, cannot be made a general rule instead of applying merely to a special case, for it would prevent many injuries to their neighbour's property by people who believe that they can do what they like with their own land. In the case in question, which related to the Camden Park Estate, Tunbridge Wells, there was enough to show that when the three plaintiffs purchased plots, they had reason to believe that a certain character possessed by the estate was to be retained. The conditions of sale enjoined that the houses to be erected should not cost less than 1,200*l.* each, and the land was not to be turned to account for business purposes. Certain stables that were allowed had to be screened by trees and shrubs. After the conditions had been observed for over thirty years, the defendant bought a part of the estate, and sublet it for a market garden; he also cut down the screen of trees, and erected cottages on the site of a lodge. One of these acts was considered by Mr. Justice NORTH as a departure from the covenants, but the others he held affected the plaintiffs, who were entitled to the benefit which arises when an estate is laid out as residential. Injunctions were, therefore, granted to restrain the defendant from using his property in such a way as would diminish the amenity of the plaintiffs' properties.

AN ecclesiastical broil which has disturbed Lourdes, and which is likely to furnish a chapter in M. ZOLA's forthcoming romance, has been settled. The village possesses no less than three churches which are erected at different elevations. One was constructed by the Abbé PEYRAMALE after the events which imparted interest to Lourdes. The bishop of the diocese entrusted the direction of the place, which was the goal of pilgrimages, to special priests, who took possession of the new building. Then the Abbé, who to some extent was deprived of his influence, undertook the erection of a new church which was to serve instead of the tottering parish church. After a time the collection of funds for the work was interdicted, and the Abbé was compelled to dismiss the workmen. After his death the relatives of the Abbé decided to set up his tomb in the incomplete building, as a protest against the action of the bishop and his clergy. The successor of the Abbé, the official parish priest, appears to have been declared liable for the cost of the work already executed, which is 600,000 francs, and, to escape the penalties, the church has had to be left unfinished as if it were nobody's property. Meanwhile, the third church, which is the original parish church, remains a ruin. The priests who have charge of the church which the Abbé PEYRAMALE was able to complete, and who are now dominant in the place, offered to restore the old parish church or to complete the Abbé's second church out of the gifts of pilgrims, but it was on the understanding that the architect and builder should renounce the claim to the 600,000 francs. It is needless to say that proposal was not accepted, and they must be infatuated pilgrims who could believe that it is a holy or wholesome act for any religionists to evade the payment of a just debt. Fortunately for the credit of the place, an unexpected benefactor has turned up. A Dutchman who, like many visitors, was dissatisfied with the imbroglio, has, it is said, offered three millions of francs to the bishop of the diocese to complete the church. It is to be hoped the first use that will be made of the money will be to pay the debts for the work which has been executed.

THERE can be little doubt that the sanitary condition of many among the London Board schools is worse than may appear from the formal reports of the officers. When we find the Assistant Architect for Repairs saying, "I am of opinion, from my knowledge of the buildings, that when the drains are interfered with and exposed a great deal more work will have to be carried out than the reports imply, and the clerks of works' estimates will in many cases be exceeded, because where defective drains are seen to

exist the local authorities will compel their renewal," it is not difficult to imagine that concealed dangers exist which are not to be removed without much cost. The Works Committee have agreed that quantities be not taken out for the drainage works, which is also an indication of the difficulty of the work. Additional clerks of works and draughtsmen have to be employed, and the Works Committee ask to be authorised to employ in the worst of the drainage cases one or more sanitary engineers to superintend the carrying out of the necessary and costly works. It is no doubt hard that the existing Board should have to bear the responsibility for defects that are appalling, but as long as they appear disposed to screen the culprits they must accept the consequences.

THE Bill introduced by Mr. BIDDULPH MARTIN, Dr. CAMERON, Dr. FARQUHARSON, &c. proposes to secure the sanitary registration of dwelling-houses, schools, colleges, hospitals, asylums, workhouses, factories, workshops, hotels, lodging-houses and other buildings. Local authorities are to become the sanitary registration authorities. Each of them shall appoint the clerk or some other person as sanitary registrar. Previous to June 1, 1894, notices are to be sent to the owners, lessees, sublessees and occupiers, demanding that all buildings in the districts are examined, and certificates of the condition signed and sealed by a licentiate in sanitary practice. After January 1, 1896, certificates are to be furnished for all new buildings. The licentiates are to be members of the Royal Institute of British Architects, the Institution of Civil Engineers, the Association of Municipal and Sanitary Engineers and Surveyors, the Surveyors' Institute, or (2) architects and engineers who have been in practice five years at the passing of the Act; (3) members of sanitary associations; (4) medical practitioners registered as qualified in sanitary science; (5) medical officers of health; (6) engineers and surveyors under the Public Health Acts; and (7) persons who have been declared qualified to design and carry out constructive sanitary works. The last class will have to pay a fee not exceeding five guineas for a license, the other classes can obtain licenses free of charge. The various bodies mentioned can hold examinations and grant certificates of competency at a charge not exceeding three guineas. In every building the sanitary arrangements must comprise a flushing service for each closet, ventilated soil-pipes, traps, air-chambers, &c. After January 1, 1895, buildings are not to be used unless they are certificated. The penalty for giving a false certificate may be 10*l.* or under, and a similar penalty may be imposed for letting or occupying an uncertified building. After five years the certificates will require renewal.

It is generally supposed that Americans are sensitive to the absence of antiquity in their country, and that is supposed to be one of the reasons for the attractiveness of England with them. We regret to find, however, that they are not sufficiently reverential about the examples which, if not of hoar antiquity, are at least surrounded by many delightful associations. According to *Architecture and Building*, just now "Elmwood," the home of LOWELL, the American poet and writer, whose life and work will ever occupy a prominent place in American literature, is in danger of destruction. His home bears upon it the legend, "To let for house lots." There are some people in the old Commonwealth who are reluctant to give this property over to the spoiler, and a formal organisation is likely to be created for its preservation. There are many reasons, not only from a literary but an historical standpoint, why this structure should not be swept away by the advance of "modern progress." From an architectural point of view it should be kept as an example of the best colonial architecture. It and the old Craigie House, LONGFELLOW's home, are of Revolutionary fame, and were centres of the best colonial social life. This house was the home of old ELBRIDGE GERRY, Governor of Massachusetts. Here he was visited by 4,000 citizens of Boston when he had incurred their displeasure. If Americans allow the iconoclastic spirit of the speculative builder to pursue its course unchecked, they will soon be a nation without "heirlooms."

RENAISSANCE ARCHITECTURE IN ENGLAND.*

WHEN the American traveller said that England resembled the Soane Museum because it was so well packed with good things, he was speaking truth to an extent that a stranger could not realise. Whatever demands are made on the treasures of the country they can be met. Annual exhibitions of old masters have not exhausted the masterpieces of painting. The loan collections can offer surprises to the most knowing of connoisseurs. There are few districts in the provinces from which an energetic committee could not provide materials to set up an exhibition, no matter how various may be the sections. It was lately announced that the Roman Catholics propose to organise one which will be restricted to objects having more or less relation to the practices of their religion, and it may be safely assumed that in spite of all that was done in penal days to destroy the aids to any devotion that was illegal and to punish the men and women who employed them, a supply is sure to be forthcoming that will be sufficient to fill several galleries. It would be no less easy to exemplify other forms of belief by the aid of English hoards, and indeed all classes of literature, all arts, all employments connected with peace and war can be illustrated out of the collections in English houses. If we were cut off from communication with the rest of the world our exhibitions would not on that account cease to be interesting; artists, archaeologists and amateurs would have no reason to despair.

England possesses so much Renaissance architecture that the contemplated number of plates in the work of Messrs. GOTCH and BROWN is insufficient to hold the more prominent examples, and when it is completed there will be sixteen additional plates. Who knows whether the authors may not be tempted to enrich the world with another work on the subject? Numerous as are the plates, they do not comprise all that remains to testify to the strength of the Renaissance spirit as shown in work which has survived the whims of fashion and the mutability of fortune. But whatever may be attempted hereafter, the buildings which have been presented are all most interesting, and the fifth part is in no way inferior in the quality of the contents to those which have preceded it. The subjects are, as before, mainly secular, viz. Conover Hall, Moreton Corbet, Tixall Gateway, Aston Hall, Brereton Hall, St. John's Church, Leeds; Fountains Hall, Burton Agnes Hall, Gilling Castle, Temple Hall, Wakehurst Place, Cobham Hall, Hatfield House. Every one of the buildings is worth an essay, but we must restrict ourselves to a few very short observations on them.

The entrance front of Conover Hall, in Shropshire, shows a large mansion with projecting wings (having windows on the returns) and a projecting porch. There is an avoidance of any feature that would appear pretentious. With the exception of the semicircular head to the wide hospitable door, and a few small circular sunk panels in the gables and elsewhere, it may be said that only straight lines are used. The band of ornament in the frieze on the ground storey is not continuous, being confined to the parts over windows. We must, however, believe that the designer was an artist and knew the value of moderation.

CAMDEN, writing in 1607 of Moreton Corbet, describes it as "a castle of the CORBETS, where, within the memory of man, ROBERT CORBET, to gratify his curiosity in architecture, began a noble building, much more large and splendid than the former, but death countermanding his designs took him off, and so his project was left unfinished." The house is in ruin. If the design came from an amateur, it must be allowed he knew the value of shadows. Instead of flat pilasters almost complete columns are attached to the walls, Tuscan on the ground storey with Ionic above, and they are contrasted on the front with a moulded projection of about the same depth as the columns, and surmounted by a sort of twisted Elizabeth ornament that might be called a half-cap. The text says, "the mixture of corbel and foliage at either side of the head of the main window is an ill-contrived finish to the mouldings from which they spring," but the arrangement

has the effect of compelling the spectator to take in both sides in his view, and to regard the window as a whole. A complete Classic or other capital at each side would have more correspondence with precedents, but is it absolutely necessary for a symmetrical arrangement that each half must be complete and independent? On the sides of the door very small flat caryatids were used, but at some of the angles animals or heraldic supporters were introduced under the columns. They are like some of the literary innovations of the age, more ingenious than reasonable. The Gatehouse at Tixall, in Staffordshire, might have been designed as Moreton Corbet, and it was wise to bring the two together. The angles are treated as turrets, and so enhanced the effect of the more ancient mansion to which the structure was the approach. There are two storeys above the entrance, and, as is pointed out, "the triglyphs under the bay windows are curved outwards and made to do duty as corbels." The windows are flanked by coupled columns arranged on the regulation principle, supporting Tuscan, Ionic and Corinthian.

The people of Birmingham may well be proud of the possession of so important an example of a Jacobean mansion as is Aston Hall. Seventeen years (1618-35) were required to complete the building; but the HOLT family took possession of it in 1631, and the authors of the book have, we supposed, lost faith in penalties, for they believe the HOLTS adopted "the only method by which it seems that workmen can be expelled from a new house, namely, by the family going to live there before it is finished and contesting the rooms inch by inch." There is little doubt the designer was JOHN THORPE, but his plan was not exactly adhered to in construction. The building is one of the best known of its class, and the skilful arrangement of the parts must strike all visitors. It is pointed out that the detail and disposition reveal a late feeling, and that a feature which was common is happily preserved, viz. the open court, with the walls projecting from the wings and the lodges at the ends.

It is supposed that Queen ELIZABETH laid the first stone of Brereton Hall, in Cheshire. The building suggests a sort of compromise between aspirations after comfort and the display that was allowable in the head of an ancient family. The central part, by means of its double series of armorial bearings and its turrets, which are made more emphatic through their connection by means of an arch, has a sort of feudal character; the rest of the hall is simply treated.

The Tudor Reformers started under circumstances which later creators of religions must have envied. By taking possession of churches and cathedrals they were saved expense and trouble. Their sense of fitness was not disturbed by the incongruity of employing buildings for a ritual for which they were not intended. There is no doubt that one of the consequences was the creation of false principles in church architecture, which were not without baleful influence on secular architecture. JOHN HARRISON, the merchant who built the church of St. John, in Leeds, about 1633, therefore merits most grateful remembrance for being one of the first who did not believe in second-hand churches. It shows, however, the degradation which followed on the penurious policy of the Reformers when we find that the architect was unable to seize his opportunity and build a church in which there would be correspondence between it and the services. It "follows Mediæval precedent in its main lines, though the detail is Jacobean." The devious policy of the time is suggested by the fact that, although built for a Protestant ritual, yet, as the authors record, "Protestantism was not to be carried too far, for the preacher of the sermon in the afternoon of the day of consecration, one Mr. TODD, the first incumbent, was promptly suspended by the Archbishop for Calvinistic teaching." It is not altogether satisfactory that when one recalls the church it is always the screen which first comes before the mental vision. It is undoubtedly a remarkable example of its class, and it does much towards making the church attractive for those who are in search of the picturesque. But what was the motive which originated it? Unless to secure a select chapel for one class of worshippers, it has no apparent use. We believe Mr. NORMAN SHAW was associated with the restoration of St. John's, although his name does not appear in the text.

* *Architecture of the Renaissance in England.* By J. Alfred Gotch and W. Talbot Brown. Part V. (B. T. Batsford)

For Fountains Hall, which comes next, what would be called an eligible site was selected, for "it is situated on so abrupt a slope that the first floor at the front becomes the ground floor at the back." It is not a fascinating example. Statues were employed to increase the importance of the house, but the figures are out of scale, and are mere journeymen's work.

The authors have assigned four plates to Burton Agnes, and they are not too much for the example. The house was built at the beginning of the seventeenth century, and brick was employed in preference to stone for the walls. The hall is in the centre of the building, but the entrance is at the side of a projection, and a similar projection is employed for the sake of uniformity. The central part is therefore on two planes, beyond which extend the wings with bay windows. The dressings are of stone. The state bedroom is elaborately panelled but the commonplace modern grate detracts from the effect. The quantity of timber used in the staircase would scare a surveyor. It is ingeniously arranged so as to afford, as it were, a number of vistas, and the greater part shows ornament in relief. There is a gatehouse, on the front of which the Royal Arms appears on a large scale.

Middle Temple Hall is always a welcome subject for an illustration. It could hardly become so interesting on account of its associations alone; the architectural character of the hall counts for much in men's minds. Like the law with which it is associated, the hall has little unity. The style of the masonry differs from the style of the woodwork. But a student fresh from Slade lectures at his University would not be much concerned about the clashing of styles; he would prefer to realise that the compound mass, with all its defects, is suggestive of a wealthy and powerful corporation that need not be anxious about the present or the future. The superabundance of ornamentation seems to be a necessity, for with a limited area to work in and an abundance of money and goodwill, what can be done except to impart costliness to every inch of space? It is a wonder the Benchers have not gone farther in the adornment of their hall. There is no need to point to the defects of the sixteenth-century designers; they would not be repeated in our time, but where is the money to be found that would raise a better hall?

It is strange that Sussex can offer us no better example of an Elizabethan or Jacobean house than Wakehurst Place. Not that the building is without interest, but from a county of so much importance we might expect something that would compare with the best examples of the style. It might be called a many gabled house, for every window in the two principal storeys has a corresponding dormer in the roof, which is surmounted by a gablet. The merits and defects of the treatment are thus described by the authors:—

The richness of effect is produced by tolerably simple means: by pinnacles and strings and sunk panels and other work which a mason could do without calling in the special skill of a carver. Nevertheless, the result is striking and unusually rich. Here, as in so many buildings of the period, the designer had an ill-balanced hand, for the details of the bays and strings are far more refined than that of the dormers. One naturally says "designer," influenced by the customs of to-day; but it is quite likely that in reality different men did the work, providing their own details, and that this accounts for the difference in treatment. Two other points are to be noticed about the bays: first, the fact that they are placed in a corner, so that one canted side looks on to the wall of the wing not three feet off. Second, the change from the canted bay to the square dormer over it is very difficult to manage successfully. Here it is done by means of a bracket, which, although an agreeable change from the ordinary corbelling, still leaves something to be desired in point of grace. It is a feature which pleases us in an old building, but would probably rouse our adverse criticism if adopted on the glaring stone of new work. The numerous dormers and gablets, each with its three panels, are exceedingly picturesque, and the treatment of the main gable, with the double step on the coping at its foot, is worth notice. The ruling desire for symmetry has led to the insertion of windows which are not only not wanted, but are in the way, and the middle window at the side of each wing is a sham, the disposition of the rooms inside not permitting of its going through the wall. This is a great defect in the design, and one which need not have been incurred, for not only does a natural and logical treatment carry its own defence with it, but plain spaces of walling are of great value in giving repose and enhancing the value of whatever ornament there may be.

Views are given of the north front and porch in quadrangle of Cobham Hall, in Kent, with one of the chimney-pieces. Unfortunately sham windows, which were one of

the consequences of a belief in Classic symmetry, are to be seen in this building. The mansion has also undergone alterations, but it still has enough about it to make it one of the most valuable survivals of a famous age.

The fifth part closes with plates of Hatfield House. There is no part of the building of more antiquity than 1611, but there is much of later date, which appears to be old. In spite of the interest which belongs to it the authors are forced to conclude that "there are not many piquant features about the house; it is a large and stately building, and depends for its effect upon size and symmetry rather than upon varied and charming detail." The great hall, the grand staircase and the long gallery are the parts which obtain most attention. In referring to the correspondence between the Lord SALISBURY for whom the house was erected and his foreman, the authors say the letters point to the practice of the seventeenth century, that is, "to the employment of independent workmen for the various trades; to the supervision of a local foreman with an occasional visit from a surveyor; and to the proprietor himself being the controlling influence in most of the matters which are now left to the decision of the architect." One consequence is that the research of the authors has not enabled them to discover the names of more than a very few of the designers who were associated with the buildings selected for representation. In spite of this drawback, the buildings must excite the interest of everyone who cares about the architecture of England, and Messrs. GOTCH and BROWN have earned the gratitude of their countrymen by their earnest efforts to demonstrate that in Renaissance as in Gothic we have some claim on a style.

THE INFLUENCE OF ART.

AT the annual distribution of prizes to the students of the Birmingham Municipal School of Art, an address was delivered by Mr. Holman Hunt. He began by recalling the original purpose of the provincial schools of design. Haydon, who first gained the conception of their necessity, saw that a strong national taste for design in manufactures and architecture, which in earlier days had existed—a taste which in the previous generation had culminated in goldsmiths and silversmiths' works from the invention of Stothard and Flaxman, and in ceramic ware of Wedgwood make—had suddenly disappeared, and had been replaced by the ugliest and vulgarest forms that had ever appeared on the civilised earth. It was not Haydon's purpose, therefore, that the movement he set on foot should result in an unreasonable increase in the number of painters of canvas and carvers of stone. It was a favourite canon nowadays that the object of all arts was to give enjoyment. That dictum should be so far qualified as to insist that the enjoyment should be of an enduring kind. Many of the newest—perhaps he ought to say the most advanced—schools in the profession would hoot him down as quite a perverse oracle; but he spoke as one who had outlived many storms, and as being bound to advise his successors according to his best convictions, without regard to the immediate popularity of his views. The English, as a nation, had up to the present day won the right to admiration for their art as spiritual, healthy, poetic, beautiful, and withal innocent, and he would urge students to honour those merits which made it distinct from our neighbours' art, and to take pains to retain that native individuality, and strive even to make it richer with those manly characteristics. A few years since, at the home of the great naturalist, Sir Richard Owen, he met his remarkable neighbour, Sir Edwin Chadwick, who began a conversation thus:—"As a commissioner of health, I must profess myself altogether opposed to the artistic theory of beauty. There is the Venus de Medici, which you artists regard as giving the perfect type of female form. In my view the figure is far from admirable. I should require that a typical statue with such pretensions should bear evidence of perfect power of life, with steady prospect of health, and signs of mental vigour. She has neither. Her chest is narrow, indicating unrobust lungs, her limbs are without evidence of due training of muscles, the shoulders are not well braced up, and her cranium and her face, too, are deficient in all traits of intellect. She would be a miserable mistress of a house, and a contemptible mother." And he ended the denunciation with, "Such kind of beauty I can't admire." When the listener assured the sage critic that he had made a most artistic criticism of the statue, and that his auditor would join in every word as to his standard of requirements, he knew that he was talking heresy to the mass of persons who accepted the traditional jargon of the *cognoscenti* on

trust. The fact was that the work belonged to the decadence of Roman virtue and vitality, and its merit was alone in the rendering of a voluptuous being without mind or soul, all unlike those noble figures in marble which the Greeks and Romans of earlier times left. When any insistence upon the duty of making art more than merely diverting to the senses was uttered, it was assumed that the doctrine enunciated was that at all times some especial moral or religious lesson should be enforced. He would by no means be understood in that sense; but he challenged anyone to deny that there were creations offered in the guise of art which were altogether unsound, flippant and immoral, and that they were produced by a school which ridiculed the claim that art should do more than beguile the idle fancy. From that view his own entirely differed because, seeing that the work would take a message of some sort to everyone who had eyes, it was simply Cain's contention that he was not his brother's keeper. The object of an artist should ever be to determine what was good on the sole ground of propriety of design, for that in the end would eliminate all that was base, and help the world to laugh to scorn all false pretension in the artist, whatever the theme might be to which he devoted his energies. Mixed up with much beautiful ornamentation among the remains from Pompeii were specimens of very nonsensical combinations in decorative art. Modern artists, too, often unthinkingly followed ancient ornamental style, imitating not the admirable spirit alone, but copying details with servile deadness. As an example, he might mention the frequency with which in stained-glass windows the clumsy proportions of Mediæval figures were given. His purpose that evening was to judge what the result of the taste inculcated by all art offered to the public would be. Would it tend to elevate or to lower a people taught to look upon it as beautiful? What a people admired, that it assuredly became. He who satisfied his eyes with the beauty of the degraded would have degraded offspring. Licinius knew that if men's intelligence grew used to seeing incongruity in ornament, their whole ideas of propriety would be disturbed, and their disordered minds would become receptive to other falsehoods. Art therefore was part of a nation's—aye, of eternity's soul. Some people were prejudiced against every appeal for art. They tacitly encouraged the thought that any indulgence of the taste should only be in a playful mood, and were quite ready to see art treated in the press as a kind of mountebankism, in which the merits of the conjuror were best proved by his smartness and noisiness, and by the number of coins the vulgar idler threw into his ring, and such responsible bodies as the Government and the Church found justification for avoiding it altogether. What was done for the little section of the latter which indulged in affected Gothicisms could not be considered as having anything to do with intelligent art. In truth, the pursuit of art should take its place among the sacred duties of the realm. All great nations had to leave an intelligible inheritance, one which had grown out of their own peculiar nature, in its siftings of the chaotic soil of the earth. The opportunity for art in a nation's life came but once, and lasted but a short time. Our own art was late-born. It had been only for private demand. It had never been extendedly national, for it had never developed its proper decorative branch. Dilettanteism had often misdirected it. Yet it had justified its right to stand even on the great throne dais which the race in its noblest children had built for poetry. He had to utter warnings lest at this moment what our fathers had gained we should lose. Of what value to their successors was the art of ancient nations? Few men of letters would refuse to admit the eternal worth of the works of the Assyrian sculptors. In the Greeks we found an elevation of insight of which there has been no foreshadowing, except faintly in early Egyptian times. The excuse pleaded for the later Egyptian artist was that he was by the priest ever hampered and hindered from the exercise of his higher ability. The submission proved the inferiority of nature. The Greek had too high a sense of the value of beautiful form to be restrained until he had reached perfection in his art. The ornamentalist took certain patterns in vogue from Egypt and Assyria, but in his hand they quickly grew into new life, and branched out into fresh streams of freshness and beauty. His treatment of the figure was equally independent. Every Greek, entering fully into the importance of the gymnast master's aims, and those of the physician who treated the tyro athlete, was prepared to understand the ambition of the greatest artists to reach from the earliest endeavour by patient strivings the matured glory of form of the perfect man. It seemed as though they, too, with the strange Hebrew nation, sought to teach that man was made in the image of God. This service was a sacred one, of great practical value to Greece, and ever since to the world. It taught us to sift away all artificial fashions, vanities of taste, all weak prejudices for superficial prettinesses which led weak taste to wrong judgment about form, and it led men to value as beautiful those proportions and shapes only, and that mien, that kingship of bearing, coming from habitual self-government, which together were the marks of the heroic race, marks

distinguishable in a nation which was master of its fate and teacher of future nations—

For 'tis the eternal law
That first in beauty shall be first in might.

This great fortune left by the Greeks was never gained by any *dilettante* trifling or the whims of the luxurious. The people watched the progress of each fresh discovery with rapture. It formed the diploma of the nation. It had helped the world ever since to love the hero, and to no nation had it taught the lesson more than to England, where a feminine man, a *petit maître*, a man helpless in difficulty, one who could not throw off his coat and reveal strength and firmness, had ever been despised. In this disquisition it might be interesting to note that until after Phidias the nude female figure was never represented in sculpture. The type of womanly grace was achieved in such holy spirit that it had stood ever since as a protest against every modiste's perversion of true form. Without it we might perhaps have adopted the Chinese contracted foot. We did sometimes have minor evils, but even the Greek standard of true womanliness rose up and shamed the attempt to distort it. But it was not the modiste alone that threatened evil. Often the canker came with the poetic strain that smelled of the midnight lamp, that dealt with the sickly and the morbid, that made melancholy and death alone its atmosphere—a poetry cultivated not by the hero, who loved life despite all its troubles, and who determined to lessen these, who glorified nature by the overflowing of his joyful and trustful heart—not by such a son of life, but by an egotist who had learned the words and counted the rhythm of the master songman in order to scatter his deadly tares in the field of the bread of life. How many failed to be proof against the insinuating deceit! How often the pernicious mood was adopted by the artist and the plane of his turbid world filled with images of the consumptive and the jaundiced woe-begone! To such unwholesome inviters to a hopeless Acheron feast the Greeks offered only perpetual derision, as they did to every taste born of a spirit crippled and cramped for the fullness of hearty humanity, because they knew that what a man loves that he will become. Another mode of describing full beauty was to say that it was perfect equipoise in form, just as justice was the due apportionment of rights. The cowardly artist obtained this equipoise by cutting away all redundant richness. He made a faultless face, but it had only the beauty of emptiness. He might say that he was inspired by the Greek spirit. That was a mistake, inasmuch as the balance of two empty scales was quite different from the equipoise of two full ones. In the perfect Greek face see how generous was the sculptor to give us every individuality in his model. False art dwindled a man's capacity of application. It made him believe that beauty was only of one type, that the desirable glory of life was to have no features that were noticeable. He wanted a nose perfectly straight, a mouth very small, eyes very large, the face a perfect oval, the feet and hands very small, the instep very high, and for a woman a swanlike neck. What nonsense! Harmony in music did not consist in the putting together of one set of notes. It depended upon balance. There was no end to the variety of celestial strains thus to be created, and there was no end to the different orders of beauty that existed in this cosmopolitan world. What a nation's taste loves most that its posterity would assuredly become. This came about not only by spiritual aspiration, but by the principle of natural selection, and without regard for the taste which could be inculcated only by robust art the thousand frivolous interests in conventional life would interfere with those marriages which were calculated to bring the nation to its highest point of perfection, and to—

That far-off divine event
To which the whole creation moves.

It must be noted that the Renaissance was inspired by the example of God's nature which the Greeks had given. The Italians recognised what it was in which the living dead were still masters, and, while bending themselves to the ground when reverence was due, they never became servile imitators. They knew that art must be a living breath of their own generation. The most imminent danger of art in the present moment was of opposite character. It was from what was called the realist school. We were told to recognise that to register facts was the highest ambition. Were the new principle a true one we should be wise in applying it to letters and saying that simple definition was art in the highest sense, whereupon the auctioneer's catalogue would become the highest form of literature. For his part he had a prejudice for the older light. If beauty and grace as angelic ministers were not sought for, the painter and sculptor might be sure that they would leave him to his duller spiritual friends, and if we let the brute in us have the mastery he would glory in his domination.

Mr. Bunce moved a vote of thanks to Mr. Holman Hunt for his address, which was seconded by Alderman Kenrick.

Mr. Holman Hunt, in replying, said it was in Birmingham

that he obtained one of the first prizes he ever received—a prize of 60*l.* for *The Strayed Sheep*, exhibited at the gallery of the Royal Society of Artists. Following upon a similar recognition at Liverpool, that mark of appreciation did much to cause people to consider the purposes of the pre-Raphaelite brotherhood for themselves, and so to swell its ranks.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE eighth ordinary meeting of the Institute of Architects was held on Monday evening, Mr. J. Macvicar Anderson president, in the chair.

The decease was announced of two members—Mr. William Allen Boulnois and Mr. John Myrie Cory, of Shanghai.

Terra-Cotta.

Papers on this subject, in connection with the Art Standing Committee, were read by Mr. E. Ingress Bell, Mr. S. H. Leach (of Doulton & Co.) and Mr. Leonard Stokes.

Mr. E. INGRESS BELL, who read the first paper, said he would advocate the use of terra-cotta on general and broad grounds. Terra-cotta was a new material placed in their hands, the careful and intelligent use of which would lead to good results in design. Architects in all ages had addressed themselves to the solution of architectural problems in brick, stone and marble, and so successfully that the results could not be surpassed. Architects working in those materials could not hope to strike out anything new. The treatment must be similar, and the best work too often repeated failed in its effect. In what direction could relief be sought from the tyranny of precedent? Elementary forms could hardly be expected to be capable of alterations. General principles would always hold in regard of lintels, arches, roofs, &c. Any relief to be got must be confined to details. By attention to detail alone would they be able to differentiate historic styles and give expression in architectural style. Did the peculiar qualities of terra-cotta open out new possibilities? He hoped so. An objection urged in disparagement of terra-cotta was that it was a cast material. Hitherto, to speak of any material as cast, was to condemn it. But cast-iron was now coming into fashion again. Why not also terra-cotta? There was no evil in obtaining good results by a short cut. Moreover, the use of terra-cotta was not limited to cast work. The clay could be run or moulded directly by the artist, or the methods might be combined. An artistic hand could easily and swiftly embellish forms supplied to him. Another objection urged against terra-cotta was that the clay shrinks in the kiln. That objection was not, he thought, a serious one. It would be foolish to try and catch the beautiful effects of Greek work in terra-cotta, but there were other forms that were adapted to the material. Lines without being rigid or formal would produce a sketchy and effective appearance. A more formidable charge was that terra-cotta did not weather, but the charge was not wholly true. Much depended on the texture, but it was slow in assuming tone and parti-coloured appearance. The atmosphere of our towns finished off our buildings in black and white, without regard to the proper effects of light and shade. Hence it was a practical question to ask if buildings should be covered with materials that got daubed over thus in black and white, or if they possessed in terra-cotta a material not so affected it should be used? As he had already said, there must be careful and intelligent use of terra-cotta. The designer must have cultivated taste to design what would be worth having. The mind must be divested of the habit of thinking in stone. The two materials demanded an entirely different treatment. It must be realised that the methods of treating stone were inapplicable for terra-cotta. Stone and marble were costly, also their working and their carriage. All the conditions were changed, however, in working good-tempered clay. There was no limit as to design and detail, and in colour there was variety. The development of design in terra-cotta should be carried forward as our predecessors had done with regard to stone, and if he could not suggest that a nobler form of architecture would be arrived at, new and legitimate forms might be developed.

Mr. S. H. LEACH described the various clays, from the plastic clay of Devonshire to the firebrick clay from the coal-measures. Refractory *versus* plastic clays he described as not suitable for delicate moulding or for added ornament. The granular structure was, however, good for rapidity in drying and suitable for long mouldings. Plastic clays, though suitable for ornament, could not be made in large blocks. Colour in terra-cotta chiefly, but not entirely, depended on the amount of iron present. It was generally burnt in open kilns; that burnt in muffles was in colour more sickly. A certain Leicestershire clay had so much iron that it was red before it was burnt, but at the same time it was so charged with lime that it came out nearly white from the kiln. In some clays soluble alkaline matter was present, which by burning became insoluble, and

produced unpleasant markings. Mr. Leach described the process of manufacture, but said he failed to see the mould was the best method to use for clay except in respect of economy. Corbels, soffits and similar features in terra-cotta did not cost anything like the same in stone. The characteristic of the direct process work was plasticity, and a little practice showed how well such clay lent itself for applied ornament; the modeller enjoying far greater facilities in his work that was afforded to the wood-carver. Several methods of treatment open to the designer were alluded to, and how to avoid difficulties of distortion in the burning, mentioned. Cellular terra-cotta was next dealt with and its advantages for casing ironwork enlarged on. This it appeared could be kept in stock which could be produced plain or ornamental as required. The work could be so perfectly done that the eye could not perceive any falseness. Terra-cotta and concrete as a constructional combination was then described, and its suitability to meet practical needs as well as the purses of clients explained.

Mr. LEONARD STOKES in his paper dealt with the disadvantages of terra-cotta substantially to show that it had no constructional value, and that as applied to ornament it failed to satisfy needs, and that among other objections there were numerous instances of its shortness of life. It seemed to him superfluous to say a word against the use of terra-cotta, as they were obvious on examination. He had never used it, and he hoped nature would never cut him off from a supply of proper building materials. He deprecated bringing about his ears a nest of terra-cotta hornets, and therefore explained that his objections were *bona-fide* objections. He contended that it was a mockery to think that there were any business advantages or constructional properties to recommend terra-cotta in place of natural materials. Weight-carrying power it had none; that had to be supplied by cement concrete—in other words, not being constructional, strength must be otherwise provided in practice. Cellular blocks, a better kind of terra-cotta, were apt to burst under fire, and they, unlike good bricks, would not stand weight. Mr. Stokes described another objection to an architect using terra-cotta—the delay of the manufacturer in supplying it. It arrived perhaps at last, and was found to be underburnt, but the joy of getting it at all led to its being used instead of being rejected. Its wear was said to be everlasting. If so he was sorry for it, but that was not so, for an examination during the past fortnight of several buildings in London, ten years old at least, had shown him signs of crushing and disintegration, and one of these buildings was Messrs. Doulton's establishment at Lambeth. An architect friend of his declared he would never use terra-cotta except as a casing for iron construction. It might be useful for damp-courses, perhaps, but very ugly. He instanced a church interior having piers and arches of terra-cotta, but was sufficiently disgusted to hear that disguised iron stanchions carried the weight. He could see no artistic advantages in the use of terra-cotta. There was a chance of getting a noble and dignified effect with marble. In terra-cotta work there was an absence of reticence and a display of sensuality, the effect of which was bad. The effects of age and time had already improved the Law Courts, a colour was coming over them, but the Natural History Museum at Kensington still remained unsympathetic in appearance. If Mr. Norman Shaw, Messrs. Bodley & Garner, &c., had taken up terra-cotta, it had only been to drop it like a hot potato. Architects had always made use of materials available to hand, and would never have abandoned stone for terra-cotta. The restorer of buildings had long since set his face against cement-covered buildings, and he believed our children would rise up against earthenware and pottery buildings. As to a business question—that of cost—said to be cheap, it was dear at any price, and further, he could prove that a dignified building and a well-designed building could be put up as cheaply in Portland stone as one of terra-cotta. Also, it was a delusion as a business material by reason of delay, and consequent loss of capital and interest. He held that, theoretically as well as practically, it was an unfitted and degraded material. His advice to those about to use it was that of *Punch* to those about to marry, "Don't!" Good terra-cotta work was to be seen on the Continent where stone was scarce, but that was rather moulded brickwork. In conclusion, he might have condensed his paper, he said, into two lines, including the title, as follows:—"The Advantages of Terra-cotta." It has none.

Dr. MURRAY, of the British Museum, being invited to speak made no remarks on the subject proposed for discussion, but called attention to specimens he had brought of Greek work dating B.C. 600, found by Lord Savile at Civita Lavinia, from excavations carried out in one of his vineyards, and also specimens from the Villa Giulia, Rome. He trusted that further discoveries would put into their hands a more definite solution of this work than at present could be formed.

Sir HENRY DOULTON having been asked to speak, said he had been proud of being a potter till he came to the meeting that night. He alluded to the figure of Britannia at the Exchange, Liverpool, one hundred years old, and other two

statues in London, seventy years old, showing that terra-cotta was absolutely imperishable. When they had the fire at Lambeth the only material that withstood it was the terra-cotta.

Mr. BRYDON proposed a vote of thanks to the three gentlemen who had read the papers. He contended that no case had been made out for the use of terra-cotta where other materials were available. In public buildings they wanted the noblest materials with the noblest design and the best possible workmanship. After marble came stone as the noblest material, and stone we could always get. The fact that terra-cotta as a material could only be produced in small blocks must be taken into consideration; that tended to cramp anything like bold design. Why should architects hamper themselves with a material they had no need for? As to cost, it was better to build twice over in stone than once in terra-cotta. As far as actual cost was concerned Mr. Brydon quoted the following estimates for the Battersea Polytechnic, viz.:—Bath stone, 4s. 8d.; terra-cotta, 5s. 11½d.; Portland stone, 6s. 9d.—10s. per rod to be added for labour for terra-cotta if used, so that, labour included, even Portland stone cost only 9½d. more than terra-cotta. That, he thought, disposed of the question of cost. Further, he did not consider all the ornament proposed to be got by use of terra-cotta was wanted; it was superfluous ornament. It was bringing down architecture to furniture-designing—doing little things big instead of doing big things.

Mr. C. FOSTER HAYWARD spoke in favour of terra-cotta. He called attention to a slight restoration by Mr. Norman Shaw at Layer Marner, and said he had himself used terra-cotta in a stone district (Plymouth) along with limestone and local granite, and that it had shown no signs of deterioration.

Colonel EDIS, F.S.A., controverted all that Mr. Stokes had urged, saying he had dealt unfairly and unjustly with the subject. Without mentioning what the cost was, he said it would do him, as the architect of the Constitutional Club, great injustice to let Mr. Stokes's statement as to the cost pass unchallenged, but it was nothing like what Mr. Stokes had stated. He referred next to terra-cotta work in North Italy, notably that at the Certosa. Were architects never to employ a material that was new? Portland stone did not wear well in London—decay could be seen in the stonework of Somerset House. He was surprised to hear Bath stone mentioned for comparison. They need only see Lord Salisbury's house in Arlington Street to judge of it. Terra-cotta was not the only material in getting which delay took place. It afforded endless opportunities for artistic treatment. Though many had spent their lives in studying its capabilities, Mr. Stokes had acquired his knowledge of the material in a fortnight.

Mr. JAMES NEALE, F.S.A., seconded the vote of thanks. While admiring Mr. Stokes for his outspokenness, he expressed himself in favour of using terra-cotta provided the temptation to prettiness did not lead the designer into over-ornamentation.

Mr. ASTON WEBB argued in favour of terra-cotta because Mr. Stokes had only a fortnight's study of it, and because it was not the only material that was not self-supporting.

Mr. J. C. EDWARDS, of Ruabon, asked by Mr. Stokes to give an idea of what the estimate would be for terra-cotta for a building similar to the Constitutional Club, said quantities had not been supplied to him, and that he had left a good margin for profit.

The vote of thanks was put to the meeting by the President and carried by acclamation. It included Mr. Bell, Mr. Leach, Mr. Stokes, Sir H. Doulton, Mr. Edwards, and Messrs. Gibbs & Canning, of Tamworth, specimens of the work of these firms being exhibited on the occasion.

TESSERÆ.

The New Town, Edinburgh.

THE tameness which exists in the original conception of the plan might have been much relieved by the architecture. But, to say truth, men's minds were not at that time ripe for the splendid ideas which have been since entertained. The new town, at its commencement, had to struggle with the rivalry of George's Square, and with the prejudices of persons attached to the old city, who predicted loudly that the plan would altogether fail. The buildings, therefore, at the east end of Prince's Street were necessarily undertaken on a moderate scale of expense, and even those of St. Andrew's Square, though good houses within, present no decorations on the exterior, excepting on the east side, where an example has been set by the magnificence of Sir Lawrence Dundas, who built for his own residence the handsome hotel afterwards occupied as the Excise Office. Unquestionably, any plan which could at that time have been proposed for breaking the uniformity or adorning the monotonous simplicity of the new town, whether by introduction of more public buildings or by ornamenting the exterior of private houses, and concealing with blocking-courses

the long, mean line of sloping roofs, would have been a serious obstruction to the general success of the undertaking. Yet every eye is now sensible that George's Street, otherwise so handsome, is rendered mean by its extreme breadth, which extends betwixt two lines of low houses, whose broad, slated roofs are unbroken and undignified by projections or occasional elevations. Our criticism, indeed, applies even to circumstances connected with the original plan of the new town, for which the poverty or narrow spirit of the times in which it originated forms no sufficient answer. It unfortunately occurred to some of the parties concerned that the earth dug out of the foundation of the new houses might be employed to advantage in forming a communication with the old town, by the creation of that mound of earth which is now extended across the valley. For this purpose the proprietors and builders of houses were bound, in their contracts with the city, to excavate their front areas to a certain depth, in order that each might contribute a share of earth to a great end, as it was then thought, most useful undertaking. This was the origin of that huge deformity which extended its lumpish length betwixt Bank Street and Hanover Square, the most hopeless and irremediable error which has been committed in the course of the improvements of Edinburgh, and which, when the view which it interrupted was contrasted with that which it presented, was, and must be, a subject of constant regret and provocation. Had the areas formed in the new town been no more than half their present depth, the following consequences would have necessarily arisen:—1. The fears, relieved of a very considerable expense, would have been able to pay a larger ground-rent. 2. The houses, being higher by the half-storey which is now buried below ground, would have acquired more dignity and importance. 3. The surplus saved would have been more than sufficient to build a handsome arched bridge where the earthen hulk extends itself, furnishing all the convenience now derived from that mass of deformity, and substituting instead an object of high architectural beauty. The new town of Edinburgh, as originally planned, contrary to every prediction which had been uttered on the subject, was built and occupied within forty years after it had been commenced.

Turner as an Illustrator.

Turner's skill and reputation recommended him both to printsellers and publishers, but none of the larger engravings from his works were very successful speculations, though the gravers of the two Cookes, of Miller, Goodall, Prior, Pye, Wallis and Willmore were employed to translate them into black and white. He was careful, too, in touching upon the proofs, and added many master strokes of effect in this way, so that no pains were spared to give them every recommendation; and yet with all this they did little more than cover their expenses. The "Tivoli" and "Temple of Jupiter" should have made money. His book-plates, such as his views on the southern coast, his three annual tours on the Seine and Loire, and in Scotland at an earlier period, for the "Provincial Antiquities," were more successful. He was happy, too, in the numerous illustrations which he made for the monthly issue by Cadell of Scott's poetry and miscellaneous prose works in forty volumes. His drawings for Murray's seventeen-volume edition of Byron are occasionally in his best manner. Still better are his illustrations for the "Italy" and other poems of Rogers. He was not so good in what he did for Campbell's poems, or for Moore's "Epicurean"; and when he ventured to furnish seven illustrations to Sir Egerton Brydges's edition of Milton, he was hardly equal to the task. His seven subjects were, however, well chosen:—"The Mustering of the Rebel Angels," "The Fall of the Rebel Angels," "The Expulsion from Paradise," "The Temptation on the Mount," "The Temptation on the Pinnacle," "Ludlow Castle and the Rising of the Water Nymphs," "St. Michael's Mount and the Shipwreck of Lycidas." The drawings, of the same size as the engravings, are exquisite pieces of colour and effect. "The Shipwreck" (a favourite subject with him) is the happiest of the seven. For his drawings for books he received prices varying from twenty to twenty-five guineas. Some he lent, those executed for Rogers and Campbell, for instance, and got good prices for the right of engraving them; others, that were sold outright, passed from the publishers into the hands of collectors. Mr. Windus obtained the sixty-four illustrations of Scott at twelve guineas a drawing. Mr. Munro bought the illustrations for Milton, the publisher of the Milton (Mr. Macrone) getting his money back, it is understood, by the sale of the drawings. It was indeed a more than safe speculation to employ him in the illustration of books. His twenty drawings for Whitaker's "Richmondshire," for which he received twenty guineas a drawing, were sold by the publishers, some at a little below cost price, and have since brought sums varying from eighty to one hundred guineas each. His travelling expenses, when he worked for publishers, were paid for separately, and it is right to add, what Cadell has been heard to declare, that he was moderate in his charges. His habits of saving were not confined to his own pockets.

An Estimate by Wren.

The following "Estimate of finishing part of Hampton Court" was sent by Sir Christopher Wren to William III.:—"To the King's most excellent M^{tie},—May it please y^r M^{tie}, your M^{tie} having been graciously pleased to signify y^r Comandes to me, that I should give an Estimate of the expence of fitting the Inside of the Roomes of State at Hampton Court, from the entrance out of the Portico to the roomes already finished above staires, containing the Great staires, the Guard Chamber, the Presence Chamber, Privy Chamber, Drawingroom, Anteroome, Great bed chamber, Lobby and Gallery for the pictures; in pursuance of this comand I humbly represent—That although a perfect estimate of Finishing the Inside of any house is as uncertain as the charge of Furnishing, & is more or lesse according to the intention of the Owner: yet, upon supposition that your M^{tie} would finish as decently as the greatness of the Roomes seemes to require, and having consulted y^r M^{ties} Officers of the Workes what is requisit to be don & the charge of each Roome, I have represented the Worke of each Roome & the totall Expence as followeth:—1. The Great Staires to be made with Steps of the Irish Stone, such as are at Kensington, but longer & easier, with Iron Rayles of good worke; the Floor and Harthplaces to be well paved with Marble; the Walls to be wanscoted 20 foot high, with five Dorecases. 2. The Guard-chamber to [be] fitted for Armes as at Windsor, and other Houses. 3. The Presence-chamber to be fitted for Hangings, with Marbles in the Chimny and the Stooles of the Windowes, and proper Ornaments. 4. The Privy-chamber in like manner. 5. The Drawing-room with some variety, as having the best Furniture. 6. The Anteroome well finished. 7. The Great bed chamber to be perfected. 8. The Gallery to be fitted for the Cartoons with Wanscote on the Windowe side and below the Pictures, & between them, and with wanscote behind them to preserve them from the walls, & with a Marble Chimny & Marble Soyles in the Windowes, and other things proper to complete the same. 9. The Lobby between the presence and Gallery to be ceiled & finished. 10. The boordes of all these Roomes (being already provided very good & drie) are to be laid after the best manner, without Nayles & with battens under the Joyntes. The Expence of this Worke, thus performed by good Artists will amount to the Summe of 6,800*li*. All the Insides of these Roomes have been long since designed, and shall be presented to your M^{tie} for your approbation & correction, & accordingly the expence may prove more or lesse; but I am humbly of opinion the worke may be decently performed to your M^{ties} satisfaction for the Summe above mentioned. It may be farther considered, that other things will be required for the accomodation of those who are to be near your Royall person, and that the Courtes must be paved, more Sewers made, and the Water brought to more places; and other things necessary for your M^{ties} service; which may be estimated as they are directed: All w^{ch} is most humbly submitted.—April 28, 1699. CHR. WREN."

Mediaeval Sculpture.

It is most curious to observe how profoundly, and yet how lucidly, works of art reflect the ideas of the epoch in which they were executed. When society was governed by the clergy, that is, from the fifth to the ninth century, the art is found grave and austere; faces, whether in sculpture or painting, are imprinted with one universal character, and never are they seen to relax into a smile. From the ninth to the thirteenth century, during the period of feudal sway, the attitudes become stiff; something arrogant is remarked in the general bearing, something of audacious daring in the expression; the features throughout bear the impress of courage, but mingled with harshness and severity. Subsequently, from the thirteenth century down to the fifteenth, when the bourgeoisie had taken root and propagated themselves in the emancipated communes, the art bent before their influence. The stiffness that had prevailed in the preceding epoch was succeeded by varied action; the savage character degenerated into the familiar, and nobleness of features into vulgarity. The ideal was lost in the real. Yet the type of man at this period was furnished by the "bourgeois" of the middle classes, striving to imitate the noble, whose rank they aspired to gain, and consequently still wearing some semblance of elevation of mind, and displaying an eager desire for distinction. But between the fifteenth and sixteenth centuries, a nameless crowd, a populace in rags, with garments torn, and marks of poverty in figure and in habiliments, their physiognomy and outward expression invariably common, and too often rude and barbarous in soul, broke loose upon the political and artistic world. The irruption of this vulgar crowd troubled the course of æsthetics, and its dull, heavy countenance intrudes on the most elevated ideal conceptions. It is possible, by close study, to discover in the sculptures of cathedrals, in painted glass windows, and the miniatures of illuminated manuscripts, variations of feeling indicating a difference of period: a material difference—an individuality—may even be discovered in edifices of the same era, but erected in different

countries. Thus, in the cathedral of Paris, as has been often remarked, confessors rank higher than martyrs, that is to say, intellect is more highly venerated than faith. At Chartres, on the contrary, faith takes precedence of intelligence, martyrs of confessors. In the church of Notre Dame de Brou, founded by a woman, the primal virtue is charity. During the Renaissance, when men were Pagan rather than Christian in sentiment, not one only of the theological virtues was neglected, but all three at once, and the four cardinal virtues were substituted in their place—prudence, justice, temperance and strength—moral virtues exalted in pagan times far above all others. In short, the personified virtues represented on Christian monuments testify by their nature, their number, and the rank they occupy; the social condition of the period and country in which they were produced.

Influence of Greece on Indian Art.

The architecture of India begins (as unequivocally stated in 1855 by Mr. Fergusson) with a strong admixture of Greek art, the effects of which we are able to trace for centuries in the architecture of the valleys of Cashmere and Cabul. The classical character of the extensive collection of the Buddhistic sculptures from the neighbourhood of Peshawur, which have been exhibited by Dr. Leitner at the India Museum, is unquestionable, and incontestably proves the direct influence of Greek art on the architecture of India throughout the whole period of the culmination of Buddhism in India. In the Cashmere temples, which were all built between the fall of Buddhism and the rise of Mohammedanism, the Greek influence was still very marked. "Nowhere in Cashmere," says Mr. Fergusson, "do we find any trace of the bracket-capital of the Hindus, while the Doric or quasi-Doric column is found everywhere throughout the valley in temples dating from the eighth to the twelfth century A.D." Indirectly also, Greek art has probably influenced the architectural and other arts of India through the Sasanian art of Persia. From the Mohammedan conquest of India the further development of Buddhist art is to be traced chiefly beyond India in Tibet, Burma and China, in which countries Buddhism has prevailed without any interruption for more than 2,000 years, among races of mankind closely allied to the Turanian population of the Gangetic valley, who first evolved the religion of Buddha, and spread it with its characteristic architecture over south-eastern and eastern Asia. It would be interesting to trace the influence of the introduction of Buddhism into America in the fourth or fifth century A.D. on the architecture of Mexico.

Heralds' Visitations.

It was at one time the custom for the heralds to make visitations, as they were called, amongst the various nobles and landed proprietors, for the purpose of inquiring into and setting right all irregularities connected with armorial bearings, and for compiling the necessary records. Of so much importance were these visitations held at the time, that they took place by virtue of a commission under the privy seal, to the two provincial kings of arms, authorising and commanding each of them, either personally or by deputy, to visit the whole of his province as often as he should think fit, to convene before him all manner of persons who pretended to the use of arms, or were styled esquires and gentlemen, and to cause those thus summoned to show by what authority they claimed the distinction. Great and almost unreasonable powers were granted to them for the carrying out of these objects. They had license not only to enter, upon reasonable request and at reasonable hours of the day, into all churches, castles, houses and other places, to peruse therein all arms, cognizances, crests, and other devices, and to record the same, with the descents, marriages and issue in register books—which are now so well known as the visitations—but also to correct and reform all bearings unlawfully usurped or inaccurately adopted, and in certain cases to reverse, pull down, and deface the same. The mode of procedure was this. On arriving at the place wherein the visitation was to be holden, the provincial king issued a warrant, directed to the high constable of the hundred, or to the mayor or chief officer of the district, commanding him to warn the several knights, esquires, and gentlemen particularly named in such warrant, as well as others within his jurisdiction, to appear personally before him, at the house and on the day specified, and to bring with them such arms and crests as they then bore, together with their pedigrees and descents, and such evidences and ancient writings as might justify the same, in order to their being registered. On the day appointed, the provincial king or his deputy attended, and so long as the laws of chivalry were honoured and esteemed, general attention and respect were paid to these summonses; attested pedigrees were submitted to the heralds, and thus were produced the important registrations which have preserved to the present period many a line of descent that would otherwise have been irretrievably lost.

NOTES AND COMMENTS.

THE judge of the Swansea County Court, Mr. GWILYM WILLIAMS, on Friday last was emphatic in condemning the defence that was set up in an action that was brought for the recovery of architect's fees. The plaintiff, Mr. EDWARD BATH, of Swansea, was asked to prepare plans for a hotel, with specification and quantities. He submitted them to the licensing justices, by whom they were approved. Some good-natured friend afterwards suggested that the specification was not what it ought to be, and the client in consequence tried to get out of her undertaking. Mr. BATH thereupon brought an action to recover 98% for his services. The defendant counterclaimed 100% loss incurred through plaintiff's negligence. Judgment was given for Mr. BATH. As regarded the defendant's claim, the judge said it was based on an allegation of fraud. He would not use the term "disgraceful," but it was certainly very bad taste to suggest fraud. He did not find that there was any fraud, and not for one moment that the tender was a bogus one. The items alleged to be bogus were items usually inserted, which could not affect the building and the mortgagees' security. He would go further, and say it did not matter to the issue whether they were bogus or not, for, from her letter, the defendant was the responsible person, and how could she accuse a man of going for a "bogus" tender and the counterclaim upon them? Judgment was accordingly also given for Mr. BATH on the counterclaim, with costs of witnesses that were called to rebut the allegations made.

PUBLIC bodies in Scotland appear to imagine that plans for buildings are as easily prepared as exercises in schools. The Brechin Police Commissioners are eager to have municipal buildings, and accordingly they offer 25% for the set of plans that is adjudged best, and another of 5% for the next best. The advertisement further announces that the best plans "will become the property of the Police Commissioners, who will be entitled to use them as they see fit." The attention of the Dundee Institute of Architecture, Science and Art has been called to the project, and it was decided to forward to the Commissioners a copy of the Institute's conditions, with the suggestion that they should conform therewith. But as long as the Commissioners are aware that there will be no lack of plans submitted to them, we fear they will not care much about the appeal of any society. If the Dundee Institute could persuade northern architects to refrain from competing for a five-pound prize there would be fewer projects of the Brechin class.

It may not be generally known that KARL GRUNOW, who was respected during many years as director of the Technical Art Museum in Berlin (he died on February 16), was originally an architect. He co-operated with GROPIUS in building the museum to which he afterwards was attached. His duties as director engrossed so much of his time he was unable to practise his art. But he occasionally was able to render service by his advice when memorials of many kinds were being produced. It is well known that the precious silver table which the city of Berlin offered to the present Emperor on his marriage, and the great bronze tablet which the Prussians gave to Field-Marshal MOLTKE on his ninetyeth birthday, owed much of their character to the inspiration of GRUNOW. The director was also an inventive mechanic.

ABOUT three years since Madame SCHLIEMANN made a promise that the excavations which her husband had commenced at Hissarlik shortly before his death were to be resumed. There were several obstacles to be overcome before her desire to carry out the trust could be realised. There need be no longer any delay. Dr. DÖRPFELD, who was long associated with the late Dr. SCHLIEMANN, and whose competence as an archæologist imparted additional interest to the later excavations, has undertaken to complete the exploration which his friend commenced. He will start from Athens, where he has charge of the German Institute, on April 11. Dr. DÖRPFELD will be accompanied by several of his countrymen who are studying in Greece,

They will be glad to render assistance in so interesting an undertaking. It is anticipated that besides these experts there will be several visitors from Germany. Let us hope England will not be without representatives. We need hardly say that those who are not present at the opening of the excavations are likely to miss that part which is the most interesting of the spectacle. The remains may become friable soon after their exposure, but the vision of them must be invaluable; and if they are skilled there can hardly be too many observers present to record the phenomena.

EVERY year there is a commemoration of celebrities in Paris by calling streets after them. In the latest proposals artists are not forgotten, HITTORFF, PIERRE BULLANT, the architects; LANÇON and RIBOT, the painters; CHAPU, the sculptor; DECK, the ceramist; and ALPHAND, the late director of municipal works, are among the favourites in the Municipal Council. The name of JEAN LECLAIRE, the house-painter, is also to be inscribed on an enamelled plate, but it is not, however, on account of his merit as a decorator, but as a recognition of his experiment in sharing the profits with the workmen. Although he introduced co-operation more than half a century ago, LECLAIRE has obtained scant attention from the official awarders of fame, and the statue of the pioneer of co-operation is not among the notabilities that appear on the exterior of the Hôtel de Ville.

ONE of the minor questions with which the French Government is expected to deal is the admission of lady students to the Ecole des Beaux-Arts. The opinions of some painters on the subject has been solicited. M. BONNAT does not deny the right of women to take up painting and sculpture, but he doubts their possession of either the physical force or the intellectual power which would be necessary for success. Nobody can imagine a female MICHEL ANGELO, TITIAN, RUBENS, REMBRANDT or RIBERA. M. BONNAT believes that women were not sent into the world to paint and model; they have something better to do, and their true rôle is so noble and elevated they need not envy the artists. M. CHARTRAIN holds that on no account ought womankind be admitted either to the courses of lectures or to the ateliers. M. CAROLUS DURAN, on the other hand, recognises the right of women to follow the same studies as men, but he would have special ateliers for them. M. HENNER, in a characteristically quiet way, professes his ignorance about the courses which the ladies are eager to follow, but he considers that already there are far too many for men in the Ecole. His neighbour, M. PUVIS DE CHAVANNES, declines to express an opinion. M. JEAN BERAND expresses the most modern idea when he says that men as well as women should be kept out of the Ecole des Beaux-Arts, which he maintains is an institution that is absolutely useless if not dangerous. Under the circumstances the Government will be excused for adopting the prudent *laissez-faire* policy.

IN the competition for the Mills Grammar School for Girls, Framlingham, sixteen sets of designs were submitted. The plans selected are by Mr. FRANK BROWN, architect, of Ipswich. The designs of Messrs. GEORGE J. & F. W. SKIPPER, architects, of Norwich, were awarded the second place, but the premium was declined, the architects preferring to have their drawings returned to them.

THE *Art Journal* was so successful in publishing the Vernon Gallery and other paintings that were presented to the nation, the conductors may be considered to have a prescriptive right to be accepted as entitled to reproduce the Tate Gallery. The first etching appears in this month's number, the subject being the *Vale of Rest*. It is not the work that is best suited to start with, but it appears to be No. 1 in the catalogue. Mr. G. O. MURRAY has done his best to impart interest to unsatisfactory materials, but with so morbid a subject, who could succeed? The number does not depend for attractiveness on one plate. There are numerous illustrations, and readable articles by Mr. DAY, Mr. MACCOLL, Mr. ARMSTRONG and Mr. E. BROWNE.

ASCOT WOOD HOUSE.

DESIGN FOR ENTRANCE TO A CHAPTER-HOUSE.

IN the instructions for the Soane Medallion Competition, 1892, subject "Design for a Chapter-house," the entrance was expressly mentioned for illustration and design, together with the cloisters. The sheet here given was entirely devoted to this subject.

An ambulatory was carried round the main fabric, connected with, and on the same level as, the cloisters, the chapter-house itself being raised about 8 feet above these walks, thus necessitating the staircase illustrated.

The plan, which has been added for the purpose of this illustration, is drawn to show more clearly than in the original one the simple lines on which it is set out: Two squares placed diagonally over each other, the projecting angles forming a distinct bay in the ambulatory to every face of the octagonal chapter-house. The style throughout was late fifteenth century. The design is by Mr. HEBER RIMMER, of Chester, to whom the Soane Medallion was awarded.

SACHSENHAUSEN, FRANKFORT.

[By an oversight Mr. COLLUTT's name was given as that of the architect of the premises in Mount Street, published last week, instead of Mr. A. J. BOLTON's.]

THE ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, Mr. H. O. Cresswell, president, in the chair. Mr. G. Tolley and Mr. J. A. Smith were elected members. Mr. ARTHUR STREET, M.A., read the following paper, entitled—

Originality and Individuality in Art.

In making a few observations to-night on the subject of Originality in Art, I shall begin by offering the smallest possible contribution to the literature of the much-vexed and well-worn question whether or not a new architectural style is possible. The question seems to me a perfectly futile one, but there have been not a few in the past who have been unwilling that the nineteenth century should pass away without having affixed its signature definitely to some new development, or even to some new birth, always to be associated with its name thenceforward. Such an aspiration tells for me a sad story of self-importance, and is indeed no bad symbol of an age which has created advertisement as a fine art. A style started under such auspices, properly perfected in all its parts, and duly patented, should, in the eternal fitness of things, become the stock in trade of a limited liability company, pass through a fitful and fevered span of existence, secure, who knows, a quotation on the Stock Exchange, and be buried at last with becoming obsequies by an official receiver. Let the style grow if it will, but let the aspiration take care of itself. I can conceive of no Zeus among architects from whose teeming and fertile brain such another Pallas Athene should spring, fully grown and completely equipped. When, indeed, may we ask, in the whole history of the world has there been originality in the sense of absolutely new invention? Modification and evolution have been the watchwords all through. Those who cry out for an original style ask, as I understand them, for a tabula rasa on which to inscribe hieroglyphics never before seen, or combinations of forms without precedent. They ask for an artistic cataclysm, for a labouring of the mountains and a new and strange birth, but history will tell them that the most fundamental changes have been happened on rather than discovered, that forms have existed as results before they were recognised as the embodiment of new principles and the starting-point for fresh enterprise. All growth must be gradual; the new must germinate in the decay of the old: there is no solution of continuity in the process, no moment at which you can say that the change in degree has become one in kind, or you might argue that one moulding makes a style, as the sophists of old that one grain makes a heap. Further than this, all experience tells us that in the sphere of Art, unlike that of Science, the limit of perfectibility is reached while the study is still, comparatively speaking, in its youth. "Those arts," it has been said, "which depend on individual genius and incommunicable power have always leapt at once from infancy to manhood, from the first dawn of rude invention to their meridian height and dazzling lustre, and have in general declined after. This is the peculiar distinction and privilege of each, of Science and Art; of the one never to attain its utmost limit of perfection, and of the

other to arrive at it almost at once. In after ages great men have arisen, one by one, as it were, by throes and at intervals, but, in the earlier stages of the arts, they rose by clusters and in constellations."* But I am flogging a dead horse, and am content to believe that the day for such crude imaginings has gone never to return, and that every one of us here realises that the mere entertainment of such an ambition stamps a man as singularly ill-fitted to make the experiment. For my own part, I wish we could sink styles in style, and cultivate pure beauty of form and constructive propriety without troubling ourselves in any given instance what our sources of inspiration may be, or whether or not—if we care to run them to earth—they are all referable to one date of work. It is not every one who can practise so bold an eclecticism, if I may use such an expression of an artist whose work can never have been consciously derivative, as Mr. John Sedding: to attempt to conjure with edge-tools, as he did, is for the prentice-hand to court death by the happy despatch; but when once we have gone thoroughly and systematically through the educational mill, when the mind has been impressed for good and all with the varied outcome of centuries of artistic energy, all of which the man of broad sympathies, who can feel the common principles underlying the different forms, may well enjoy; when the artistic sense has been cultivated and the proper appreciation of beauty has become an instinct, then it is time to throw off the leading-strings which, when they have ceased to guide, have begun to hamper us, and step boldly out into the field of practical architecture to do or to die.

One sees the pedantic attitude of mind to which I demur—the cultivation of the letter rather than the spirit—in the small body of amateurs who make the study of architecture their relaxation, and one sees it there perhaps at its worst. The building is too often a vile body on which to test a knowledge of styles and dates rather than the thing of beauty, and more importance is attached to the docketing and pigeon-holing of details than to getting a large and comprehensive grasp of the whole. It will be understood that I am only speaking suggestively; but I have no doubt whatever that it is too often forgotten that the building which is a masterpiece should be approached in the same way as the book which is a classic. Dr. Johnson has told us with convincing wisdom that the beauty and unity of a great conception should not be broken, or its thread interrupted, by a reference to the notes on a first reading:—"Notes are often necessary," he says, "but they are necessary evils. Let him that is yet unacquainted with the powers of Shakespeare, who desires to feel the highest pleasure that the drama can give, read every play from the first scene to the last with utter negligence of all his commentators. When his fancy is once on the wing, let it not stoop to correction or explanation . . . and when the pleasures of novelty have ceased, let him attempt exactness and read the commentators." I suppose the commentator in our case is, strictly speaking, the verger, whose mission it is to turn poetry into prose; but his mistake is shared by many in an unofficial way. I have been speaking of the mote in my brother's eye, but it does not follow that we have not a beam in our own; as a matter of fact, if not such sinners in our own persons, we must be held ultimately responsible for the shortcomings of others.

Let us hear what the oft-quoted Montaigne has to say on the subject:—"When I hear our architects," he says, "mouth out those big and rattling words of Pilasters, Architraves, Cornices, Frontispieces, Corinthian and Doric works and such-like fustian terms of theirs, I cannot let my wandering imagination from a sordaine apprehension of Apollidionius his pallace, and I find by effect that they are the seely and decayed pieces of my kitchen-dooere."

Montaigne was common sense personified, and gifted with that sort of perspicacity which makes his criticism valid for all time, and it is good for us to know how the hyper-professional attitude struck him, that seeming desire—if it is not a real one—to create a shibboleth, to make something of a trade secret of what is intelligible to any cultivated taste. But to look at the same failing in another aspect, I do not know what may be the experience of others, but I have frequently been confronted in the intelligent world of art with a feeling of resentment, not more at the rigid adherence of a modern building to an old model, when there was no special suitability to suggest it, than at its being deliberately labelled with the name and title of the type to which it conforms. For an architect to bind himself hand and foot to the rigid exercise of one style, no matter how varied the requirements he has to fulfil, if it is to cultivate dexterity at the sacrifice of the taste, judgment and discrimination which a more liberal appreciativeness or a less cautious attitude will keep in constant activity, is at least a course which has its merits and claims our respect, but for the same man to say, Now I am going to design in the Perpendicular style, now in the Jacobean, now in that of Henri Quatre; to work professedly under several recognised sets of conditions, adhering blindly to precedent in each, and

* W. Hazlitt.

following the model with academic scrupulousness—in a word to be on terms of distant acquaintance with all, and familiar with none—does, indeed, seem the way to quench the spirit and leave nothing but the dry bones for our delectation. “Warnut I says, and I ups and give it a twiddle this way;” it is nothing but the attitude of the shoddy wood-grainer writ large.

I take it that no self-respecting man is consciously satisfied with the paste and scissors method of design, however nearly he may approach it in actual practice. Even those who are least generously endowed by nature, or most conscious of their own deficiencies, feel that they have something within themselves which it would be a satisfaction to them to put into their work. Originality is a wide and vague term, but, at least, it conveys to most of us an idea sufficiently definite to admit of our aiming at it, and that it should be invariably made our object I do not doubt.

There seems to me absolutely nothing of real interest in a work which is simply free from solecisms and mistakes, in which all the virtues are negative, which is devoid of character and life in much the same way as the typical head which is produced by photographing one over another—where every feature is the mean between a variety of extremes. It is better to have fought and lost than never to have fought at all; it is better, vulgarly speaking, to have come an artistic cropper on one's own account, than to have skated about all one's life on the architectural ice leaning on the chair of convention.

I believe, then, that an independent and self-reliant attitude should be a condition precedent to all design, but I deprecate the encouragement of purely visionary aspirations for novelty. Only the other day I read in what should have been a sober publication, as it was an official one, a warm recommendation by one Frenchman of the following rhapsody by another—M. Vitet. “Never,” says the latter, “never in the world has an art been produced twice in the same guise; or, if it has, it was a mere trade the second time, and not an art. Honour to those who, even in our day, do not despair of inventing a new architecture. . . . Let them draw their inspiration, neither from the forms of antiquity, nor yet from those of the Middle Ages, but let them be impregnated with the sentiment of a master-thought—the thought of an artist, not an archæologist.”

There is a great fallacy in this aspiration to start with, and one which has been exposed before now, and that is the assumption that the intellects of a new cycle must always approach a problem from a new point of view. The real truth is that the same class of mind in any age will always approach a problem in the same way and arrive at kindred results. Signal novelties in thought,* we are told, are as limited as signal inventions in architectural construction, and *vice versa*. The Rousseau of the Social Contract and Emilius was, to take one example, in close touch with the Spartan Lyncurgus, or with the society which that name represents; his nature led him to approach a problem which he believed to be identical in a way which was identical actually. Classification, in a word, should not be made according to dates, but according to the nature of the thinkers, for that there should be a recurrence of ideas in similarly constituted thinking machines is at once natural and the fact. Again, to tell one to lay violent hands on a master-thought, unless it is someone else's, is about as reasonable as to tell one to inherit 10,000*l.* a year, or to suggest that one should become Archbishop of Canterbury; master-thoughts are not so easily come by, and still less if the master-thoughts of past generations are to be a dead letter to us; we must all too have been archæologists in our degree or we shall find when we sit down to the desk that the teeming visions of an exalted fancy are all too ethereal for the sober process of transmission to drawing paper.

In saying that the meaning of originality is generally understood, I am not blind to the various glosses which ignorance or self-conceit put upon it, nor in suggesting it as an aim do I mean that the young designer is to set it up consciously as a thing to be won. Originality is a subtle quality, a fresh and natural sense of fitness, which bears no forcing; which to strain after is to put beyond reach. It cannot exist in the design unless it has existed first in the designer, because it is in its real nature an unconscious expression of the artist's own personality; a form of self-realisation—his way of viewing a thing, his way of seeing the possibilities and meeting the necessities of a given case, and no one else's. Nature breaks the mould, as has often been said, when she forms the man: individuals may approach or touch each other at points, but never all along the line. Each is an original piece of work himself, and his natural product cannot be less so; unfortunately for us it is very easy to go the wrong way to work; and to dam up the flow of our natural tendencies, or to carry them into an artificial channel is the simplest thing in the world. This conscious craving to do something fresh, as formulated by M. Vitet, is almost fatal in itself, and the very air we breathe nowadays teaches us to be self-conscious and introspective: for better or worse, and mainly for worse, we have eaten of

the tree of knowledge of good and evil, and the charms of innocence and simplicity are not naturally inherent in anything we produce. Stendhal's autobiography or Marie Bashkirtscheff's diary are only extreme instances of a common complaint, and nothing opens the eyes more thoroughly to the difference between the conditions which govern our work and those under which the masterpieces of our great predecessors were produced than the comparison of such morbid outpourings as these with the breezy simplicity of Cellini's life of himself.

If any proof were wanted of the need of an intimate converseance with old work it would be found, I think, in the aid which it gives to facility in production, so that it is half unconscious; the tools, at least, are all to the craftsman's hand, and the thread of inspiration is not broken by petty interruptions. I do not like to think of limiting the scope of study in any way, but at the same time it seems clear that a man has been both better endowed by nature, and will be actually better equipped, whose preferences lead him to put definite bounds to the sphere of anything like exhaustive inquiry. In this connection I make no apology for quoting from an essay by Mr. John Morley on “Literature,” because literature is one of the fine arts, and the same critical faculty, if not the same productive, is concerned whether architecture or English prose are in question. Mr. Morley has been speaking of the lists of the best one hundred books with which we were flooded a few years ago, and he says:—“To fill a man with heterogeneous scraps, from the Mahabharata and the Sheking down to ‘Pickwick’ and White's ‘Selborne,’ may pass the time, but I cannot see how it would strengthen, instruct, or delight. . . . The steady working down of these lists would end in the manufacture of a prig.” Now, as Mr. Morley goes on to say, “a prig has been defined as an animal which has been over-fed for its size.” Priggishness in design is only too real a thing, and it is always marked by exaggerated self-consciousness; but I am far from suggesting that it is inevitable, even where the designer, like a quick-change artist, appears constantly in a fresh character. It is only a shocking possibility.

Before leaving Mr. Morley, I am tempted to make a further quotation, or series of quotations, which contain a truth quite as real for us as for the audience to whom they were addressed. “I have an unbounded faith,” he says, “in the virtue of cultivating direct and precise expression. It is not everybody who can command the mighty rhythm of the greatest masters of human speech, but everyone can make reasonably sure of what he means, and whether he had found the right word. . . . It has been said a million times that the foundation of right expression in speech or writing is sincerity. . . . Right expression is a part of character. . . .” And again, “Truth is quiet; moderation and judgment are, for most purposes, more than the flash and glitter even of genius.” I wish this were more generally recognised by the world at large for whom we have to cater. When we hear work qualified as original should we be right in assuming that it has been conceived and carried out in the spirit which Mr. Morley inculcates, or must we not rather confess to a conviction, born of long experience, that oddity is meant rather than originality, rhodomontade rather than direct expression? Some would say that in the appreciation of the public lies the justification for such work as this. I don't know whether one would naturally go to Addison for an opinion as to the principles which should govern art, but he had a judicial way of laying down the law on general questions, and this is what he says on the point:—“I shall add no more than that music, architecture and painting, as well as poetry and oratory, are to deduce their laws and rules from the general sense of mankind, and act from the principles of those arts themselves; or, in other words, the taste is not to conform to the art, but the art to the taste.” Of course, it is obvious that the fundamental principles of art were evolved by taste and have their basis in it, but not in that of the man in the street. Addison's language is not perfectly clear, but if he meant that the general direction of uncultivated likes and dislikes, at any given moment, is the proper criterion of what is radically good and bad, it is impossible to agree with him, nor does it appear that he contemplated the interference of the public in his own special domain. Mr. Louis Stevenson, writing of the fine arts generally, does, indeed, say that their *raison d'être* is to please the world at large, and that we have no business to try and make our customers buy wares they do not want, but he goes on to expatiate on the intrinsic faculty of the artist's work for conferring happiness on its creator, quite apart from any question of success. “In the wages of the life,” he says, “not the wages of the trade, lies the reward,” and again, “Man's (*i.e.* the artist's) joy may consist with perpetual failure and find exercise in continued chase.” Of the pleasure which his own work gives him he has spoken more than once; the public has the good taste to agree with him, but had it been otherwise, I, for one, decline to believe that he would have condescended to exchange his own reading of his art for a more ample measure of popularity.

To advise the young man to ignore altogether the necessity of getting his bread and cheese is, however, to offer a counsel

* J. Morley.

of perfection. The unflinching prophet of a higher taste or purer aims runs a greater risk of being left crying in the wilderness. Still the heretic of to-day may be canonised to-morrow; how often, indeed, has it happened that the laughing-stock of one generation has become the idol of the next? "Magna est veritas et prevalebit," but it is a question of time. "The books," says Lecky, "which have proved of the most enduring value have usually at first been only appreciated by a very few, and have only emerged into notoriety," as he oddly puts it, "after many years of eclipse." He continues in the following pregnant words:—"There are demagogues in literature as well as in politics; and there is a degradation of style, springing from a thirst of popularity, which is at least as bad as the pedantry of scholars." It is quite true, then, that what the mature judgment of the world ultimately approves is really great; this is the ultimate test: the prophet takes a higher place than the demagogue in the long run, for in this case second thoughts are best and most permanent, and the craze of the moment rarely deserves anything better than the oblivion which is in store for it.

Many a young designer has been infected by the spirit of Impressionism which is in the air. Amid many signs of talent and imaginativeness there is in the Impressionist school too obvious an addiction to novelty of effect for its own sake, though its hideousness may make it quite unworthy of reproduction. Flesh may look dirty to blackness under certain conditions, but there is no reason for so painting it. Still, here is work done on principle, with good intentions, and often with great suggestiveness, and we have no real right to quarrel with it. Speaking of Impressionism I am reminded of an instance, I am afraid somewhat beyond my subject, in which the principle was carried beyond drawing and design into execution, and in an odd way. The work in question was one of great charm, but I felt the presence of a great blot when my attention was arrested by odd and purposeless patches of brickwork and tiles spotted about, sometimes in wavy courses, on the general background of stone. At first I thought it a somewhat absurd affectation of taking any materials which were available at the moment, building from hand to mouth, so to speak, but afterwards I inclined to the idea that it had been done with the object of getting that indistinct and indeterminate effect so well conveyed in the clever draughtsmanship of to-day—which, as a matter of fact, a wall face does present, owing to the limitations of the human eye. The good sketcher only shows that he is, as fond mothers say of their children, "very noticing"; he is repeating a lesson which he has been alert enough to learn from nature. But the architect here tried to work back again from the reproduction, as if nature did not know her own business, and the result was to rivet the eye at once with an oddity, and to make one lament that a charming piece of work should be marred by a restless and conscious endeavour to be clever.

But if there are some who fly to excess on principle, there are others whose proceedings have not that excuse, who argue, seemingly, that as isolation is possible in the midst of a crowd, so it is possible to be original in company, to be somebody else and yet yourself, but I think that those who "convey" a startling feature, or a reminiscence of one from somebody else's work, with a vague idea that in thus showing their appreciativeness they participate to some extent in the credit of a piece of design, to which none may have been due in the first instance, become, as it were, accessories after the fact, simply pile Pelion upon Ossa in the reduplication of mistakes; the step from originality misunderstood to a veiled plagiarism may not be exactly that from the sublime to the ridiculous, but the pettiness and absurdity of the latter are incontestable. Nothing is more contagious, nothing more difficult to throw off, than this diseased itching for effect, a malady which even blinds the patient to the passing of that critical moment when what he fondly believes to be new has already become stale.

Its popularity is one of the baits which such work holds out; its comparative easiness is another. "To be intelligible," says our latter day La Bruyère, Mr. Oscar Wilde, "is to be found out," but to be unintelligible is either to have no meaning, or to be unable to express it. It has been well said that it is easier to be odd and enigmatical than to be sensible and simple.* It does not take much to collect a little gaping crowd in the street, nor is much thought nor much imaginative power requisite to provoke the attention of a people which is attracted by novelty, however crude. Before the young sailor launches his bark on the sea of architecture he must fill his ears with wax, or the soft tones of the siren of copyism will wheedle him to artistic destruction, and the more easily that he is not completely conscious of the danger he runs.

It ought to be enough to ask ourselves whether eccentricity has ever been a feature of any masterpiece, to avoid it like poison. In the whole sphere of art, is the finest work ever marked by that oddity which, like a joke, becomes positively wearisome directly it is familiar? Has it not rather something of the measured cadence and stately rhythm of one of Burke's

periods, let us say? The test of a work's merit is the degree to which it will bear living with. There is a brilliancy in decay and degradation, like the lights of a festering marshland; it leads its followers into strange and fatal paths, like a will-o'-the-wisp, but the spell is soon broken. Rococo work of any kind is like the bright talker, the paradox-monger, for ever on stilts, whom to meet is, after a little experience, to avoid: the quips and cranks of such work, the pieces of wayward cleverness, like the sharp sayings of a naughty child which amuse us in spite of ourselves, the conceits in which the designers displayed what Poe calls "the mad pride of intellectuality," are just what make it turn to ashes in the mouth.

Art is no art, as the old Latin tag tells us, unless she conceal herself to some purpose; she cannot, as her semblance so often does, plume and preen her feathers for our delight; we soon weary of seeing beauty attire herself. But there is a higher perfection than successful self-effacement, and that is sublime unconsciousness of the existence of an audience. "Suppose the *Venus of Medici*," said Diderot, "before you, and tell me if her nudity would offend you; but put on her feet a pair of dainty embroidered shoes; fasten to her knee with a rose-coloured garter a clinging white stocking, and the whole difference between the decent and the indecent will be apparent to you at once. It is the difference between the woman whose charms one sees and the one who displays them." The highest art, to my mind, is neither that which courts display nor that which wears a veil; but that which, like another Eve before the fall, knows no need of one, whose beauty is there without reserve, patent to all men if they have eyes to see, and so perfect in the harmony of all its parts that to know it familiarly is to light upon a fresh charm every day.

There is an old German story, of which there are many variants, of a certain charlatan who professed the highest skill in fresco-painting, and his art had this peculiar feature, which, of course, enhanced its monetary value, that it was invisible except to the eye of wisdom. Commissioned by some royal highness to decorate the walls of a saloon, the pseudo-painter went on interminably pawing the air with his brush; of course, neither king nor courtier could see what did not exist, but they were not the less lavish with their praise, and if a suspicion ever entered the mind of any one of them he had not the strength of mind to speak out, and run the risk of labelling himself uncultivated. The point of the fable is obvious enough, if not to our present purpose; but I think we may take the thief's qualification of his work as a scathing sarcasm on public taste, and the behaviour of the king and his court as an equally bitter commentary on the power of fashion, and the hollowness of much apparent appreciation. The highest art, after all, appeals to a comparatively small circle. Its beauties are as invisible to the uneducated eye as the frescoes of Owlenglass to his patron. Its very harmoniousness and unity give it a reticence unappreciable to those whose eyes are focussed for the brilliant and the garish; but, as I have already said, it is only a matter of time. No really great work has ever lacked recognition in the end, and if a man is to reach his highest level of production, it must be by working in accordance with the promptings of his conscience, and not by grasping at the shadow of popularity.

I pass on now to those, and they are not a few, who, in an exaggerated reliance on their own fertility of invention, are not content with simply being unlike other people, but spend their lives in the effort to be unlike themselves, who discard what circumstances suggest, or even what convenience dictates, merely because the solution bears a near resemblance to one already arrived at, of whose style you can predicate nothing with certainty, so successfully do they mask their predilections, so sedulously do they cultivate variety. Such instability, combined as it frequently is with great talent, seems to me perfectly inexcusable, not less so than a corresponding degree of moral irresponsibility would be. Just as you can assert with confidence the action of a friend, whose character is known to you, under given circumstances, so you ought to be able to recognise the artistic touch, the individual impress, of one with whose work you are familiar.

Cornelius O'Dowd said years ago that no man of really commanding intellect or strong character was ever to be looked for among those adepts at foreign languages who make them their own in so real a sense that their ideas, their way of looking at things, become those of the people whose language they are speaking, for that is what intimate converseance with a language means; such a power of adaptability shows consummate cleverness, but is something quite different from genius, both intellectually and morally. "Capacity rather relates to the quantity of knowledge; genius to its quality. Capacity is power over given ideas or combinations of ideas; genius is the power over those which are not given,"* and as with language, the power of absorbing various different styles, of straying without predilection over the whole field of design, and grasping all the little distinctive tricks and turns, which

* Hazlitt.

answer to the idioms of a language, is not a thing to aspire to, nor is it the mark of greatness in its possessor. Genius cannot be commanded, of course: in its intellectual aspect it offers a bare precipice of rock, the top of which no one can reach except on the wings of a divine imagination, but in so far as it is a moral quality we may and ought at least to gain its outworks.

If a man has any moral backbone, what he is once he is always; this is not the negation of freewill, since you cannot predicate either freewill or necessity of a non-moral, irresponsible being, nor is the recognition of a man's hall-mark on his work any sign of limitation in his powers; rather it denotes that he has a definite character and settled convictions—in other words, a style of his own; failing this impress his work may be original in a certain sense, but to the higher quality of individuality it can have no possible claim.

It is said that a judge must be told twice what you want him to understand, a special jury three times, a common jury six times, and I think, generally speaking, our attention bears directing with some persistency to what is good and worthy of being remembered, to some form in which its creator finds his most complete expression. It is satisfying to see the growth of the idea in the designer's brain, the process of evolution: this is how nature works, step by step, rung by rung, up the ladder of perfection, and art in its natural state—as it grows, not as it is manufactured—is in strict analogy with nature's processes. The history of our own art can be read in wood and stone, the embellishment of the traditional, the birth of a new inspiration from the ashes of an old one. But turn for a minute to contemporary work, to one of the most interesting and distinctive careers of our day, that of the late Mr. H. H. Richardson, of Boston. There was a man who, once satisfied that he had struck a happy vein, a fitting medium for self-realisation—and he was, like all artistic natures, sensitive and hard to satisfy—was not afraid of working it out, of filling afresh to-day from yesterday's well of inspiration, of playing new variations on an air which was already in the hands of the public, and yet I think I shall be only expressing the general opinion when I say that it would be difficult to find anything more instructive for the tyro in design, or much more delightful for anyone, than the series of libraries and railway stations, so obviously fathered by one man and yet so distinct from one another, for which he was responsible. Mere originality, as such, is simply swallowed up in the strong individuality of a man who, like a true artist, spent himself in the pursuit of perfection.

Production is always a pleasure, but the more complete the self-expression the higher and purer it is, though some never allow themselves the opportunity of making the discovery. Such a mode of work as Richardson's, turning neither to right or left, but advancing steadily along the road which his taste marked out for him, is not only the most moral in itself, but it is that which promotes most highly the welfare of art at large.

If a man arranges his wares like a tradesman to suit the taste of the moment, or if he is perversely determined to fly in the face of his own special talent, if he is for ever turning down byways in the mere restless craving for variety, or the desire to impress his public with a versatility which they do not suspect, he will be selfishly sacrificing his art to himself, and will have no one but himself to blame if his vogue quickly passes. To do a popular piece of work rather than a good one is to offer up the future on the altar of the present, to eat up your capital instead of living on the interest. You will make a greater show at the moment, but you will not cut up so well in the event.

The game of art is like the game of cricket: the cricketer may keep his own average or his analysis in his mind's eye, of course, but, primarily, he has to play for his side, and may be called upon to make a sacrifice. Unselfishness in both cases is little less to be cultivated than actual skill, and the true artist will be ready to sink himself in the spirit which is the mark of true sportsmanship.

If, then, I am not disposed to deduct one jot from my esteem of a man who turns again with fresh zest to his own imaginings, I am no more inclined to quarrel with those in whom lies the power—the sign and seal, this, of greatness—to make everything their own on which their hand falls. I say boldly that the great artist cannot plagiarise from his insignificant brother, however largely he may draw on him for material. The medium of expression is a matter of comparatively small importance, but it is quite as possible to be original in the treatment of an old theme as in striking out a new one. D'Artagnan existed in real life before Dumas made a demi-god of him; Handel laid violent hands on a thirteenth-century French air, and transformed it into the "Harmonious Blacksmith." Yet who would be so absurd as to give two thoughts to its origin? There may be some who, in the spirit of Carlyle's Dryasdust, follow up the mighty river of Shakespeare's creations to a fountain-head in Plutarch, or tax Burus with having founded his "Cotter's Saturday Night" on Ferguson, or his Epistles on Ramsay, but to what purpose are such criticisms unless it is to show to what pettiness the critic's craft at times

obliges him to descend? So far as regards the subject of their animadversions they may be summarily put aside. To put the warm breath of life into Pygmalion's cold marble, that is what genius does to the subject matter which it usurps. How little the strong man feels the indignity of borrowing may be instanced by Richardson's proceedings in the case of his design for Trinity Church, Boston. Mrs. Van Rensselaer, in her interesting account of him, tells us how he cast about, for some time in vain, for a motif for the central tower of the church, till he happened to come across a photograph of the lantern of the old cathedral of Salamanca. He saw his opportunity at once, and, bold as he was in presuming to treat so fine a conception as his raw material, he justified his action by the result. His own impress is nowhere more perceptible than it is in that tower, and yet it is still Salamanca, just as Salamanca is at once itself and Vendôme.

The author of the "Bible in Spain" has given us in his delightful book, "Lavengro," a view of the other side of the question, in his representation of the author whose mania for what he understands as originality leads him to distrust the very breezes for fear they should whisper something which the inspiration has already suggested, and so make it valueless. He cribs, cabins, and confines himself in the attempt to say nothing which has ever been hinted at before. His imagination chafes at the bit, but he curbs it in remorselessly, and if he did not succeed in turning a mettled courser into a common hack, it was because the scales fell from his eyes before it was too late. This is the *reductio ad absurdum* of the foolish purism which has its foundation in selfishness, and is as little to be admired as are the arts of the plagiarist.

But the master mind will turn men to its own purpose as readily as their ideas. It has been said, I believe, that if Bach had devoted every minute of his time to composition, he could hardly have produced the volume of work which not only is his in name, but is indisputably so in character. Everyone knows, again, though no one can quite understand the manner of it, that the elder Dumas was the presiding genius, in every sense of the word, of a colossal literary manufactory, the Vulcan in an intellectual smithy, from which a stupendous amount of work, good, bad and indifferent, was turned out, in which much was very good, little was wholly bad, and all was individual. He had his detractors, of course, gentlemen whose superior sharpness enabled them to credit the various ghosts with most of the merit of the work, but such a contention was absurd on the face of it: the books which I hope many of us have found time to read are the work of one man, whoever he was, and the mediocrity of even the best of his workmen—such as M. Maquet—when left to their own devices shows that that man was Dumas. It is an old, old story, a serial that will run till the crack of doom. Perugino's saintly Madonnas and adoring attendants, in which the personal equation seems to go for so much, were turned out by the gross, as Professor Symonds has told us. But, to revert once again to Richardson, whose manner of work is, after all, more immediately interesting to us, nothing could illustrate more completely what I have said than his practice. This is not the occasion to discuss whether his attitude towards those he employed was generally better for their artistic training than the more usual one or not, but so suggestive was he, so subtly did he work on his assistants by hint and criticism, rather than by direct illustration of his meaning or his wishes, that they appear themselves hardly to be able to tell us how they were made to carry out his ideas; yet he was in his way as individual as Dumas, and his death has displayed little less cruelly than that of the great novelist, how paramount that influence was which was kept so consistently in the background, how veritably the divine spark which illumined his work was in him and in no one else.

I suppose I need not trouble myself to sound a note of warning. It is obvious enough that so masterful an appropriation of other people's goods is not for all; indeed, it is for very few. Most of us are fitted by nature to play the part of the tool in the master-hand rather than that of the master-hand itself, and if we meddle with other men's work in the ambition of absorbing it and making it our own, we shall probably find that it is too strong for us, and that, instead of the dog wagging the tail, the tail is wagging the dog. To foster copyism for a moment is fatal; for, if we do so, we may find that, like another Frankenstein, we have reared a monster too strong to subdue.

I conclude by addressing a few words to the younger among my audience. You will have gathered, and, indeed, it hardly needs the telling, that originality in the highest sense of the word, or individuality—for the two are practically synonymous—is not a thing which can be commanded. But the humblest of us have something to express which may be of interest without shaking the foundations of the world, and if we have not the power or the will to approach our work freshly, to rely frankly on our own inspiration, or the results of our own thought, then architecture was not meant for us, nor we for architecture. Mere bookwork, mere accurate reproduction and formal arrangement of traditional forms is hardly worthy of the name of architecture; it is a mechanical process, devoid of all vitality, and can

give no real pleasure to the producer any more than to the consumer. But, taking it for granted that your natural endowments are not so limited as this, I ask you to try to approach your problem as if it had never been solved before. Do not think of precedent for the moment, either to adhere to it slavishly, which is folly, or to outrage it, which is insanity, but consider the special circumstances in which you are placed, without reflecting that they are usual enough, the requirements which you are bound to fulfil, and the effects you are going to produce, in pure unshackled self-reliance. Your training will stop you short of the commission of an absurdity, your intelligence will tell you when the general consensus of opinion has laid down certain laws either for the provision of comfort or for the satisfaction of taste, which are, so to speak, immutable and must be abided by, but it will tell you, in the same breath, that tradition is not everything; that the brain of humanity is busy devising fresh tools for your hand every day; that there is such a thing as running in a groove from a simple unquestioning acceptance of things as they are, when the circumstances which dictated the particular course may have long changed. It reminds me of the story of the sentry whose charge was a grass plot in the neighbourhood of the Winter Palace at St. Petersburg. One day the Emperor, who had seen a sentry on duty there a thousand times without giving it a second thought, happened to ask what particular duty the man was fulfilling, or why he was there. No one knew, till the oldest inhabitant, or even perhaps some musty record, revealed the fact that a reign or two previous a soldier had been placed there one day to prevent a crocus from being picked. We must assume that the crocus had died in the interval, but still officialism clung heroically to tradition, and that is exactly what the less imaginative minds among us are in danger of doing. Think everything out and accept nothing without question. Originality, believe me, is not necessarily spontaneous in character; it lies just as much in thinking out as in rapid conception, in labour as in impulse, and it must belong to the essential form of your work, be really part and parcel of it, not be thrown over it at the last moment like drapery over a lay figure.

If the question is put why have you done so and so, a sound reason should always be forthcoming. This is a somewhat severe test, but a genuine one, and is more likely to be passed successfully if your originality starts with the first thought you give your subject, coexists with its first formulation, and consists not so much in the treatment of a feature as in its presence. I say, think everything out for yourselves. To ignore tradition is like sitting down to write on a well-known subject without having made yourself master of the literature which bears on it, but if our education to-day bears fruit, the young designer will carry much of the lore of his subject in his brain in a more portable and infinitely more useful form than that of books, because it has passed out of the sphere of the mechanical into that of the instinctive. Perhaps I may illustrate the value of looking at things with a fresh eye by a short quotation from some remarks made by Mr. W. B. Richmond before the Art-workers' Guild a year or two ago.

"Why do you architects," he said, "in all, or most, instances make the windows of every sitting-room in a London street to come down to the ground, or nearly so? I have often looked up at that dark strip of wall above the three windows of a London drawing-room, and on the wall between the windows, where, usually, a looking-glass is placed, because nothing else would be visible; and I have wondered why someone does not make one long window the whole width of the room, right up to the cornice, and about 5 feet from the ground, divided by three brick piers, on which might be placed, on the inside, beaten metal-work after the design of a pilaster: the same treatment might be adopted for a dining-room, and would be especially valuable in a library," and so forth.

I suppose Mr. Richmond hardly intends to make architects responsible for the ordinary London house, and I do not mention the particular suggestion as being quite novel; but it serves to indicate the frame of mind in which the most time-honoured situation, treated a thousand times in the same way, should still be approached on the thousand-and-first occasion.

The late Master of Trinity College, Cambridge, once said, in his quietly sarcastic way, "We are all liable to be mistaken at times, even the youngest of us." To be cocksure is, indeed, the happy privilege of youth, as are enthusiasm and many other pleasant qualities in which chill old age would be only too glad to participate, but I ask you to remember that even amongst the most highly-gifted, or perhaps I should say, especially among the highly gifted, during the period in which the artistic character is being formed, self-reliance should be tempered with self-restraint; eccentricities may be perpetrated under a sudden impulse which please their author at the time because they express his mood, but when one is older and wiser, or at least more circumspect, it is pleasanter not to have the indiscretions of an ill-disciplined youth standing there in all the durability of

brick and stone to point an untiring finger of derision at one.

A vote of thanks was passed to Mr. Street for his paper as proposed by Mr. Millard, seconded by Mr. Mountford and supported by Mr. Woodthorpe and Mr. Hooper.

THE WOODS AND THE ARCHITECTURE OF BATH.

IN a lecture at the Bath Institution on "The Two Woods and the Bath Renaissance," Mr. R. E. Peach began by referring to the difficulties placed in the way of the Woods by the grasping nature of the owners of the land, and the patience and sagacity needed to overcome these. One of the earliest and grandest conceptions entertained by Wood—in 1726, the year before he settled in the city—was a street to be called Berton or Barton Street. It was to have been 1,025 feet long by 50 feet in width, but for various reasons this intention was abandoned, a resolution which they had no reason to regret, seeing the direction it was to have taken from Old King Street, and how it must have changed the whole course of subsequent operations. One great difficulty in the early part of his career was to get experienced masons, joiners and carpenters, all of whom he employed from London. Amid many arduous undertakings apart from his grand building schemes, was canalising the Avon between Bath and Bristol, in 1727, earlier attempts at which had failed. He was employed upon the work by the Duke of Chandos, for whom, about that period, Wood built Chandos Court, as it was called, and restored St. John's Hospital. One of the most interesting, as well as important, historical institutions with which Wood was connected was the Royal Mineral Water Hospital. They were accustomed to think of this noble institution as having its origin in the benevolent instincts and conceptions of Beau Nash—a total misconception. The hospital, so far as it owed its existence to any one man, owed it to Wood. Two old houses, some outhouses and the old theatre, built in 1705—plays in which were rendered illegal by the Act just then passed—were acquired, cleared and prepared for the building, the first stone of which was laid on July 6, 1728, and the hospital was opened May 18, 1742. For all his labours and professional services at the hospital Wood charged nothing. The work they all admired, and further, they admired the good taste of the architect to whom the task was given of enlarging the building, in not departing from the style of his eminent predecessor. The lecturer said it would be scarcely worth his while to occupy much time in describing at length the minor works of Wood beyond the precincts of Bath. In 1748 he built that exquisite house at the end of the sloping avenue at Bathford; he also erected the Shockerwick mansion, but it was not mentioned in his book for the obvious reason that it was built subsequent to the publication of the work. In the later structure no decadence in the architect's peculiar genius and executive power was to be observed; on the contrary, the edifice seemed to present in a marked degree all the excellence and characteristic sweetness by which the greater part of his creations were distinguished. There was one thing, however, which Wood certainly could not do, and yet with the perversity and self-delusion which sometimes misled great men, it was precisely a work in which he thought himself pre-eminent, and that was building a church. He wanted to build St. Michael's, the predecessor of the present, an edifice entrusted to a man named Harvey, whose production would have disgraced a village mason, both as to style and insecurity. Wood, as a rival, built St. Mary's Chapel, in Queen Square, a structure eminently adapted to the music-hall style of edifice. On entering it one felt an unholy desire to "light up" and call for a "drink." One redeeming feature it possessed, and that was the portico, which was a tetrastyle of admirable proportions. This part of the structure was still preserved, and might yet adorn an edifice worthy of it. Having referred to Wood's decease in 1754, and his burial at Swanswick, the lecturer said it might be assumed that some of the streets and buildings were in contemplation before his death, although a considerable interval elapsed between that event and the beginning and completion of the buildings with which Wood's name was associated. The circus was some years in course of erection, but it was quite clear that in the plan of that sumptuous pile many of the streets were contemplated which were not begun until some years after. In 1762 the circus was two-thirds completed, and he had reason to believe the work was finished in 1764. Simultaneously with this, however, another undertaking was going on—the erection of the York House, or, as the pile was called, York Buildings. Architecturally there was little to be said about the York House. Wood was hampered by two conditions, namely, to get as much room as possible inside, while leaving the largest amount of space outside. Still, he dealt internally with the house with his accustomed skill and success, and the building in the coaching days was one of the most famous hostleries on

the road. Brock Street followed the circus in 1765, and was finished in the following year, the chapel being erected by Wood in 1773. They had in the latter an illustration of Wood II.'s incapacity to build an ecclesiastical edifice. In Woolley Church there was precisely the same incongruity, the same apparent incapacity of the architect to conceive any higher ideal of a place of worship than room and comfort, both, no doubt, important, both, however, attainable with all the higher attributes of a Christian temple. There were many who would be inclined, and perhaps rightly so, to regard the Royal Crescent as the *chef d'œuvre* of Wood II. Personally, however, he ventured to proclaim the Assembly Rooms as his masterpiece. The former was begun in 1767, two years before the latter. In these two great works they had the most notable example of this eminent architect's discernment and self-restraint. In building these thirty mansions he saw precisely what was the most fitting in form, in style and character. The elevation was one of unbroken uniformity, although, from the architectural requirements, the bedrooms did not meet the wants of the present day. There was one peculiarity of this grand range of mansions which he might point out. It would be perceived that the architect adhered to the simplicity which was compatible with Classic grandeur, and that he carefully avoided meretricious surface ornamentation. The windows and doors were simplicity itself, and the effect of the whole was produced and maintained by the perfect line of beauty. In building the Assembly Rooms, now 120 years ago, Wood showed his power, his foresight and refinement: power, in adapting a difficult site to the great purpose in hand; foresight, in his plan which was to meet the changes and accidents of time; refinement, in the shape and exquisite adaptability of the various rooms and their harmonious grouping and relation to each other. If he had been a vain man he might have bestowed his ingenuity on grand external crockets and ornamentation, but he not only understood that the duty imposed upon him related to external distinction and beauty, but also that in carrying out the work in this spirit this great man was rearing a monument to his own professional memory. Still these rooms defied rivalry, still they might travel far and wide and exclaim that no such rooms were to be seen in the length and breadth of the land.

RESTORATION IN SCOTLAND.

THE discussion on the presidential address by Mr. W. W. Robertson, of H.M. Board of Works, on "Our Duty in respect of Ancient Buildings," which we published last week, was opened at the Edinburgh Architectural Association by Dr. R. Rowand Anderson. He stated that his views were diametrically opposed to those of the President. He contended that they were not entitled to stop the history of a building, say, at the Perpendicular period or any other period. The history should be allowed to go on, and the fittings and furniture that marked these periods should be allowed to remain. Dr. Anderson proceeded to examine the illustrations Mr. Robertson gave in support of his views. With his remarks about the removal of the Tron Church, and the retention of the Royal Exchange as the official home of the municipality he entirely agreed. It was to be devoutly hoped that the civic authorities would not desert their present building. It occupied a magnificent and central site, and it possessed all the merits Mr. Robertson credited it with. In addition, it represented a time when they had a vernacular architecture, and if he read the signs of the times aright they were likely to abandon it, using many of the restless and effete phases of art in place of the restful and dignified and common-sense architecture of that period. With regard to buildings which were in use, our life and comfort depended on keeping them in a state of repair, and that implied changing them more or less from time to time as views of comfort and civilisation and everything else changed. With regard to buildings in a ruinous condition, he maintained that if the building was capable of being utilised there was no other way of preserving it except by using it, and that involved that it must be subjected to all the changing phases of the time and the necessities of the case. If buildings were to be restored for the simple purpose of showing the original design, he was not prepared to condemn that view of restoration, but if a building was to be restored for use, he held that the architect, while jealously preserving all that was old, had to meet the purpose to which the building was to be devoted, even if thereby he had to depart from the original plan and make additions that did not conform to the original style or design of the building. Although he was not prepared to carry this view to too great detail, he thought they should follow the example of the builders of old. He instanced the case in which he had been concerned of the restoration of the cathedral buildings at Dunblane. Through that restoration the cathedral would be handed on to future generations, and that would not have been

the case if the building had been left in the ruinous condition in which it was some years ago. He admitted that from a pictorial point of view much of what the painter might see in it had not been left, but he maintained that buildings were not erected to make picturesque studies for painters. Old Dunblane Cathedral, he contended, was still there, and he had repaired only where structurally necessary; otherwise they would have had a ruin tending to further ruin.

Mr. G. S. Aitken followed in general the views expressed by Dr. Anderson as to restoration, and indicated the view that sentiment should not be allowed to stand too much in the way of restoration. As to the Edinburgh Municipal Buildings, however, he questioned what influence for good these had upon the citizens of Edinburgh.

Mr. S. H. Capper argued that the view of restoration must depend on the state of the case. If the building was a museum specimen, let it remain *in statu quo*. If it could be used, let them make the highest use of it; and he maintained that Dunblane Cathedral gained by its nineteenth-century work.

Mr. Thos. Ross argued in favour of restoration where admissible. The admiration for ruins as such was, he said, quite a modern craze, and the men of the Middle Ages showed by their practice that they had no such idea as the President enunciated.

Mr. James Bruce, W.S., spoke of the case of national buildings put to misuse, and he instanced the Castle Hall at Stirling, now turned into barracks.

Mr. Robertson, in replying to the discussion, maintained that the preservation of an ancient building, always supposing that it was worthy of preservation, should take precedence over every other consideration. With regard to restoration as a means of preservation, he had not a single word to say against it. It was restoration of a different sort that he had tried to condemn most absolutely. If restoration was to be carried on with the main view of preserving everything that was valuable in the building, and if that was put before everything else, he thought that such restoration was in every way desirable.

MEASURING EXTRAS.

ANOTHER case in which the prescribed charges of the Royal Institute of British Architects were irreverently treated as waste-paper by a judge was heard at Nottingham last week. According to the *Evening Post*, Mr. George Edward Statham, architect, sued Mr. Alfred Axe, builder, Derby, for 12% for professional services in connection with a contract for alterations and additions to a house in Derbyshire.

The plaintiff stated that he was employed by the defendant in the year 1891 to prepare plans for the alterations. A contract for 1,150% was prepared, but the total amounted to 1,497% 14s., for which witness certified, and upon which he was paid his commission by the owner of the property. That amount included 12% for measuring up the extras, and he had charged his commission on that in the general account. In cross-examination he said that was the 12% he was now demanding in accordance with the invariable custom of the profession. The defendant refused to pay him, and he could not distinctly say that the defendant promised to pay that particular amount.

Mr. Goodall, architect, Nottingham, gave evidence in support of the plaintiff's contention as to the custom of the profession.

Mr. Daly said he intended calling the defendant to deny the alleged custom, and to deny any agreement on his part to pay the amount claimed.

His Honour did not think it necessary for Mr. Daly to call any evidence, and proceeded to give judgment.

The judge said this was an action by an architect employed in a professional and fiduciary character to prepare quantities in connection with a contract. Extras were added to the contract, amounting in the whole to 450%. The architect gave his final certificate for 1,497% 14s., and included in his charges 12%, the cost of measuring extras. The plaintiff endeavoured to establish his claim by reference to a rule of the Royal Institute of British Architects, which excluded from the scale the 5 per cent. or the 2½ per cent., as the case might be, charged for measurements. He (His Honour) should imagine that an architect was entitled to make an extra charge, but such a charge as that could not be allowed, and even if customary could not be supported in any court of law. In the first place the plaintiff actually increased his client's bill by that 12%, and charged him commission on it. That clearly showed that the architect who made a charge such as that had an interest adverse to that of his client, and upon that point alone it was quite impossible that the plaintiff should be allowed by equity of common law to recover any such charge. He was sorry to hear that it was the custom of architects to make such a charge as that. He was quite sure no court, either in law or

equity, could uphold it. He non-suited the plaintiff. His Honour added that he did not make his observations so strongly as he wished, but he must point out the fact that the account sent to the customer carefully omitted any allusion to the 12 $\frac{1}{2}$ per cent. commission, and Mr. Statham himself very fairly said that his client would be under the impression that 5 per cent. commission was all he got. If there was any such practice in the profession it was a dishonest custom, and one he should not allow to be sustained in that court, nor did he think any other court would allow it.

Mr. Daly applied for costs.

His Honour, in granting the application, said it was, no doubt, an important question. He altered his decision to a verdict for the defendant with costs.

STAFFORDSHIRE TECHNICAL SCHOOL.

THE Technical Education Committee of the County Council have invited Staffordshire architects to submit plans for the offices, classrooms and laboratories the committee intend to erect on the site they have purchased from the Corporation of Stafford, in Victoria Square. The designers are to show two frontages—one to Victoria Square, with part to Cherry Street on the south, and the other to Earl Street on the west. Several existing buildings will have to be demolished, and the new building is to be of a substantial character and fireproof. The accommodation to be provided is to comprise four rooms for offices, varying in size from 20 feet by 18 feet to 14 feet by 12 feet; an educational library and a committee-room, 26 feet by 18 feet, but the designers are not limited to shape or even size, the figures merely indicating the amount of space required. Provision is to be made for a chemistry classroom, a science classroom, a teaching laboratory, and four rooms for apparatus, balance-room, and two small laboratories; for an art classroom and an art-room for modelling, and for a cookery kitchen and classroom. The building will also include a residence for the director, with a dining-room, two bedrooms and study, bath-room, &c., and also a caretaker's house near the same. Storage accommodation is to be provided, and space for the agricultural sub-committee's travelling dairy van and dairy appliances for cookery utensils, stoves, &c. Space is also to be found, if possible, for a museum of sanitary appliances, with an area of not less than 1,000 square feet. The plans are to be sent in by April 8.

THE ESCURIAL.

A PAPER left by the late Mr. Theodore Child on "The Escorial" appears in *Harper's Magazine*. The writer says:—The first impression made by the Escorial is its immensity, and the last its melancholy. There is no getting away from the place. It nearly fills the little town of Escorial, for naturally a monument built in the shape of a gridiron to recall the instrument of torture on which St. Laurence suffered martyrdom is rather straggling. The immensity of it takes your breath away; it is not a palace but a cyclopean town, and although the sun may be shining brilliantly, it looks sad and funereal with its grey walls picked out with staring joints of white mortar, its leaden roofs, its granite-paved surroundings, its volcanic aspect. This impression of something burned, blasted, plutonian, of something that has passed through raging fire, struck me time after time as I looked upon the structure. Nor is this idea of fire inappropriate. The palace-convent itself is built in the form of a gridiron turned upside down, and that in memory of the patron San Lorenzo, who was broiled by Valerian on a slow fire, and according to Prudentius, bore his martyrdom with coolness and even jocose irony, for when one side was roasted he had himself turned, and invited his cooks to try whether he tasted better underdone or well done. . . . The surface occupied by the edifice is 39,000 square metres; the exterior façades measure more than 800 metres and are pierced by 15 doors and 1,128 windows; in the interior there are 16 courtyards, 86 staircases, 88 fountains, 9 towers and 4,565 rooms; in the whole edifice there are more than 10,000 windows and 2,000 doors, while the lobbies, cloisters and courtyards measure in length some 75 miles.

The chamber of its founder, Philip II., is thus described:—With a chill of mysterious terror you pass through a low door, and find yourself in a simple room, with a tiled floor and bare whitewashed walls, relieved at their base by the usual blue and white tiles. The room is lighted by three small windows glazed with old rough glass, through which may be seen vast landscapes of dark verdure and grand mountain silhouettes, which prove that the morose king was not so ill-advised as some writers state when he chose the site of his cloistered palace. This is the room where Philip II. lived in monastic simplicity, and boasted that from the foot of his mountain he governed the Old World and the New with 2 inches of paper. The carpet of matting, interwoven with gold, and with

the double-headed Imperial eagle in red, is now hung up against the wall, and the red tiles of the floor are bare. Here is the table where Philip used to sit and annotate State papers; here are his portfolio, his inkstand, his set of pigeon-holes; here is the smaller table of his secretary, Antonio Perez; here is a miserable armchair, studded with brass nails, and with a leather back stitched into checkers. On this chair the king used to sit; and on these two stools, with their cushions of greenish-brown velvet—the one stool bearing still traces of red lacquer, the other of black wood bound with silver—His Majesty rested his ulcered legs. In the alcove to the right the great monarch slept on a bed doubtless as vulgar and even sordid as the chairs and tables of his sitting-room. Next to the alcove is a dark oratory, with walls of polished and panelled jasper. Touch a spring the panels open, and reveal the grand altar of the church; and on the opposite side, in gilt bronze, the group of Charles V., kneeling in eternal prayer, with the women of his house beside him. In this narrow oratory Philip, in 1588, took to his bed suffering tortures, his body devoured by sores, wasting away literally like Job upon his dung-heap. Through these narrow openings in the jasper panels, with which the irreverent fingers of curious tourists now play, the monarch, worn out with care and sickness, peered with anxious eyes as the priest celebrated mass amidst the splendour of the *capilla mayor*. Here, in this narrow, dark and close corner he died. An inscription on the wall records the graphic summary of his end:—"In this narrow chamber died Philip II. when the world was too small to contain the son of Charles V. He lived so far from the earth that his soul alone was living; of his body there remained but the shadow when he finished dying."

The Future of Architecture.

SIR,—I will now, with your permission, attempt to define what is necessary to bring back vitality to British architecture, for, as I said before, to be deserving of the name it must not be a stale copy of a past and defunct style. Though originality is my theme, no originality on my part is required, for the subject has been long ago well worked by such men, to go no further back, as Fergusson, Memes and Wyatt. I may therefore put what I have to say in the briefest language.

Architecture possesses an individual organisation, has its own particular and distinct province, and has its character impressed upon it by nature. Science is ever present. The basis of the art rests upon practical considerations quite as much as upon those of beauty, with the result upon the spectator of the strongest impressions of sublimity which it is in the power of any of the arts to produce. There is a tendency to create specific variety of form the moment the imagination is excited; hence the origin of past and differing styles. Every race, in building temples to God and monuments to man, struck out something different to all the rest. But there were two principles ever co-existent—the one permanent and common, the other fluctuating with surrounding change of circumstances, and creating evolution and development—style. In all ages the materials employed in architecture have exercised a most potential voice over its form and character. The law, however, which determines their arrangement is universal, arising from exigencies over which taste or ingenuity exert only limited control. Imagination comes in contact with reality at every step. Beauty becomes here not the creation of phantasy, but the creation of science. Hence perfect architectural beauty is the most sublime and the most rational of objects of taste; for, while the susceptibilities of the mind are awakened, the powers of the judgment are gratified by the certainty with which the sources of pleasure can be traced. We feel the arrangement to be beautiful: we know that it is necessary. Thus the Egyptians and the Greeks rightly placed this study of materials first in order of all those which must engage the architect's attention; and perhaps herein is our salvation—the origin of a new and vital modern architecture.

Certainly, to my mind—and I have thought much about it—nothing would improve the urban architecture of our day more than substituting for the use of such dangerous and costly materials as Portland and other limestones in the fuliginous climate of London the custom of the Egyptians in the use of that noble material, granite. It exists in abundance in the United Kingdom. Machinery has been invented for its economic conversion, so that, if properly used, it is no more costly than elaborate freestone. Its beautiful tints range from pink to rose, French grey to slate, bright green to bronze, and from white to black. It is of everlasting durability. Smoke

and rain have no effect upon it. The chief difficulty would be the designing of an artistic treatment, in which two or more of its hues were made to combine harmoniously with great simplicity of moulding. HERMES.

Glasgow—Past and Present.

SIR,—A new broom sweeps clean. Mr. Newbery, of the Glasgow School of Art, is a comparatively new knight of the brush in Glasgow, and his critical and artistic eye has been recently taking, as it were, a clean sweep of the architecture of that city.

It seems that when the Macaw-lay New Zealander visits us he will, in the second city, find nothing worthy of his sketch-book except the Gothic cathedral of Sanct Mungo. Sir Walter Scott says:—

If thou wouldst view fair Melrose aright,
Go visit it by the pale moonlight.

And it may be that the pale, cold, reflected light of the melancholy moon may help the tricks of strong imagination to see in some Gothic structures vague and insubstantial beauties—the vision of a fabric (not “fabric of a vision”)—that melt into air, into thin air, beneath the beams of the “one eye that vieweth all the world.” But neither beneath the glimpses of the moon nor under the steady shining of the sun does Glasgow Cathedral, in at least the south front—that which is most exposed to view, the front which is chiefly seen by those tourists who flock to stare at the stained-glass windows as they do to gaze on the marble prettinesses of the Municipal Buildings—show any of that picturesqueness of composition which so eminently characterises the great Gothic works of England and the European continent. The sky-line is as horizontal as is that of a Greek cornice, the general effect being that of a big box with a great wedge driven through it from below at about the centre. There is no “breaking-up” by pinnacles or transept—although an abortive transept was strangled in its birth—and the projection of the buttresses is too slight to give depth of shadow. The only pretension that this front ever had to picturesqueness was before the gutty steeple and the consistory house were destroyed some years ago, “the craftsmen” of these enlightened days not rising to the defence as did those of the Dark Ages. And with this destruction the west front was also curtailed of its fair proportion, and left about as weak as was Samson after he had had his locks shorn. Besides, our boasted Gothic patriotism and Presbyterianism quietly submitted to have the wee Scottish lion dethroned from the apex and a prelatial crucifix elevated instead to the coign of vantage. The north-east is the only prospect of the cathedral in which there is much of picturesque composition; but this is not the view sought or seen by the stranger, unless he be an architect, a critic, or an antiquary. One of our own citizens, the late A. D. Robertson, who was as familiar as most with all the outs and ins of the venerable fane, saw with the keen eye of an artist in this grouping, as seen from the Firpark necropolis, the possibilities of a picture. The “possibilities” were in the corner. In a most masterly indian-ink picture the “long-drawn aisle,” &c., were drawn well towards the vanishing point.

The interior, however, of the cathedral is exceedingly fine both in general effect and in parts, the nave and choir being lofty, with their width well related to the height, while repetitive parts are almost as rhythmical as if they had in some wise been favoured by the spirit passing over them that in distant climes and times had moulded into other forms subordinate features of some Classic temple.

It is often complained of public buildings that they are so “cabin’d, cribb’d, confin’d, bound in,” that they cannot be seen in all their proportions; other buildings so press upon them that they can be seen in only part and parcel; but the site of Glasgow Cathedral is “as broad and general as the casing air,” affording the most ample opportunity for beauties and defects being easily seen, examined and criticised, an isolation that keeps at a respectful distance all objects unworthy of assisting its fair square outline in the composition of a picture. With the Hie Kirk, as with Hamlet, “the time is out of joint”; its old and picturesque surroundings have been improved, and its new are so “up to date” as to be incongruous and unsympathetic.

The cathedral has been long with us, and as Dr. Johnson says, “antiquity, like every other quality that attracts the notice of mankind, has undoubtedly votaries that reverence it, not from reason but from prejudice.” But towards the “high top, bald with dry antiquity,” there may be not only reverence but love. However, as the old critic adds, “all perhaps are more willing to honour past than present excellence; and the mind contemplates genius through the shades of age as the eye surveys the sun through artificial opacity. The great contention of criticism is to find the faults of the moderns and the beauties of the ancients.”

Whether Diogenes would have been more successful in his broad daylight search for an honest man if he had left his

lanthorn, lit or unlit, in his domiciliary tub, or whether Mr. Peter Quince, as carpenter, stage-managed to bring moonlight and wail into the scene in the wood near Athens, we know not. We may, however, perhaps be able to see in Glasgow, by the unaided light of the god of day, other buildings than our cathedral that may be worthy of being sketched by the future New Zealander—the portico of the Royal Exchange, by Hamilton; the Wilson Street front of the County Buildings, by Clarke & Bell; the portico and arches of the Royal Bank, by Elliot; the steeple of St. George’s Church, by Starke; the façade of the Commercial Bank, by Rhind; the porticos of Caledonian Road and St. Vincent Street churches, by Greek Thomson, and his exquisite detail of ornament, unrivalled in its power and beauty, its originality, and its adaptation to purpose; and to these might be added Jamaica Street bridge, were it not that as beauty and utility seemingly nowadays cannot coexist, the latter, the more powerful, has doomed this grand work of Telford—no less an architectural than engineering—to early destruction.

Two stars keep not their motion in one sphere,
Nor can Glasgow brook a double reign
Of beauteous bridge and hideous viaduct.

To descend from public buildings, there are such warehouses as at Madeira Court, by Burnet, and at corner of Nelson Street and Trongate, by Rothead; and as regards dwelling-houses, from those “where merchants most do congregate,” the West-end Park Buildings, by Charles Wilson, to those that are distinguished as so many rooms-and-kitchen tenements in Eglinton Street, by Greek Thomson, perhaps Glasgow cannot be surpassed by any city in the empire. It will be understood, of course, that as we have no nobility we have no “palaces.”

It is not easy to suppose what the New Zealander may do when he honours us with his presence, but, in the words of an author already quoted, “the irregular combination of fanciful invention may delight awhile by that novelty of which the common satiety of life sends us all in quest; but the pleasures of sudden wonder are soon exhausted, and the mind can only repose on the stability of truth”—and perhaps “truth” may be found in those buildings whose design was inspired by that genius which in the art of Greece taught the eternal beauty to the succeeding generations.—Yours truly,

T. G.
Glasgow: February 14, 1893.

The Victoria Concert Hall.

SIR,—In your report of Mr. Moreland’s paper on Steel Construction, you state that the steel work of Victoria Concert Hall was carried out under the direction of Knightley & Phipps. Please correct this.

Mr. Phipps was originally connected with the Hall, but retired before the building was commenced, and has had nothing to do with its construction.—I am, yours truly,
T. E. KNIGHTLEY.

106 Cannon Street :
February 28, 1893.

GENERAL.

The Imperial Institute will be inaugurated by the Queen on May 11. The ceremonial will be “full state.”

Mr. W. A. Boulnois, architect, died on February 23. Lately he resided at Inhurst House, near Basingstone, where, says the *Reading Mercury*, “he was ever striving to do good to others, and it may be truly said that he was beloved, respected and honoured by all, without regard to social, religious or political differences, and has left behind him the bright example of a well-spent, honourable and useful life.”

Plans by Mr. Lloyd Williams, of Denbigh, have been recommended for adoption for the county buildings for Anglesey, but as some doubt about the cost was raised, it was decided to lay the nine plans received in competition before the general committee at a special meeting to be held for that purpose.

An Exhibition of pictures was opened in the Bradford Corporation Art Gallery, Darley Street, on Wednesday evening.

The Southport Spring Art Exhibition, held under the auspices of the Corporation, was opened on Monday in Atkinson Gallery. The number of works exhibited amounts to 835 out of between 1,300 and 1,400 sent in.

Mr. F. Stanier, of Peplow Hall, has undertaken to defray the cost of restoring the old thirteenth-century tower of St. Giles’s Church, Newcastle-under-Lyme.

A Deputation from the Salford Town Council has visited Edinburgh for the purpose of inspecting the provision made by the City Council in the way of artisans’ dwellings.

The Surveyors’ Institution will meet on Monday, March 6, when a paper will be read by Mr. P. E. Pilditch, entitled “Dilapidation Practice, particularly as affected by some recent decisions.”

The Architect.

THE WEEK.

THE duties of borough architects are generally very onerous, and it is to be expected that they must occasionally succumb to their work. At the same time an elected body is in a difficulty when a contingency of that kind arises. Ratepayers grudge all expense on architecture, and they expect their officials to have nerves of steel. In Dublin there is a case of the kind. Mr. FREEMAN, the architect, is suffering, and of course there is inconvenience to all. The circumstances are explained in an extract from a report of one of the committees, which was read on Monday:—"We were compelled in October last to ask the city architect for an explanation of the fact that several matters which had been referred to him remained unattended to, and after an interview with him the following minute was made:—"Mr. FREEMAN attended, and offered as an explanation his continued ill-health and nervousness, and inability to do any work since his reappointment, but undertakes to renew and finish up all arrears of work." This undertaking has not, we regret to say, been fulfilled, and matters have been still further delayed by the absence through illness of the city architect for the last month. If we are to continue to control that branch of the corporate work which involves the management of the city estate, and if the Municipal Council decide to maintain the present arrangement by which the borough surveyor is held responsible for the work of the architect's department, an architectural assistant must be appointed on whom thorough reliance can be placed. The carrying out of such an arrangement must of necessity raise the question as to whether, contemporaneously with the employment of professional assistance of the kind, the Corporation can continue to retain the services of the city architect. We think the Local Government Board auditor might regard as an illegal expenditure the payment of salary to an architectural assistant for the discharging of duties which should be discharged by the city architect. Something, however, must be done to secure prompt attention to the references from this committee dealing with the city property, and, in our opinion, the wisest and best course to adopt would be to take into account the health of the city architect, which since his reappointment has been to some extent the cause of the block of our business in his department, and to grant him a retiring allowance." Some of the members of the Corporation were disposed to deal with the case as if Mr. FREEMAN were to blame, others wished to allow him to retire on a pension. Eventually it was decided to refer the question to a special committee, of which Mr. J. L. ROBINSON, architect, will be a member.

MANY of the recommendations of the Departmental Committee respecting the Ordnance Survey deserve to be accepted, and the money that is required for the purpose should be granted without delay. The 1-inch map cannot be made too perfect, and the facilities which exist for preparing maps with information that is not generally needed obviate the necessity for crowding the general map with lines, figures and names that make it illegible. But as the maps on larger scales are really prepared for the benefit of a few people, it is well to avoid extravagance on them. What benefit can the public gain by having currant bushes in back gardens surveyed with the utmost accuracy? If owners of property or corporations require plans on a scale of 10 feet to a mile or 5 feet, they ought to have them surveyed, or they could easily work them on the main lines laid down by ordnance surveyors and fill in detail. Why should railway companies have surveys of the country traversed by new lines prepared for them at the public expense, for that is the desire which has caused much of the outcry about the necessity of having revised plans? With as much reason purchasers of single houses could insist on having plans of all the floors supplied to them from the Ordnance Office. All the parts of the report which relate to plans on a larger scale than 6 inches to the mile should therefore be considered with caution. If the Statistical Society would undertake the inquiry they would amaze people by the peculiarities of the sale of the maps.

We believe there are many sheets which are never sought after by purchasers. It would, of course, be absurd to limit the survey to those parts which people care to possess; but, on the other hand, it seems waste of money to make surveys on a large scale when ordinary purposes would be served by a much smaller scale.

THE governing body of Winchester College have come to a decision which will cause much dissatisfaction. Our readers are aware that in last May a meeting of Wykehamists was held, at which it was decided to elect a committee to consider the suggestions that might be offered for commemorating the quincentenary of the college. In the course of a month it was decided to confer with the governing body and an architect as to the building of a new chapel, and as to the best means of reseating the existing chapel so as to accommodate the largest possible number, and with or without a gallery on the west wall, but without any structural alterations, and to obtain an estimate of the cost. Mr. J. T. MICKLETHWAITE, F.S.A., was selected as architect. Subsequently plans were prepared for the reseating of the chapel, with the seats running east and west, and for the erection of a gallery at the west end, which, in the opinion of the sub-committee, met the requirements for sittings, and would have made a very great improvement in the interior of the chapel. As regarded a new chapel the sub-committee reported that the proper site for one, should one be built, would be in the warden's garden, with access to it from cloisters or through *non-licet* gate. The proposals were submitted to the governing body. It was then officially announced that, while appreciating the generous intentions of the committee, yet in view of the great divergence of opinion among Wykehamists as to the proposals for the rearrangement and refitting of the present chapel, and the erection of a new chapel, the governing body were unable to give their consent to any of the plans submitted by the committee. The two schemes are, therefore, rejected, and there is a risk that a rare occasion for displaying affection for the old college in a substantial form will not be utilised.

THE Commission of the Municipal Council of Paris have considered the proposed sites for the international exhibition of 1900. Eleven members—that is a majority—have voted for the selection of the Champ de Mars, while there were only five members in favour of a site in the Bois de Boulogne. The decision has given much satisfaction in Paris. At first some people for their own interests tried to make out that particular places which could be secured on easy terms were especially advantageous for a universal exhibition, but it was not long before the motives of the recommendations were seen through. Eventually it was discovered that there were only three places belonging to the public which were worth serious consideration, viz. Vincennes, the Bois de Boulogne and the Champ de Mars. Vincennes was found to be better adapted for fêtes and other spectacles than for several buildings. The character of the Bois de Boulogne it would be risky to alter, and, moreover, a large proportion of visitors would be dependent on the moderation of the owners of voitures to reach the buildings. As already Parisians have had experience of what companies and drivers can exact, they would be too sanguine to expect that reasonable fares would be sought in 1900. There remained the Champ de Mars. It may be taken for granted that the buildings which the late M. ALPHAND prized so dearly will have to be removed by one fell stroke. Novelty is indispensable in the appearance of an international exhibition, and as Parisians have little regard for the past, they are not likely to sacrifice a costly undertaking for the sake of buildings that have already served the purpose for which they were designed.

THE Committee of the British Columbia Protestant Orphans' Home have invited designs from the architects of Victoria for an orphanage to accommodate 100 children. The limit of cost is 20,000 dols., and premiums of 100 dols. and 50 dols. are offered to the authors of the designs placed second and third. An assessor is to be employed. The instructions issued to competitors comprise a report and sketch plan, prepared for the committee by Mr. R. OWEN ALLSOP. Designs will not bear names, or mottoes but are to be numbered as they are received.

H. TAINÉ'S THEORY OF ART.

THE death of a writer whose books were as well known to foreigners as to his countrymen is necessarily a loss to France, but it is more than literary skill that has passed away with HIPPOLYTE ADOLPHE TAINÉ on Sunday morning. As a *littérateur* he was not esteemed like ERNEST RENAN. With all his shortcomings, RENAN was almost loved; his failings were accepted as the inevitable consequences of his Gallic nature. His countrymen were aware that, like him, they were logical and illogical at the same time, ready to sacrifice their happiness to ideas that brought misery, and, as it were, to make themselves the slaves of words. RENAN could one day show himself as reverential as any of the peasants of his native district, and next day could mock what he had adored. But his manner of expressing his thoughts was enough to captivate all who were offended by them. It might be supposed from the way he was treated by opponents that they believed he was not entirely wicked, and was mainly anxious to display his skill as a writer by treating subjects that were generally considered to be outside the *belles lettres*. He was, as it were, a conjurer who in graceful curves could toss about things which wounded hands that were less dexterous. The game was dangerous, but he was saved by finesse. Then again, RENAN belonged to the old school of writers that, spider like, were supposed to derive their works from themselves. He wrote about what he felt and what he saw. As became a Frenchman, he was assured that he represented the race that was the utmost development of nature. Destiny had placed all other beings at a lower level. It was not surprising that he should advise humanitarians to adopt the most philosophic and most effectual remedy for earthly ills, which was to teach all nations to laugh like Frenchmen. No doubt in so writing RENAN had given way to Chauvinism, but still, he was asserting the independence of the individual, the right to act according to the whim of the moment, and a sort of defiance of fate.

M. TAINÉ might be considered as following a very different sort of course in his teaching. By race he was thoroughly French, for he belonged to the Ardennes, but he was unable to persuade himself that his countrymen were not inferior to the English and the Germans. According to TAINÉ the four caryatids of humanity were SHAKESPEARE, DANTE, MICHEL ANGELO and BEETHOVEN. France was therefore supported instead of supporting. It must not be imagined that his manner of assessing the value of his countrymen in relation to humanity was the consequence of some slight he had received or of "a fit of the blues." At the beginning of his career, in the thesis ("Essai sur les Fables de La Fontaine") which he submitted when he sought his degree of doctor of the Sorbonne, we find that he judged French literature from an exalted standpoint and found it imperfect. DE MUSSET, who was supposed to express the feelings of the most refined part of his countrymen, was declared to be "un tapageur," whilst VICTOR HUGO, who was then held to be more sublime than MILTON, was described as "un épileptique." M. TAINÉ recognised a genuine Gallic type of writer in LA FONTAINE and to some extent in RABELAIS, MOLIÈRE and VOLTAIRE; but taking French literature as a whole, it appeared to him as a rehash of German thoughts with those of Greeks and Romans, or, to express it in another way, a variation of foreign airs. It says much for TAINÉ's courage that he ventured to show such impartiality at the most critical time in his career, but more credit is due to the people who could honour and reward so severe a censor. From his early conclusions he never retracted, and there are no books which are better adapted to humble French vanity than those which came from M. TAINÉ's hand. His masterpiece is undoubtedly the "Histoire de la littérature anglaise."

It is not our business, however, to deal with literary questions. We refer to this subject in order to make TAINÉ's standpoint more clear. A writer like RENAN, who keeps on common ground, can hardly fail to aggrandise the things which have interest for himself and the men around him. Such views sometimes become parochial, cockney, or of "the Parisians of Paris," who believe there is nothing civilised beyond a section of the boulevard.

Perhaps it would be more exact to say it is the unscientific view. Now, TAINÉ was of a scientific turn. We do not mean that he was strong in any branch of physics, or that he was competent to write an authoritative treatise on economics. But he attained the scientist's idea of force, and he recognised that it was not in any way limited by the boundaries of states, nor acted only in times which men accept as the political eras. To a French geologist the phenomena in Wales, Antrim, the Hartz Mountains or the Sandwich Islands are as interesting as any to be seen in Auvergne or the quarries round Paris, and there can be no doubt that M. TAINÉ showed a similar impartiality in treating of art and literature. However closely he might look at things, he did not esteem them as if they were unique. Thinking of humanity as a whole, is it a wonder that he sometimes failed to take men at their own or their admirers' valuations? This catholicity of judgment is suggested in one of M. TAINÉ's early lectures at the Ecole des Beaux-Arts. When speaking of the modern method, which was his own, he said:—"It has sympathies for all the forms of art and all the schools, even for those which seem to be the most opposed; it accepts them as so many manifestations of the human spirit; it considers that the more they are numerous and contrary, the better they exhibit that spirit by numerous and contrary sides."

But there was supposed to be one drawback attending his mode of study. It was said to have a tendency to dwarf individual powers. We read much in CARLYLE, as in his German teachers, about the influence of "environments." In TAINÉ the environments are factors of greater importance. In the same way as an agriculturist might demonstrate the relations between the qualities of any sort of crops and the position, subsoil, surroundings, atmosphere, drainage, &c., of the ground whence they came, TAINÉ maintained that to judge not only an artist or a poet, but every man of talent, we must not begin with investigating him: the preferable course is to start with the analysis of the living and lifeless things about him, and after the process the mystery of his life becomes revealed. Science is mainly concerned with the impersonal, or, as the French doctor said, soul is not comprised in a diagnosis, and M. TAINÉ endeavours to eliminate individuality or any other element that will disturb his process. He found that many of the seeds cast into the earth did not germinate when the conditions were not favourable to growth. There was a corresponding state of things affecting art. A peculiar moral temperature, he said, was necessary for certain sorts of talent; if it did not exist the talents died, if it varied the talents varied, and he went so far as to suppose that the moral temperature might even make a choice between the different species of talents, allowing some to develop while others were excluded from its influence. Physical temperature was not of more importance in respect of plants than was the influence of the time or the "température morale" on mental growth, and by considering its peculiarities we could understand the phenomena at one period of pagan sculpture, at another of realistic painting, mystical architecture or classic literature, voluptuous music or idealist poetry. Everything was to be explained by the environment: "les productions de l'esprit humain, comme celles de la nature vivante, ne s'expliquent que par leur milieu."

This theory will explain one of the characteristics of M. TAINÉ's writings on art and especially on painting. He describes at great length events which took place in Italy, but of a kind that VASARI would not introduce in his biographies—festivals at courts, public celebrations, the eagerness of collectors to secure examples of ancient art, or of courtiers to obtain beautiful stuffs, the interest excited by new poems, the appearance of strangers in cities and so on. In the same way he shows the influence of the events in the Low Countries on the painters. To paint the portrait of an individual M. TAINÉ likes to have an immense canvas, which he crowds with figures. He does not make them form only a background. He loves animation and colour, and has undoubted talent in producing dramatic scenes. He therefore puts all his force into that part of his work. If the subject of the portrait accordingly appears insignificant somewhere in a corner, that does not move M. TAINÉ. Individuals are rarely grandiose, and by what law should they be made more

prominent than better men? Thus, when he has to represent ROBERT BURNS to Frenchmen we see the new inventions, the increased exports of the eighteenth century, the French Revolution and its heroes, the battle of Talavera, the philosophers of Athens, Rome and Alexandria, ALEXANDER THE GREAT, DESCARTES, LOCKE, GOETHE and his "Faust," and the German poets, so that the fiery-eyed and amorous Scotsman, when we at last discern him appears to be a commonplace person who has gained reputation under false pretences. We have no right to quarrel with artists of originality. Why should not M. TAINE be allowed to display his power in surrounding a subject with diverse figures when the old portrait-painters might enclose the heads in floral wreaths or introduce imaginary battles and mythological scenes in their backgrounds? M. TAINE's own practice is an exemplification of his theory. As the artist is only an *enfant de siècle*, a child of the time, it seems appropriate that his inferiority should be suggested by suggesting his inferiority to something that is greater than himself.

It is needless to say that M. TAINE's theory is not novel. In one of his early articles MACAULAY takes great pains to prove by numerous instances how "it is the age that forms the man, not the man that forms the age," and how "great minds do indeed react on the society which has made them what they are, but they only pay with interest what they have received." In France the theory was held by MONTESQUIEU and others. But M. TAINE has worked it out more elaborately and rigorously than any of his predecessors, and especially in its application to art and literature.

It may even be said that he gave to theory a significance which was novel. In the accounts which have appeared in the journals this week, and which describe M. TAINE's training, there is no mention of the influence which had more to do with his way of thinking than any other. If he differed from the majority of students who passed through the Collège Bourbon and the Ecole Normale, it was owing to the revelations of life which he obtained when he shared the young physician's garret, where the furniture consisted of a bed, two chairs, a wardrobe and a skeleton. There he studied with most success, and there obtained some glimpses of those arcana which are not unveiled for ordinary students of literature. TAINE had not SAINTE-BEUVE's physiological experience, for he was not a hospital pupil, but he was more able to turn the little he knew to account. Numerous as have been the comparisons between a Gothic church and other objects, who before TAINE ever thought of describing it as the adornment of a nervous and over-excited woman, the expression of a crisis? His precept to the students of the Ecole des Beaux-Arts about the necessity of possessing genius, which was, however, "l'affaire de vos parents, ce n'est pas la mienne," and his advice "pour fabriquer de belles races," and many other passages, suggest he was as vain of his physiology as MICHEL ANGELO was of anatomical knowledge. As a psychologist he depended on material evidence, the soul and the deity were alike disregarded. His assumption that all people with a musical turn were disposed towards Protestantism, whilst Catholicity attracted all who favoured the plastic arts, also seems to be derived from something he heard from a physician about the wide relations of undisciplined emotions.

It is allowable to apply TAINE's theory to himself, and to say that he simply expressed the tendencies of our time. Whatever the origin of his theory, it is not difficult to see its effects. As every age has a character of its own, it follows that arts and artists must correspond with the respective transformations. There cannot on that ground be any fixed standard of art, and moreover, according to TAINE, all varieties of art, however opposed they may be to each other, are alike interesting when tested by a rational system of æsthetics. It might be going too far if we asserted that Impressionism and other novel modes of expressing form were inspired by M. TAINE's teaching, but there is no doubt his lectures and writings are an apology for them.

As he did not advocate a fixed standard in art nobody will be anxious to obtain a professor of æsthetics to fill the chair at the Ecole des Beaux-Arts who will expound M. TAINE's doctrines. His successor may be a man who will believe that artists should always have Greek works before their mental vision, or, like REYNOLDS, will introduce the practice of MICHEL ANGELO on every

occasion that may arise, or will idolise one of the ancient masters of France. In any case we must expect only a partial, a one-sided explanation of æsthetics. TAINE's system (if it deserves that name) at first sight appears to be freedom from respected precedents, a sort of go-as-you-please practice. It approves of license, but it deprives the artist of the privilege to feel that he is expressing his own thoughts, for he becomes only a sort of instrument which is employed to express the feelings of the crowd. M. TAINE, it appears to us, in his reasoning has confounded the patron with the artist. We may grant that in different ages there may be demands for different classes of work; one time battle-pieces will be in favour, or drinking scenes, or sporting subjects, or sculpture pieces, or *genre*. Architecture also has its favoured species. Necessity may compel artists to carry out the class of work that is the vogue, but it does not follow that such examples are always to be accepted as those which the artists would consider as worthy of their powers. If BARRY were judged by his Houses of Parliament alone and SCOTT by his Foreign Office, would the estimate of their ability be exact? In all times we fancy the same state of affairs prevailed, and although theorists may see in the examples the tendency of the spirit of the age, it would be erroneous to believe they exemplify the spirit of the artists. In that way, at least, M. TAINE's theory fails. Under certain conditions it may be exact, but it is not adapted for a general rule. It may serve for mediocre artists, it does not fit those men who are accepted as guides by their contemporaries and posterity.

It would be difficult to evolve a theory which is more gratifying to the public. They may lay the flattering unction to their souls that they are joint producers of the art and literature of their time. It is to be hoped they are prepared to show their satisfaction by a generous outlay to secure the treasures they have inspired. If so, M. TAINE's memory will long be green. In England we have reason to regret the loss of a man who spared no trouble to convince his countrymen of the value of English literature and the freedom, cultivation and happiness of the life it depicts.

THE STUDY AND PRACTICE OF ART.

AN address was delivered by Mr. Walter Crane on Saturday to the students of the Municipal School of Art and the Technical School, Manchester, of which the *Manchester Guardian* gives the following report:—Mr. Crane, who was cordially received, said that various views of an artist's life and motives for following art were apt to present themselves to those on the threshold of the vast field of its study. They either looked upon it as a thing to be pursued for the pure love of the thing, for the extreme delight and fascination which the pursuit of such a wonderful thing exercised upon them, or they were attracted to it because it was a very pleasant means of getting a livelihood. Perhaps, also, they regarded it as an amusement, a pastime or an accomplishment, but this third reason might perhaps be dropped altogether as of no account, since art could not be studied to any purpose except in a serious spirit. In practice it generally came about that the first two had to be reconciled in some way, and it became a pressing question sooner or later as to how to do so. It was always well to remember that there was no natural connection between love and money in the arts, and indeed, it would be better if all work could be inspired by and done for love. At the same time, under present economic arrangements, the labourer was at least worthy of his hire. To paint great masterpieces and make fame and fortune was an ambition given to few to realise. The masterpiece, at all events, must be a labour of love, whether fame or fortune followed or not. Good art, like virtue, was its own reward, but just as virtue required appropriate conditions for its development, so the artist required support and sympathy. The potentiality for art existed in a rudimentary way, though in very varying degrees, in perhaps all individuals, but as a general rule skill and facility were only acquired at the price of constant devotion—a devotion spontaneous and sincere. Even great gifts of natural or inherited adaptability required to be strengthened and made supple by study and constant practice and observation. Where from the earliest the student had been surrounded by the tools and implements of art, when he had seen it progressing before his eyes, the gain was enormous over those who took up their studies late, and to whom the world of art was comparatively mysterious and strange. The mere imitative impulse which appeared to be possessed in common by all mankind in a little degree would, in the first instance,

gain a certain ease and facility of hand in dealing with tools, which itself was a very great advantage to begin with. In fact the first consideration in studying art was facility of hand. Without it really nothing could be done, since the power of expression was so much dependent upon it. Facility of hand could clearly be developed by exercise, just as muscular strength could be. From simple exercises a student might advance, and those who developed more faculty or taste in certain directions rather than others might pursue further those particular branches, making them main studies to which other side studies would contribute. The use of colour and the habit of working directly on the paper with the brush would, again, give enormous facility and precision of touch, of great value to the designer of patterns, and also to the pictorial artist. Method was a question of habit, and in many departments of design precision of touch and directness of execution were of the greatest importance. It was this quality of precision and technical adaptability to the conditions of manufacture which had, he believed, induced many manufacturers to seek their designs and working drawings on the Continent. From the specimens he had seen, however, he could not say that he was impressed with the originality and fertility of the designs. Yet after all we must concede that morally our French or German brother had as much right to life as we had. Competitive commerce certainly was no respecter of nationality. We must all take our chance in the world's market nowadays. We were all chained to the conqueror's car. We needed a new Petrarch to write the triumph of commercialism, and a new designer to picture it. He was afraid the modern triumph, such as it was, was pictured for us in the rampant poster, which pursued us in and out of stations, up and down streets, and even along our railway lines. He did not say the poster had no place in art. Under considerable restraint and chastening it might be possible to make the announcement of useful wares and theatrical events at least inoffensive, and it might be that the mere working of competition would produce a demand for more refined productions. But let us keep it out of our scenery. Anyway the subject was important, since our hoardings were evidently the most obvious public educators in pictorial and typographical design. It was, after all, what met our eyes every day that influenced us. It was the surrounding, the set scene of everyday life, that affected our artistic sense more than anything. While a visit to a museum or art gallery was only an occasional matter, except for students, the mass of mankind must take their impressions of colour and form from what they saw around them. It was, as they knew, the persistence and aggregation of small causes that had played the chief part in the moulding of the earth as we saw it, and which were continually changing its aspect. In like manner the general sense or sensitiveness to beauty was acted upon unconsciously, he had no doubt, by the aspects of everyday life, by the colours and forms of the street as well as by the pictures and furniture of our domestic interiors. If this theory were correct, it followed that anything which impaired that sensitiveness must injure the faculty of its appreciation and production. We had been too careless in this matter, and constant toleration and familiarity with hideous surroundings tantalisied and blunted the perceptions. Manchester had had so many æsthetic stones thrown at her lately that he would not specially dwell upon her artistic aspects, but, seeing how largely ugliness of form and colour prevailed in at least the externals of modern life, especially of our manufacturing centres, it was perhaps not surprising that a certain cult, a certain worship of the ugly, should have obtained a footing even in art. He did not deny that there were certain tragic aspects of industrialism, a certain weird fascination, in drifting clouds of smoke and beauty in the forms of escaping steam, and that graphic representations of the various restless aspects of modern life had, in proportion to their sincerity, historic value. It was, at all events, our life, and must be recorded, though it lent itself to the art of the newspaper. But a great deal of clever art could be put into a newspaper. Our newspapers were perhaps getting the better of us. Like Chronos, the press devoured its own children, and no one knew how many geniuses were yearly swallowed up or how many lives and talents were consumed in order that the comfortable world should have its dish of news and views at the breakfast-table. Art might be said to be divided into the pictorial, the creative and the pot-boiling kinds. The first two were governed by their own laws and the individual preferences of the artist; the third depended upon the state of the market, averages and the laws of supply and demand. It seemed quite possible in an artistic life, while preserving an ideal of beauty of design and workmanship in whatever direction, without sacrifice of principle, to remain in touch with the ordinary wants of humanity, to realise that that art was not necessarily the highest which was always in the clouds, but indeed that all kinds of art gained in character and beauty in proportion as the ideas they expressed were inseparable from the materials in which they were embodied. Sincerity was the fundamental condition of good design and workmanship, which never prided themselves on imitating qualities which properly

belonged to other forms of art and other materials. There were two systems or methods of education in art, the academic and the experimental, or relative and adaptive. The one treated art or design in the abstract, on certain cut-and-dried principles and methods, passing every mind through the same mill, without special reference to any particular conditions of craftsmanship or individual preferences. The other taught design in concrete forms, and in direct relation to tools, methods and materials, with the object of calling out the individual feeling and setting it free to express itself under the natural limitations of art in its own way. The latter, he supposed, was intended to be the method of the new technical schools, so that a student might really acquire a practical working knowledge of the peculiar requirements of design to be reproduced in any process of manufacture, instead of being launched on the world with vague general ideas of drawing and painting, but ignorant of how to apply them. It, of course, remained to be proved how far technical schools could really efficiently take the place of the old workshop training under the apprenticeship system, which led to good results in the past; but while one must recognise that changed times required new methods, it ought also to be clearly realised that efficiency in the use of tools and materials and adaptability to materials, with the view of bearing on the prosperity of trade and supplying manufacturers with more highly-skilled designers and workmen, went to form one aim and ultimate object. On the other hand, was the like efficiency governed by the fresh creative impulse of artists and craftsmen taking keen pleasure in their work, with leisure for reflection and enjoyment, and the gathering of fresh ideas from no poor, mean or stinted life, deprived of the stimulating influences of natural or architectural beauty or the touch of refinement, with the stimulating emulation and co-operation of fellowship instead of cut-throat competition. These were two ideals, somewhat distinct. It remained to be seen which goal we should ultimately reach. At present the requirements of artistic ideals were not always identical with the demands of commerce, and sometimes not so in any sense at all. It therefore became a question for the individual artist how far he could, without casting away or losing sight of his higher ideals and aspirations, associate himself with work of a less ambitious, more immediately serviceable, but not necessarily less artistic kind. It was here that technical knowledge would come in to help him, and there was room for the very best talents and invention in design in the work of the loom and the printing press, iron, wood, stone, metal, glass, in a thousand materials and forms which contributed to build up the life of ordinary civilised man. When the design and construction of our furniture and the various patterns and accessories which ministered to the daily wants of humanity fell into purely mechanical hands, and artistic craftsmen no longer concerned themselves with the unity of use and beauty, the sense of beauty and pleasure in life which came of the exercise of the artistic faculty and of its appreciation, both were in a fair way to perish of inanition. As in the pursuit of art we advanced in the possession and interpretation of beauty and in the power of conferring higher pleasure to the cultivated senses and intellect, so were the forms of art apt to be placed higher in the scale. But high art could only mean the art which embodied the highest beauty and conveyed the most lasting and ennobling pleasure. It was its quality more than its particular form which settled this. Sharp lines of demarcation were often drawn between fine art and decorative or industrial art which had proved very misleading. A good design was better than a bad picture any day. But the arts were really an equal brotherhood. Excellence in any one branch probably required as fine capacities as excellence in another. Beauty was of different kinds, but perfect beauty of design and workmanship must be acknowledged to be so after its kind whenever it was met with; and who was to hold the scales between one kind of beauty and another? If an exquisite work of the loom satisfied the eye with lovely and subtle harmonies of colour, with delicate, beautiful and inventive design, and even suggestions of romance and poetry, could the finest work of the painter give more? Were threads and dyes necessarily inferior to colours and palettes, or the loom less a work of ingenious joinery than the easel? Whatever might be the official and scientific classification of the arts agreed on, there was but one spirit in which to study and practise in any or all of them—sincerity in love of beauty. Artistic feeling was shown often as much in the judgment which restrained or forbade ornament as in the fertility of invention from which it sprang. Organic consistency, adaptation to purpose, harmony and relation to surroundings were qualities at least as important as ornament. Yet it seemed often to be thought that decorative art meant ornamenting something, while the very word decoration must mean something appropriate, fitting, perfectly adapted. If the sense of beauty was really a living and effective force we should consider it a crime to destroy natural or architectural beauty, or to take away the public possession or enjoyment of it by any means, and should insist that the problem of utility was but half solved unless the result was harmonious. At present the world

seemed too busy about other matters—dissecting and analysing, buying and selling, experimenting, manufacturing and speculating—to care collectively for beauty perhaps; and truth was at present too many-sided and composite to be easily reconciled with beauty. All was tumult and conflict, and through the smoke and dust of the commercial competitive battle in which we spent our lives we were not quite sure when the sun was shining, and when we were sure were perhaps too busy making the proverbial hay to notice the beauty of it. That was only for artists and idlers, and the world had such a horror of idleness that people not condemned to hard labour had acquired a habit of being extraordinarily busy about nothing in particular. It was supposed to be a conclusive argument against Socialism to ask, "What will you do with the idle?" which seemed a little like raising an objection to eating one's dinner because one did not know what one would do when one was not hungry. Artistic ability and power of design were often talked of as if they were in the nature of conjuring tricks, and their exponents, like those automatic machines in the stations, which only required a penny in the slot to satisfy every ordinary modern human requirement. It was not sufficiently realised that the sense of art and the power of its creation was a growth of the mind which must have its processes of germination and fruition. Art was not nature. It was a commentary or creative variation upon it, but in the progress of its own development art followed natural laws. Truth and beauty were true lovers, but the course of true love never did run smooth. While truth in various disguises was roaming desert places, sometimes like a knight errant fighting with sphinxes and dragons, sometimes, like Thor with his hammer, striking blows the effects of which were only seen long afterwards, beauty, like an enchanted princess, was often shut up in gloomy castles, closed round with thorny woods or thronging factory chimneys. It was their business to re-discover her, to awaken her, to interpret her afresh to the world, and to show that if beauty slept our senses were only half awake and our lives a meaningless monotony.

The Mayor of Manchester proposed a vote of thanks to Mr. Crane for his address. This was seconded by Dr. Ward and carried with acclamation.

BUDDHIST ART.

A LECTURE on "The Buddhist Art of Ancient India" was given by Mr. J. Kennedy at the Midland Institute, Birmingham, on Monday. The Buddhist period in India, it was said, extended over twelve centuries, and to that period all the earliest monuments of Indian art belonged, and, with very few exceptions, all these monuments were dedicated to the service of the Buddhist religion. The monuments themselves extended over a period of nearly ten centuries, from the time of the Indian king, Asoka, about 250 B.C., to the end of the seventh century of our era. Buddhist art formed the foundation of Burmese, Chinese and Japanese architecture. There were, however, two reasons, altogether apart from historical reasons, why we should interest ourselves in Buddhist art. First of all, it demonstrated the popular side of Buddhism; and, secondly, because it enabled us to trace the growth of an architecture purely indigenous, which began from the simplest elements, and evolved itself into a highly finished art. Originally the Indians used wood and brick alone for their buildings, and stone was employed only for the foundations. The first impulse to Buddhist stone architecture and sculpture came from Persia, and the Assyrian system of sculpture also came into India through Persia. A much greater impulse came from the time of the brilliant reign of Alexander, 327 B.C. Dealing with the historical and philosophical basis of Buddhist art, the lecturer showed how Buddhism, though apparently unpropitious to the development of any art, did produce the finest art that India had ever seen. It was in the monasteries, meeting-halls, temples and residences of the Buddhist monks that this art was developed. Buddha, though belonging to the materialist school of philosophers, advised the people to continue their ancient worship. An important part of this worship was that paid to the dead and the erection of tumuli to their memory. The lecturer showed by the means of some very fine lantern views how these tumuli developed into large circular domes of brick with processional walks round them, and the daghoba, or sepulchre, in the centre. The outer enclosure was built of stone, but the structural forms were all of timber, and so, too, was the elaborate ornamentation of the gateways. The first idea of Buddha himself as an object of worship came from the Greeks, who had settled in Northern India, one of their coins, of which a picture was shown, affording the earliest example of a representation of Buddha. Gradually the multiplication of images of Buddha came to be regarded as meritorious, and the architectural ornamentation of the stupas or topes gave way to sculpture of the most elaborate character. The daghoba, too, gradually became a shrine, and eventually the image of Buddha took its place. The lecturer traced in a similar manner the gradual development of the rock

monasteries, temples and halls of meeting into magnificent examples of architecture, and showed how the style naturally grew from that appropriate to timber into one more suited to stone. The temples were also adorned with frescoes, which in power of drawing and force of expression far exceeded anything that could be found in Europe at the same period, the fifth and sixth centuries of the Christian era. Some of the Buddhist shrines, he pointed out, bore a remarkable resemblance to the Byzantine works of a later period, or to the work which in Europe was called Mediæval.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

A CONVERSAZIONE of this Society was lately held at Drapers' Hall, Throgmorton Street, by permission of the Drapers' Company. Dr. Edwin Freshfield presided, and read a paper "On an Early Book of Accounts of the Churchwardens of All Hallows on the Wall" (exhibited by the Rev. S. J. Stone, M.A., rector), also some remarks upon "The Fruyte of Redempcyon," by Symon the Anker, of London Wall, printed by Wynkyn de Worde, in 1514. Dr. E. Freshfield commenced by exhibiting to the meeting a drawing of the old church of All Hallows on the Wall. He then briefly described the former church, which escaped the Great Fire, and which he said should have been preserved; it would have been an interesting feature in London, but the demon of destruction was as much alive in the eighteenth century as it is now, and the consequence was that among other objects of Mediæval interest whose loss they had to deplore was the old church of All Hallows. It was the only church which actually abutted on the Wall, and the semicircular chamber which now formed the vestry was built inside one of the round projections of the Wall. The parish in early times was about one of the very worst parts of the City. Outside was Finsbury Moor, a receptacle for all sorts of horrors. The lowest and worst part of the population and the most degraded used to reside in this parish, and the proceedings in Guildhall testified generally to the want of respectability. The account book was one of extreme interest, and he had no doubt that when it was printed, as it would be, in the "Transactions" of their Society, it would be read with extreme pleasure. He then gave several quotations from the book, and next referred to "The Fruyte of Redempcyon," and said that the author, "Symon the Anker," was an anchorite of London Wall. The book itself was in too tender a condition to permit of its being exhibited, but it had been transcribed, and it would also be printed in the records of the Society. The Rev. J. A. L. Airey, M.A., rector, next made some observations on the recent restoration of the church of St. Helen's, Bishopsgate. He said he was not an expert in archæology, but the work which had been done here was of more than ordinary interest. It had been the habit of late to condemn restorations generally, but theirs had been one of necessity. When he was first presented to the united benefices of St. Helen's and St. Martin Outwich, he was astonished at the disgraceful condition in which he found the church. He and the churchwardens, who seconded him, obtained the necessary permission to have the church thoroughly restored. The miserable substitute for the heating apparatus, with the coal-hole and dustbin, he found in one of the corners of the sacred edifice. The vestry-room was a mere box and the ancient roof was hidden out of sight. The plaster on the walls was hanging in shreds, and the damp throughout was eating everything away. The registers in the safe were coated with thick mildew, and it was almost impossible to make out the entries. In fact, to use the words of a friend, the whole place looked like "The church in rags!" In January, 1891, the Charity Commissioners granted them 3,000*l.*; the Merchant Taylors' Company, the patrons of the living, supplemented that with a grant of 3,500*l.*; while the Leathersellers', the Grocers', the Skinners' and the Drapers' Companies had all subscribed and assisted both in money and in kind. The work was now approaching completion, but a great deal had yet to be done. Everything of an antiquarian interest had been preserved, and the disfigurements of recent times had been effaced. The flooring had been raised at some time or other; there were a large number of human bones found immediately below the floor. The church was now in a thoroughly sanitary condition, the bones having been removed in 200 leaden coffins to Ilford, and he was pleased to announce that the Bishop of London would reopen the church on Saturday, June 24 next.

Mr. Charles Welch, F.S.A., hon. secretary, then described a very curious wall-painting representing Jonah being cast into the sea, and which was exhibited to the meeting. This wall-painting had been discovered last autumn during the demolition of five small old houses on the south side of High Bridge Street, Waltham Abbey. A water-colour drawing of these houses with their gable fronts was shown to the meeting, showing the Abbey a short distance off. All traces of the

buildings had disappeared when the painting came under Mr. Welch's notice, but it had been admirably preserved, and in his opinion it was of the sixteenth century.

Mr. J. G. Waller and another gentleman also addressed the meeting, and concurred that the date of the painting in question was of the sixteenth century or about the reign of King Edward VI.

The Rev. Prebendary Whittington described the communion-plate of St. Peter's Church, Cornhill. Two of the large silver-gilt cups were very curious and "were given by Thomas Symonds" (with their patens) in the year 1625, at least so it was stated on them, but Mr. Cripps (an authority on these subjects) said this was not so; one of them was the real old original cup of the reign of Edward VI., and no doubt made out of a still earlier pre-Reformation chalice in accordance with Puritan notions, and in compliance with episcopal visitation articles. Very few of such cups were left; there was one, however, at St. Lawrence, Jewry. The cup at St. Peter's was of the year 1549, while the fellow one was of the year 1625, and so were both the patens. The second cup had been made to match the old original parochial cup, and somehow the donor's name had been put upon both. The two tall flagons were also of the year 1625, and were the gift of Alderman Westrowe.

Major Joseph, C.C., described the plate of the parish of St. Antholin, Watling Street, and exhibited a list of forty-seven donors who subscribed for the reseating of the church just after the Great Fire of London. This parish is now united to St. Mary Aldermanbury, Queen Victoria Street. Among the plate was exhibited a fine alms-dish of the year 1685, "the gift of Elizabeth Fudick, maid-servant of the parish of St. Antholin's, for the use of the communion-table."

Mr. St. John Hope briefly described some of the Roman and other articles in the exhibition; these consisted of a very large collection of antiquities discovered during the past seven years within and around the City of London and collected by Mr. James Smith. The meeting then dispersed to view this handsome collection in the spacious court-room.

Among the articles exhibited was a good collection of Roman and other coins, many of them of the Plantagenet and Tudor periods, and some of them of the reigns of Elizabeth, the Charleses and James II. There was also a number of tradesmen's and abbey tokens. There were some Roman amphoræ (which had been discovered in London Wall); flint celts and Celtic pottery, bronze pins and Roman buffware. Among the Roman lamps was one found in Moorgate Street, in an admirable state of preservation. There were also keys, knives, horseshoes, &c., of various periods, and a collection of smoking pipes. Among the pottery of the seventeenth century was a jug with a quaint motto:—"Fast and pray, pitty the poor; Amend thy life and senne no mor. 1656." There was also some Roman leather work, one specimen being a child's sandal, with the lace still attached to it. It was stated that the Corporation contemplated purchasing this collection for the Guildhall Museum.

TESSERÆ.

The Marseilles Warehouses.

THE bonded warehouses, or "entrepôt commercial," for the port of Marseilles form one block of buildings. Two lines of railway, and a public thoroughfare which runs parallel to it, separate these buildings from the Dock du Lazaret. On the east side are sidings from the Paris, Lyons and Mediterranean Railway, a junction with this line having been made by means of an incline and a tunnel under the town. The length of these warehouses is 365 mètres (1,200 feet), with a breadth of 37·5 mètres, and a height of 35·7 mètres. The offices are of the same breadth, with a length of 37·6 mètres. The warehouses are divided into four quarters, each containing an interior court with two doorways. There are six storeys above the ground-floor, with vaults below, the whole having been constructed in stone and iron, the concession requiring that all the materials should be fireproof. The masonry is, for the most part, a better class of irregular rubble; but the piers, arches, quoins, windows and ornamental work are of dressed ashlar. The cost of the several kinds of masonry and brickwork per cubic metre was, hard limestone dressed and built in place, 4*l.*; less hard quality, 3*l.* 4*s.*; soft calcareous stone from Miramas, 2*l.* 2*s.*; rubble, 12*s.* 6*d.*; and brickwork, whether of solid or of hollow bricks, 2*l.* 8*s.* per cubic metre. The thickness of the walls is 1·25 metre at the foundations, 1·08 metre at the ground-floor, and diminished gradually to 0·58 metre at the sixth story. The ground-floor is supported by massive stone pillars and vaulting, while the other floors rest on cast-iron columns. All these warehouses were constructed without the aid of scaffolding, by means of three travelling cranes, two on one side and one on the other, of the buildings. These cranes consisted simply of a jib, 28 mètres in length, suspended a little below its centre; the extreme load lifted at one time was 2½ tons, and per day, by each crane, 150 tons. There were 14,136 cubic mètres of masonry in these warehouses, and it had cost 3,000,000 francs

(120,000*l.*) exclusive of the foundations; the latter having cost 203,000 francs. All the doors and window-frames are of wrought-iron, 30*l.* per ton having been paid for the former, or in all, for the doors alone, 4,800*l.* The floors for each storey are composed of wrought-iron double T girders ½ a metre in depth, 4·53 mètres in length, and weighing 145 kilos per metre. These rest on cast-iron hollow columns varying in section at each storey, according to the load. The junction of two columns with the wrought-iron girders was made in such a way as to allow of the expansion of the girders taking place. One column simply rests on the top of the other, the two ends being turned in a lathe, while the girders rest on the lower flanges of the upper column, the attachment being by bolts. The columns were all cast vertical, are 4 mètres in height, and were tested to support a vertical load equal to 8 kilos per millimètre of section. The wrought-iron girders were subjected to a tensional force equal to 12 kilos per millimètre of section. The vaulting between the girders is built of hollow bricks 6 inches deep. The floors were all constructed to carry 2 tons per square metre. The girders of the roof are composed of two angle irons at the top and two at the bottom of the section, separated by strips of flat iron, forming a sort of lattice web. The girders are free to move in the direction of their length, resting simply on a cast-iron shoe embedded in the wall. They are 4 mètres apart from centre to centre, and were separated at the crown by similar girders. The tiles were supported by iron of an A section, 8 centimètres in depth, and galvanised. It was calculated that this roof would sustain 4 cwt. per square metre. The vaulting between the girders was of hollow bricks, similar to those used for the floors, but much lighter. The vaulting cost, including all expenses, 6*s.* 8*d.* per square metre. The quantity of cast and wrought-iron was 340 tons, and its mean cost had been 24*l.* per ton. The total cost of these bonded warehouses, comprising machinery, hydraulic pipes, &c., had been half a million of pounds sterling.

Adaptation of Figures to Limited Spaces.

One of the greatest difficulties in architectonic decoration is to include the whole of a design within the boundaries of the space allotted for it, so that the figures are not maimed by losing parts of their limbs, or, by passing unseen beyond those boundaries, made to appear as if they were independent of the building of which, as decorations, they form essential parts, and whose functions their subjects are intended to illustrate. Not only is the law which requires this difficulty to be overcome strictly logical and consistent—as the laws of art ever are—with the plainest common sense, but it is illustrated by the practice of the Greeks, by the great architectonic sculptors of the Middle Ages, and by Michel Angelo himself—e.g. for the first, let the student look at the compositions of statues which filled the pediments of the Parthenon, and he will find that not a figure was maimed, not a limb was missing. What should we say if the slope of the gable of the eastern pediment had carried off the head of the Theseus? or if Hyperion, where he rises, with outstretched arms, guiding those mighty, golden-maned horses, as they breast the morning sea, had not found room to ascend upon his course? Did not the chariot of Night fill, in a similar manner, the opposite angle of this pediment? Do not the glorious statues of Ceres and Proserpine, even in the positions of their arms, harmonise perfectly with the lines of the architecture of which they formed parts? Is not this the case on the opposite side of the composition with regard to the recumbent Fates? In the western pediment of the Parthenon the same rule obtained, and the figures of the river deities, Cephissus (Ilissus) and Callirrhoe, not only indicated the territorial limits of the theme illustrated by the design as a whole (it was the contest of Athene with Poseidon for the glory of naming Athens) as bounded by those streams, but aptly filled the lower angles of the gable. In the friezes and in the metopes, not only of the Parthenon, but in the Temples at Egina and Phigalia, the same law is marked as inviolable, and there is neither foot nor finger of those many hundreds of figures which is excised, scarcely a piece of flying drapery but is complete. Turn to the sculptors of the Middle Ages, and in their works no violation of the law in question appears to have been sanctioned. The figures in the quatrefoils on the west front of Wells Cathedral, wrought ere Cimabue was born, illustrate the feelings of their carvers on this point. In the portal of St. Trophime, at Arles, the saints are standing side by side, but not one has lost a limb; in the tympan over the door of the same portal the figure of Christ is brought in front of the architectural lines, not, however, so as to break them violently; this is observable with regard to the nimbi of the saints before named. There is one exception—the tympan at Autun, where the claw-foot of an Evil Spirit passes beyond the boundary of the design; but in this case the artist has been careful enough to give the end of the limb as it appears outside the line. Over the doors at Auxerre, in the voussours and sides of the portals of that cathedral, as well as at Bourges, St. Gilles, Sens, Vezelay, and elsewhere—whether the work be grave Romanesque, soaring spiritual Gothic, or exuberant

Flamboyant—in it the rule was obeyed, in small things as in great. As to Michel Angelo, let any one take up an engraving from the roof of the Sistine Chapel, and see at what sacrifices of grace the great master obtained the privilege of making his figures large in size, and at the same time left them whole and unmaimed. There would have been no difficulty in the matter if Buonarrotti had been content to reduce the size of his figures; this he would not do, and yet he succeeded in occupying every one of those strangely-shaped compartments with magnificent examples of composition—that they should *compose* was really the hardship of the achievement—such as, in their way, are unsurpassed. We doubt if there is a single figure on the roof of the Sistine Chapel which does not comply with the law we have endeavoured to recall. From the pediment of the Parthenon to the trefoils at Chichester, that law has been obeyed. Michel Angelo did not dispense with it.

Unity and Variety.

The most universal feature in the various kinds of beautiful or pleasing objects the generality of philosophers have held to consist of unity amid variety, and the apprehension of this perfection is an intellectual act. Symmetry, order, fitness, harmony and the like are but special forms of this unity. The suitable proportions of the lineaments of the face, of the limbs of an animal, and of the constituent portions of a building, the admirable co-ordination of the several parts of a flower, and the unity of ideas which should run through a musical air, a poem, or a drama, are all but varying expressions of the one amid the manifold. Monotony is painful, sameness wearies the faculties. On the other hand, chaotic multiplicity, disorderly change, overpowers and prevents us from getting a coherent grasp of the confused mass before us. When, however, our energies are awakened into life by a rich variety of stimulus, whilst at the same time the presence of some central unity enables us to hold the several parts together with ease, there is produced in the mind a luxurious feeling of delight. A particular manifestation of this unity of thought in a work of art is utility. The mind is gratified by seeing how an object is adapted to the purpose for which it is intended. The structure of the greyhound thus embodies the idea of speed, the English dray-horse that of strength. The charm of a pillar in a piece of architecture depends as much on its obvious utility and fitness as on its own beauty, and the fundamental rule of Gothic art, that no ornament is to appear for the sake of ornament, is but a practical application of the psychological law. Objects which please indirectly, as in this way subservient to some ulterior end, are said to exhibit relative or dependent beauty; those which charm of themselves exemplify absolute, intrinsic or independent beauty. A flower taken as a whole may be described as absolutely beautiful, whilst the delight awakened by contemplating the fitness of its parts is an effect of dependent beauty. The extent and importance of this second kind of beauty gave occasion at the end of last century to the advocates of associationism to attempt the explanation of all forms of beauty by that principle. A plain of ripe, waving corn is beautiful in this view, because it suggests peace and plenty; a ruined castle because it recalls deeds of chivalry and prowess in past times. The influence of association in awakening agreeable emotions, and in giving an accidental charm to indifferent objects, is undoubtedly very great. The scenes of our childhood, familiar tunes, the rise and fall of fashions and the rules of etiquette all exhibit the beautifying force of this agency. Still it is a mistake to push the principle too far, and a sea-shell, a feather or a landscape must often win the approval of the severest æsthetic judgment apart from any extrinsic which it may possess.

The Hylesinus Destructor and London Trees.

About seventy years ago the elm trees in St. James's and Hyde Parks suffered much from an attack by a small beetle, and whole rows were rapidly being thinned and disappearing, both in the Mall and the Birdcage Walk. As the persons who had the charge of the plantations were entirely ignorant of the true cause of the mischief, and as it was clear that the trees died in consequence of being completely stripped of their bark, rewards were at first offered for the discovery of the delinquents who so mischievously barked them; but these were offered in vain. It was observed, however (and the observation claims some credit for its ingenuity), that no more of any tree was barked from the ground than what was easily within the reach of a soldier's bayonet; and this was sufficient to throw suspicion on some unfortunate recruits, of whom more than one was arrested, without producing any diminution of the evil. In vain, too, were persons employed to sit up during whole nights, watching for the enemy; the bark continued to be found every morning at the roots of the trees, and the park-keepers, after all their trouble, could only conclude "that the bark fell off in consequence of something being placed on the trunks in the daytime." About the same time, the elms in the Grove at Camberwell were observed to be undergoing a similar process of destruction; and the proprietors, being equally ignorant of

its cause as in the instances just mentioned, the injury was ascribed to the effects of gas escaped from the pipes for lighting the road, which had just been laid down, and legal proceedings were actually commenced for the removal of the nuisance against the gas company which had undertaken the supply. Entomologists, it is true, were aware that the operations of insects were the cause of all this mischief, but unfortunately they were not believed until the disease had reached that pitch which threatened to make remedy hopeless. But at last a naturalist was consulted, and he at once discovered that an insect, called the Hylesinus destructor, had located itself in the parks, and legions of these little fellows were quietly and constantly at work, secretly proceeding in their labours of destruction, in spite and in defiance of Lord Sydney's denunciations. But not only did MacLeay discover the cause of this evil: he, in the true spirit of philosophy, likewise directed a remedy to be applied, and these subtle miners became at once obedient to the voice of science, although they had defied the ranger's threats to prosecute them with the utmost severity of the law.

Knebworth in Hertfordshire.

The house, which stands on the highest hill in the county, was originally a large quadrangle with outer walls and courts, the east front or gateway having in truth been a portion of the ancient fort. For many years it had received little attention from its various owners, being for the most part uninhabited, till in 1811 Mrs. Bulwer Lytton, the mother of the novelist, proceeded to the task of renovation. It was found necessary to remove three sides; the fourth side, built by Sir Robert de Lytton in the earliest style of Tudor architecture, resembling Richmond Palace erected in the same reign, was preserved, strict attention being paid in all the repairs to the ancient character. The principal apartments are the banquet-hall, the oak drawing-room, the library, and the great drawing-room or presence chamber. The ceiling of the banquet-hall belongs to the age of Henry VII., the screen is Elizabethan, and the chimney-piece with the panelling appears to date from the time of Charles II., when Inigo Jones had made the Corinthian column fashionable. One door in this leads to the oak drawing-room, where, in the reign of Charles I., the great parliamentary leaders, Pym, Elliott and Hampden, used to meet to concert their measures, for the Sir William Lytton of that day, who sat in Parliament for the county, was their staunch supporter. A second door in the banquet-hall communicates with a large cellar, this being a rare remain of a singular ancient custom. In the olden time it was usual for the gentlemen after dinner to retreat, for the purpose of drinking, to a cellar adjoining the great hall, which with that view was always kept in the utmost order, and this vault is the more curious from the fact that there are few houses now remaining with similar constructions. The library, a large Gothic apartment, is entered from the oak drawing-room. The chimney-piece of this noble chamber is ornamented with the arms of the Lyttons, St. Johns, Beauchamps, Robinsons, Stanleys of Hooton and Grosvenors. A double flight of stairs leads to the state-rooms, the carved balustrades of which support the lion rampant, one of the ancient crests brought into the family by its alliance with the Strodes. The staircase itself is hung with trophies of armour of the time of Henry VII. and Henry VIII., and also with various pictures, some being family portraits. The windows are blazoned with descents from the alliance with Barrington and that of the St. Johns. The first state-room, though small, is ancient and curious from its walls being covered with old stamped leather, richly gilt and in high preservation, while the woodwork is grotesquely carved in panels. Upon the ceiling are painted the arms of Sir Rowland Lytton as heir-general to the families of Booth, Godmanster, Oke, Burnavil and Durward. Between this room and the long ante-room there is a communication. The latter deserves notice as being hung with bugle tapestry, of which it is probable that there does not exist in England a second specimen. From thence an oval drawing-room conducts to the old presence-chamber, converted by modern habits into a drawing-room, upon the ceiling and windows of which are ninety-nine quarterings brought in through the ancient families of Norreys and Robinson in the time of Anne, while the frieze below shows the arms of the descents of the late Mrs. Bulwer Lytton from the ancient British kings through Sir Owen Tudor and Elystan Glodrydd, from the Plantagenets through Ruth Barrington, and from the Tudors through Sir William Norreys's marriage with Anne Tudor, aunt to Henry VII. Amongst many relics of the olden time preserved in this room are two Gothic cabinets belonging to the age of Henry VII., sets of chairs with the old cloth of gold, a very curiously-carved and gilt procession of our Saviour to the Cross (the workmanship of the fourteenth century), and some ebony tables that were made in the time of Henry VIII. But every room in the house teams with rarities. Over the hall is the music gallery communicating with the round tower-chamber, hung with golden-stamped leather. From this is a corridor opening into the Hampden-room. The same passage leads to Queen Elizabeth's chamber.

NOTES AND COMMENTS.

WHEN, in December last, the London School Board decided to seek by competition some plans that would serve for a school on an ordinary site, it was intended to announce that the Board did not bind themselves to employ the successful architect in the erection of the school, and that the three plans, for which premiums of 150*l.*, 100*l.* and 50*l.* were awarded, should become the property of the Board. Mr. MACVICAR ANDERSON was consulted about the project, and he declared that the conditions were so prohibitory as to prevent architects of position or experience from competing. There was no doubt designs would be sent in, but they were not likely to be of value. Mr. ANDERSON proposed the following condition as a substitute:—"That the design to which the first premium may be awarded shall be the property of the Board, and that the author of such design shall be employed as architect to carry out the work in accordance with the schedule of professional charges published by the Royal Institute of British Architects." Afterwards Mr. ANDERSON added that if the Board claimed the second and third premiated designs without offering adequate compensation for them, it would prejudice the competition and deter good architects from taking part in the contest. The committee declined at first to give the needful guarantee, but it is now proposed to alter the conditions as follows:—"That three premiums of 150*l.*, 100*l.* and 50*l.* be awarded in the discretion of the assessor; that the set of plans for which the first premium shall be awarded shall be the property of the Board, and that in the event of the Board erecting a school according to the plans to which the first prize shall be awarded, the successful competitor shall be employed as architect, and shall be paid in accordance with the schedule of professional charges published by the Royal Institute of British Architects." All's well that ends well, and Mr. MACVICAR ANDERSON has been able by his firmness to gain the ends for which he strove as the representative of his brother architects.

THE subject assigned last year for the Prix Achille Leclerc, which is awarded by the Académie des Beaux-Arts, was a Bourse de Commerce in a maritime town. M. SIROT, a pupil of M. MOYAUX, was on Saturday declared the winner. The conditions of the Prix Houllévine, which is worth 200*l.*, were afterwards arranged. It is awarded every fourth year to the author of some example of painting, sculpture, architecture, engraving, musical composition, or of a book on art or the history of art produced within that period.

MESSRS. A. & C. HARSTON have so well served the Paddington Guardians as architects and for so long a period (about fourteen years), it is only natural they should regret severing their association with the Union. But they have announced that the pressure of business, which cannot be neglected, prevents them from proceeding with works which are now proposed. In their letter to the Board Messrs. HARSTON say:—"There is no other course open to us than to request the Guardians to select some other architect to take our place, to whom we shall be glad to render every assistance in our power." The Guardians, at their meeting on the 22nd inst., will consider the question of appointing a successor to Messrs. HARSTON. The Guardians have already received two or three applications, and are prepared to receive more from architects who are desirous to obtain the appointment.

THE Académie des Inscriptions et Belles-Lettres could not have found a more eligible candidate for the chair that was rendered vacant by the death of M. SIMEON LUCE than M. EUGÈNE MÜNTZ. The librarian and conservator of the collections at the Ecole des Beaux-Arts is not surpassed in knowledge of the history of the art of all countries and times by any scholar in France. The two volumes of his latest work, the "Histoire de l'Art pendant la Renaissance," are enough to make a reputation for a writer, but his "Arts à la Cour des Papes," "Raphael," "Précurseurs de la Renaissance" and numerous other works also testify to his mastery of many departments of art and archæology. We hope M. MÜNTZ may long enjoy the dignity he has so worthily earned, although it can hardly add to the interest possessed by all his books and essays. M. COURAJOD, of

the Louvre, who is an unquestionable authority on sculpture, was the principal competitor of M. MÜNTZ.

THE exhibition of MEISSONIER's works will give delight even to visitors who were fortunate to see a similar collection in the same galleries ten years ago. It is not every favourite artist who will bear the test of a contrast between his pictures. But there are circumstances which are in M. MEISSONIER's favour, and critics are likely to forget their severity before works that are so highly prized by collectors. The lending of so many precious little gems involves a good deal of self-sacrifice, however much may be the confidence the owners may have in committees and insurance societies. It is, therefore, creditable when it is found that a large proportion of the pictures will be shown in London for the benefit of the poor of Poissy, the town where M. MEISSONIER held the office of *maire*. French collectors may be assured that their property will not suffer any detriment while among us. The existing exhibition has one advantage over its predecessor, for the catalogue contains a study of the artist's character by M. ALEXANDRE DUMAS. The dramatist, we imagine, presents the early life of the painter in too sombre colours, for MEISSONIER had only a brief acquaintance with privations. But he reveals an amount of modesty in the artist that will surprise many. It will scarcely be credited that when MEISSONIER was the most prized of living artists, he was over anxious about the finish of his works, and was sincerely afraid they were not equal to the pictures and drawings by much younger men. The sight of a drawing by JACQUEMART kept him awake for the night, speculating about the manner in which the effects were produced. At another time he said he would cut off one of his fingers if by the sacrifice he was able to produce such water-colours as FORTUNY'S. He who was so fortunate with his miniatures held the name of MICHEL ANGELO in such reverence that he was once seen kissing the slippers which have survived the great Florentine. Haughty as he seemed to be, he was able to declare that he never gave way to a bad thought about any man. It would appear that MEISSONIER has been often judged wrongly, like many other artists, through ignorance of his real character.

THE demolition at Sandgate should be taken as a warning by people who wish to create new seaside resorts. The unfortunate town has grown rapidly of late years under the encouragement of the railway company and others. From the geological conditions the danger might have been foreseen. There can be no doubt that with the catastrophe any importance acquired by the town will be lost. Strangers will naturally hesitate about residing in a town which is exposed to such dangers. If the blowing up of a vessel was the proximate cause the buildings must have been exceedingly unstable. At the same time everybody must have sympathy for the sufferers, and under the circumstances it would not be unwise for the Government to help them, although the theory that there was an official error may not be recognised.

THE annual report of the Herkomer School at Bushey shows an increase in the receipts and expenditure. The total revenue for the year was 1,550*l.* 16*s.* 8*d.*, which is an increase of about 40*l.* on the amount of last year. All the items of revenue show an increase, the most important being that for fees, the receipts from which have now reached the total of 1,411*l.* 14*s.* 6*d.*, being an addition of 21*l.* on the previous year. The expenditure has, however, also increased, notwithstanding the efforts that have been made to keep the working expenses as low as possible. The profit made during the year has been 147*l.* 18*s.* 4*d.*, and the amount of 44*l.* 19*s.*, the deficiency brought forward from last year's balance-sheet, having been deducted, leaves the sum of 102*l.* 19*s.* 4*d.* as a surplus to start the new session with. The cost of erecting the new studio has been rather more than 700*l.*, and to meet this additional expenditure the Council have had to obtain a loan, but by the kindness of the treasurer, who has placed the sum of 500*l.* in school debenture bonds at the disposal of the Council for three years free of interest, this has been done at a small expense.

ILLUSTRATIONS.

STANMORE HALL.

THIS building is an example of what can be done in remodelling—a more difficult process than the construction of a new building. The works were carried out under the direction of Mr. BRIGHTWEN BINYON, of Ipswich. The illustration is reproduced from a photograph by Messrs. B. LEMERE & Co.

MERTON COLLEGE LIBRARY.

THIS is said to be the oldest building in England which has been in continual use as a library from the time of erection until the present day. The date of its foundation is about 1350. The dormers, without which very little light could have entered, were added in the sixteenth century. The woodwork was the gift of BODLEY, the founder of the Bodleian, somewhere about 1600. It is all of oak, and except the stair-head and balusters is unpolished. The plasterwork above the panelling at each end of the library was no doubt added at the same time. The roof, which was part of the original building, was renewed some years ago, but without alteration, and many of the original bosses were kept in position. With this exception, everything in the library has remained untouched. The illustrations are from measured drawings by Mr. H. M. FLETCHER.

EXPLORATION AT SILCHESTER.

AN exhibition of various objects, derived from the excavation on the site of the Roman city at Silchester, is being held at the rooms of the Society of Antiquaries, and will remain open until the end of next week. One of the objects is a fragment of a head of a colossal statue, with a mural crown, a portion of the hair, and one side of the face. It is conjectured that this belonged to the pre-Christian period, and may have constituted part of a statue of the tutelary genius Calleva, which stood in the forum before the principal entrance to the basilica. Many beautiful remnants of Purbeck marble were also found, as well as many whole pots and pieces of pottery of various degrees of excellence—some being of exquisite workmanship, and others of comparatively rough Byzantine designs. Numerous coins, articles in bronze, pewter, iron and bone were also yielded to the labours of the excavators.

The excavations of last year were carried on between May and November under the direction of Mr. Fox and Mr. W. H. St. John Hope. The operations have mainly been confined to the great central insula, with some local drivings into surrounding squares. The areas on the north, east and south sides of the forum and basilica have been carefully trenched and examined, and although mostly open ground originally, the foundations of several buildings have been met with. The north side yielded, besides the remains of a large house, an unusual number of pits from which were gathered pottery and other objects, as well as many interesting architectural fragments and pieces of worked marble. Amongst the architectural relics in the exhibition are the base of a column of the forum and a very fine capital of a Corinthian pillar. The east side revealed only slight traces of buildings, and was chiefly remarkable for an extensive deposit of oyster shells. The south side seems to have had a house at its west end. After harvest time—the city site having been under culture since the days of the retirement of the Romans—a broad strip of ground on the north side of the central insula was taken in hand, and was found to be cut off by a narrow lane leading to a large house on the west. This residence was peculiar in its arrangements, which are not easily made out by reason of various rebuildings and alterations. Gardens appear to have been attached to it. The remainder of this insula, which contains a round temple, has been reserved for excavation during the current year. The area north of the baths was singularly unproductive, probably on account of its having been open ground lying between two groups of buildings. As the foundations over many portions of the excavations have been fast weathering into decay, a good part, after careful examination, has been covered in again with soil.

The most striking result obtained is the discovery of what is believed to be the earliest Christian church in Great Britain. The outline and proportions of the church, which is within a stone's throw of the great civil basilica and forum first discovered in 1866 by the late Rev. J. G. Joyce, have been so clearly traced that Mr. Micklethwaite has been able to present a reconstruction of the edifice. It is of basilican form, with a nave, aisle and apse. The tiled space where the altar stood, with the tiles but

slightly disarranged from their original order, is plainly marked out; the ground plan shows the nave and space in front of the altar reserved for the priests, the aisles reserved for the worshippers, and the narthex at the further end of the church for the catechumens. The building was only a small one—about 45 feet by 25 feet—and it corresponds in outline and arrangement with the remains of early Christian churches in Central Syria and Numidia.

The site of the civil basilica and forum had been previously discovered. But last year's excavations have yielded such results as to enable a plausible reproduction to be effected by the Rev. Mr. Joyce, not only of the later buildings, but of an earlier one which preceded it. It was evident from the character of the remains that the earlier building had been destroyed by fire. In the first building there was a long row of pillars supporting a flat entablature. In the interval the principal of the arch supported by pillars had been discovered—a fact which seems to place the later structure some time after the period of Diocletian. The whole area of the former was about $3\frac{1}{2}$ or 4 acres. In the basilica, or rather in both basilicas, the position of the courts of justice, of the council chambers, and of the space in which elections and public meetings were held, can be made out with some approach to accuracy. In the later building one of the porticoes found in the earlier is omitted, so as to enlarge the space for public purposes. The baths, which were partially excavated some years ago, have been re-examined, and the source of the water-supply and the system of drainage have been exhumed. The tracing out of the latter, which entailed a great deal of excavating, led to an unexpected result—the discovery of a sluice or water-gate of remarkable construction in the city wall. There are hollow brick piers to carry vertical timbers, and retaining walls on each side of the passage through the inner earthwork, which have evidently been built against an earlier framing of wood.

All the objects hitherto found, except those brought to London for the present occasion, have been deposited in the Reading Museum, and carefully arranged by Dr. Stevens, the curator. The architectural remains are disposed in a separate "architectural" room. The executive committee propose to complete this year the insula in which is supposed to be situated the round temple and to excavate the insula south of this which extends to the city wall. But the committee are in urgent need of funds to carry on their work. Contributions may be sent to the treasurer, Mr. F. G. Hilton Price, 17 Collingham Gardens, S.W.

THE CORPORATION GALLERIES, GLASGOW.

THE report on the Kelvingrove Museum and Corporation Galleries of Art for 1892 states that the list of additions to the art collections in the galleries is more than usually important owing to the valuable gift of water-colour drawings by Mr. James Orrock, R.I., London. The series presented by him embraces examples of the works of Cox, De Wint, Cattermole, Bonington and others, pioneers in this branch of artistic activity, which is strictly English in its origin and early stages. It is, moreover, a department of art which hitherto has been practically unrepresented in the corporation collections, and while it forms an admirable nucleus, the gift draws prominent attention to the need for a fuller representation of water-colours generally, and of the works of the great English artists who were more or less the contemporaries and rivals of these artists. It is, further, a pleasant duty to record the gift of a portrait of a former Lord Provost of the city—William Mills—the work of Sir Henry Raeburn, and of a cabinet landscape by Horatio McCulloch, given by Mr. J. H. Downes. The whole of the works in marble in the galleries have been thoroughly cleaned in the course of the year, and thirty-two more pictures were covered with glass. Nearly all the more valuable pictures are now thus protected; and while the reflection from the glass surface is some hindrance to the comfortable inspection of the painting, the glazing will have a most beneficial influence on the conservation of the works themselves, which, while exposed to the evil influences of the Glasgow atmosphere, were certainly undergoing steady, if slow, deterioration. In the report for 1891 it was stated that the Association for the Promotion of Art and Music in Glasgow had, under the advice of Mr. Alfred Waterhouse, R.A., selected for further competition the authors of six sets of competitive designs for Museum and Art Gallery buildings in Kelvingrove Park. A final decision in the competition was arrived at in April, when, on the recommendation of Mr. Waterhouse, the designs submitted by Messrs. J. W. Simpson and Milner Allan were accepted by the committee of the Association. The architects' estimate of the cost of the complete building is 154,400*l.*, while the surveyors estimate the total cost at 170,370*l.* The precise site to be occupied by the building has been arranged between the Town Council and the Association, in terms of the agreement made on the formation of the latter body, and it is understood that the architects are now in course of preparing the

working drawings of the building. The clamant necessities of both Museum and Art Galleries for more and better space induce the committee to express an earnest hope that the least possible time will be lost in providing at least a portion of the building now agreed upon. The attendance of the public at both museum and galleries shows a considerable increase over the returns of the previous year. The steady increase of the public appreciation of the art collections, which has been made obvious for many years by increasing attendance, continues to be maintained, and there are many other signs of a healthy public interest in the galleries, of a desire for their larger usefulness, and of a growing pride in the art possessions of the city.

WALL-PAPERS AND STENCILLING.*

THE first record of the manufacture of paper-hangings in England dates from the year 1692, as a patent was taken out at that date by a William Bayley, who stated that his invention consisted of "several engines made of brass," for the printing of all sorts of paper, of all sorts of figures and colours whatsoever, and that "the said invention had not been heretofore known or practised by any of our subjects." There is no doubt the first attempts were the imitation of tapestry, linen, or other hangings that were at that time fashionable. In the reign of Queen Anne, 1712, a duty was imposed on paper-hangings. They were made on pieces, sixteen to twenty-four sheets, forming about eight square yards; each sheet bore the Government stamp; the duty was 1½d. per square yard. Paper-stainers were required to pay an annual license of 4l.

In the reign of Queen Anne paper-hangings were imported from China. Probably the first idea of their manufacture here was suggested by these importations. In 1746, larger blocks were used for wall-paper printings, some two yards long, made from light material, but these were soon found unsuitable, and were replaced by heavier and shorter blocks.

In 1753, Edward Deighton used engraved metal plates in a rolling mill. The designs were afterwards coloured by hand; gilding of parts was also introduced by him—doubtless suggested by the gilded leathers used in the sixteenth century—for wall covering. A man named Jackson, about this time, made and sold papers in imitation of statues, landscapes, &c., and quaintly remarks that "the persons who cannot purchase the statues themselves may have these prints in their places and thus effectually shew his taste." Whether his cheap antiques "caught on" I am unable to say. In a work printed by J. Nourse, in 1764, it is stated that there were three methods in use, namely, printing in colours, using the stencil, and painting with a pencil or brush.

These processes are described at some length, and approached the block printing now in use. Stencilling was found to be cheaper, but not so sharp as blocks. The pencil was used for finishing and adding further details. Flock printing was also described as giving faithful imitations of silks, velvet, damask, &c. A piece of paper was taken off the walls of a mansion near Whitehaven in 1786; it was asserted that it had been there for about 200 years. Its thickness was that of cardboard, and had evidently been fixed to the wall with varnish. The ornament had been stencilled and afterwards finished by hand.

Sherringham, of London, in 1786, as the result of journeys to the Continent, made great advances in the art of paper-staining.

Antony G. Eckhardt, in 1792, made papers from engraved copper-plates, and decorated them with silver and gold leaf. This gilding was the invention of John Hautch, of Nuremberg, about the middle of the seventeenth century. It was a preparation of tin and copper, and is now commonly known by the name of Dutch metal. Eckhardt also printed on stiffened linen, finishing by gilding and varnishing, and employing artists of considerable skill.

In 1796, T. G. Hawcock was the first to introduce embossed paper.

In the picture galleries at Hampton Court Palace are the remains of wall-papers which are asserted to date from the time of Charles I. There are, or were, some old flock papers on the walls of King William's bedroom, dressing-room, and writing-room. The date of their production I cannot state. They may not be very old, as the patterns are like the patterns used fifty years ago. Paper-hangings fifty years ago were made of several sheets, 23 × 28, fixed together in lengths of 12 yards. Lewis Robert, a French workman, in 1799, made a machine for producing paper in endless pieces; and, in 1803, John Gamble obtained a patent in England for making paper in endless sheets.

In 1836, the reduction of the duty gave a great impetus to wall-paper manufacture, with the result that their use was very much increased. In 1861 the duty was altogether abolished.

The first process in wall-paper manufacture is the prepara-

tion of the design. This, as a rule, is sketched out roughly on a small scale, but more frequently plotted out to the actual size necessary for the rollers or blocks in which it is to be cut. The usual area for roller printing is 21 inches by 21 inches; block printing gives a more extended surface, varying from 21 inches by 24 inches to 24 inches by 36 inches. On these areas the artist has to express himself as best he may, for the design must necessarily repeat itself correctly in these spaces. Should the designer be dowered with redundant imagery, these inexorable limitations become a tyranny and a chilling frost on his dreams.

It is well to work on a piece of paper 6 inches larger all round than your 21 inches by 21 inches. In the middle of this allotted space the design may be roughly sketched, running out certain large general sweeping lines across and into the outer spaces. The general purpose and direction of such lines the designer will have in his mind's eye, and if he is a fairly skilful draughtsman he may come very near the correct points on the edge of the space necessary for the repetition of his pattern. Unless the designer's conception first lives in his mental vision it will not come by any fishing process, or without previous thought or creation.

This rough design is roughly traced and placed at the sides, top, and bottom, so that the curves or other detail shall work out the correct repetition of the pattern. There are certain rules for working out in geometric patterns, but they are too complicated for present description. Some prefer to get the pattern in somewhat of a muddle, as the process of unravelling stimulates mental effort and invention—to fill up undeveloped spaces—thus obtaining more interest and thought in the detail.

When the whole design is complete in outline, it is transferred to a sheet of paper of the tint that is to predominate in your colour scheme; on this are laid the various colours in distemper as shall be used for subsequent printing. The design is carefully traced and transferred to rollers or blocks, which are destined to print the pattern on the paper.

These rollers have to be prepared with great care, and to be of thoroughly seasoned sycamore. All outlines of flowers, grounds, &c., are formed by driving into the wood, up to a gauge, copper slips, and the intervening spaces filled with felt, thus forming the printing surfaces. Sometimes the rollers are covered with paper one eighth of an inch thick, and the copper slips are hammered through into the wood, the paper acting as gauge. The paper is picked out and the spaces filled with felt. The copper bordering keeps the whole design sharp and permanent. The edges formed by the incised printing pattern, if of wood only, soon become ragged and worn.

Each colour requires a separate roller, and when attempts are made to imitate the colours and gradations of natural flowers it is no uncommon thing to have twenty separate rollers.

The enormous cost of cutting twenty rollers for the printing of one paper should be the means of opening our eyes to the fact that, if wall-papers are to conform to the best traditions of decorative art, such a multiplicity of tints can never be satisfactory. All fine decoration is simple, and of a limited scale of tints and gradations. Manufacturers now, in employing designers, generally stipulate a limited number of printings, on the score of expense of production. They thus, shall I say unconsciously, are furthering the best decorative ends, remembering that wall-paper is an adjunct, within the reach of moderate means only, not the whole end and ideal of decorative art.

For roller printing the rollers are very accurately mounted on a large revolving cylinder, the latest type of cylinder being capable of carrying sixteen printing rollers, thus, at each revolution, turning out a paper containing sixteen printings. The paper is first carried from a smaller supply-machine, which regulates the supply and tension of the material against the rollers, these being supplied with the necessary printing tints from an endless blanket roller, revolving through troughs of colour. When the paper has received its printed pattern it still further travels over a succession of rollers, through the drying-room; when perfectly dry it is transferred to a machine for cutting into lengths of 12 yards. A machine carrying two rollers produces paper at the rate of about four miles an hour.

In the blocks which are to be used for the hand-printing of wall-papers the design is first traced upon the block, and the portions which are not to be printed are cut away, leaving the design, as originally traced, in relief, and this relief surface, of course, takes the colour from the colour blanket, and that, with lever pressure, transfers itself to the paper. Occasionally however, where the lines in the drawing are very fine, it is necessary to use metal slips, as the wood would be liable, in washing and in the process of printing, to break away, or at least to warp. The block is previously dipped in a blanket-lined trough containing the colour.

In hand block-printing the paper is drawn across a long table. The printer places his block accurately on the paper, the former being regulated by him at each corner with gauge-pins, to insure accuracy at each length of printing. Then pressure, through an upright lever, is applied, and the impression made.

* A paper by Mr. T. R. Spence, read at a meeting of the Applied Art Section of the Society of Arts, and published in the Journal.

Blending is obtained by coating the blanket with a number of tints. An oblong trough, containing a number of varying colours, stands near the printer, and the attendant, with a long brush, dips it into the trough, and then brushes it over the blanket. Sometimes the blanket is merely dabbed over with several patches of colour. The colour is then transferred to the block, as previously described, the result giving blended and varying tints to different details of the design.

When the paper comes from the manufacturers it is of one uniform white tint, and requires the application of colour grounds. The paper is carried through a machine on an endless roller, over a large cylinder, above which are fixed a succession of brushes, which are of different degrees of coarseness or fineness, as may be desired to give varying textures. The paper comes in contact with an endless colour-soaked blanket which supplies the colour. After passing the brushes it travels over smaller rollers into the drying room, the length of its journey being regulated to complete its drying.

Flock paper-hangings are printed in the details of the design in size. The flock—which is composed of the cuttings of woollen cloth, cut up in a mill to the necessary degree of fineness, and dyed—is then sprinkled over the paper, adhering to the part charged with size. To get a higher surface the sizing and sprinkling is repeated.

Gold is applied much in the same manner, the metal dust being sprinkled on to the paper, and adhering to the forms previously printed in size. Gold-leaf is sometimes used, and afterwards drawn through a machine for burnishing.

Ordinary embossed papers are drawn through a machine into which is fixed a cylinder of brass, on which is cut the necessary raised design. Other methods are used, the paper being prepared with gum-size, parts are gilded, and then the paper is stamped with heated metal dies.

Embossed flock is the result of embossing on the top of ordinary flat flock.

The glittering grounds so much in vogue are produced by dusting on talc before the ground is perfectly dry, the gum contained in the colour forming a size, to which the talc adheres. These grounds, if used sparingly, give brilliant results. Fine effects are produced by printing in transparent colours on these grounds.

The most sumptuous wall-papers are those in imitation of embossed leather. The best of these have all the artistic qualities of the latter material, the only difference being that the leather will wear longer, but in the paper there is nothing to complain of on this score. The production of these is an expensive process. If cost debar us from using the material in large quantities, it can be used for friezes, say above a high oak dado, or in squares or panels. The first process in manufacturing these is to have the design embossed on a copper sheet by a man possessed of the best artistic feeling obtainable; every valuable line and form of modelling by the artist will be afterwards faithfully reproduced in the paper. From these embossed copper sheets an electrotype is taken, which forms the matrix into which the paper is pressed when in a moist state. Such a method results in far superior quality to impressions from roller-plates. The surface is gilded with gold-leaf or Dutch metal, and afterwards entirely painted by hand. These English-made papers are much more permanent than Japanese leather paper, and, I am sure, equal them in artistic qualities. Another treatment of these is to print with lacquers on a gold ground, obtaining the beauty of transparent tones of colour.

There are many other forms of wall covering made of paper, such as Japanese leather papers, Lincrusta, anaglyptic, Tynecastle tapestry, &c., which I refrain from describing, as they would require an evening devoted to them entirely.

In addition to printed paper decorations, there is another and older method called stencilling, capable of many varied and delightful results. By cutting out in paper, zinc, or brass plates, ornamental forms, and laying them on a flat surface, rubbing through with short stumpy brushes charged with colour—thus transferring the design to the object on which it is laid—any number of tints may be used, each requiring a separate stencil-plate, through which are cut the forms of each detail of each colour. There are two general methods of stencilling, the first, which gives the actual design in the colour applied; and the other, where the stencil is cut to form a background, so that the forms of the design are expressed by the original colour of the ground. The latter, in cases where practicable, gives the purest and most brilliant result. I am not able to say whether the ancient Egyptians and Greeks used this method for the numerous repetitions of their conventional designs of the lotus and acanthus. Were we using such ornament now this method would form the first stage, if they were afterwards worked on by hand. However, the historical aspect of the subject is not, in the present instance, of importance. There is little doubt stencilling was largely used in the Middle Ages. In various parts of Italy and France I have seen the roofs of churches and the ceilings of palaces covered with charming examples of pure stencilling. It was very much in vogue

during the last century and the beginning of this. In Indian temples it has been largely used. During the last century there were several guilds of stencillers, as it was an important form of industry. The Japanese have used it for the decoration of various materials, many of their silks and other dress materials being covered with ornament executed in this manner. Their skill in cutting the most delicate lines and forms has enabled them to execute the most wonderful and complicated schemes of colour decoration on almost any substance. They cut the patterns in paper made of mulberry fibre, four or five at a time, with a long thin knife and delicate punches. When finished one sheet is covered with some adhesive material. On this is placed a number of threads of silk, which form ties to hold the whole design together. This process completed, another cut sheet is placed over the threads and underlying stencils, and the whole pressed accurately together. I believe in many human hair is used instead of silk.

All the same effects as are found in wall-papers may be achieved by stencilling. From the examples shown here of stencilling applied to wall-papers by an advanced modern method, we find qualities much beyond what is usually accepted as stencilling. The process is not to be described any more than that of painting a fine water-colour, in which the artist uses numberless methods of his own to arrive at the expression of his idea. You may stencil bright ornament on a dead ground, or *vice versa*. The forms may be raised with repeated application of colour, or stencilling may be executed on any specially prepared uneven textured ground. It may be and is used largely for stencilling in the general colour of any ornament on which you propose to relieve by shading or tinting, and is a very simple and direct method for accurate setting out, as it were, elaborate arrangements of ornament for such subsequent finish. In the decoration in ornamental forms of large interiors it forms the basis of all detail.

In cutting stencil-plates ties are necessary, in every detail, to hold the plates together. These, if judiciously distributed, form a great additional element to the beauty of the design, giving a fillip of light over the decorated surface. A practice to be condemned is what is termed the mending of ties. This method takes all the life out of the work.

In conjunction with wall-papers stencilling has many uses, such as the filling of forms where the set pattern of the paper will not apply, and is very effective in filling in special forms, such as the spandrels of arches, recesses, friezes, oddly enclosed and moulded spaces. Given such unusual shapes, opportunities occur for giving your whole scheme of decoration a fillip, additional interest and unity.

In the wall-papers now produced by many manufacturers we have, at a moderate cost, a means of using a very extended scale of the finest ornamental forms clothed in garments of an almost infinite number of colour gradations, whether the schemes in detail are strong, broad, or delicate. Those who possess any innate sense of good colour, and a perception of the conditions of lighting and forms of rooms, may, in their homes, have their love of harmonies gratified.

Now that our education in decoration (as exemplified in wall-papers) has been so much advanced during this last twenty years, instead of using narrow strips or borders about 3 inches wide, we crown our wall spaces with a frieze from 12 inches to 24 inches wide, thus having a fairly liberal decorative area. Such dimensions, I think, might be increased with advantage to 36 inches, or even 40 inches. The frieze is now generally divided from the wall filling below by a moulded picture rail 2½ inches deep, making a pleasant and decided separation between the two.

These mouldings have a groove on the upper edge, into which small brass hooks are placed, on which to hang pictures. It is both a useful and ornamental treatment, and obviates the use of brass rods, which are difficult to fix and soon tarnish.

I advocate the use of a deep 30-inch frieze for various reasons. In the first place its generous area cuts to some degree the fetters of the designer. Here he may do his best, and when it is fixed we get the true and undisturbed value of his imagination. All the pictures being below his scheme of decoration, the moulding and frieze defeats that common practice of hanging pictures near the ceiling, and of building them up in pyramids on the wall under the vain delusion that they "match."

We quite forget that the treasures we hang on our walls are there for the delight of examination, and consequent revelation of whatever charm they may possess in themselves. By means of the picture rail and deep frieze we get nearly all our pictures on the line. This is the haven in which the artists who produce them would have them rest. The best position for all landscapes should be where their horizons are level with the eye. So also figures should have their eyes level with the spectator if possible.

I have no sympathy with the common idea that you decrease the apparent height of your rooms by deep friezes, supposing you do suffer from the optical delusion of losing 6 inches. Is there not a sense of quaintness and comfort in a

room that is low? At any rate, we all feel how pleasant and cosy are the old farmhouses with low-timbered ceilings. This sense of snugness is well illustrated at the Château of Blois, where the timbered ceilings of the rooms are comparatively low, and are coloured a sea-green blue, to which is superadded an abundance of coloured and stencilled ornament. There is a sense of restfulness and comfort in the two small ante-rooms (having ceilings of a similar character of decoration) which come between the two great halls or council-chambers in the Ducal Palace in Venice. The vast pictures by Veronese and Tintoretto in the large halls are wonderful in themselves, but I venture to say they do not express the same quiet decorative fitness as do these small ante-rooms. The same may be said of the suite of small low-ceilinged rooms which were the favourite private apartments of Isabella d'Este in the Ducal Palace at Mantua.

This palace is by many considered the most magnificent example of interior decoration of the Renaissance. Yet these rooms and their decorations only live in one's memory out of the hundreds of magnificent apartments in this vast palace. I can well imagine the haven of rest they must have been to the daughter of the Ferrara's, amidst the turbulent magnificence of the Gonzaga's. Of course, they have the added charm of low windows and vistas of the Lombard plains. In the Palazzo Rezzonico, now occupied by Mr. Browning, is a magnificent suite of reception-rooms decorated by Tiepolo; attached to these is a suite of smaller rooms, delightfully quaint and low, showing that the old Venetians had combined with a love of magnificence a true appreciation of the pleasure to be found in a low and shadowed retreat. I by no means deprecate the fine sense of space and magnificence of rooms having large and generous dimensions, but we, who of necessity must live in apartments of small dimensions, should accept their proportions and devise our treatment accordingly, not cherishing the fallacy that good decoration consists of delusions of scale.

All papers used in staircases, and other apartments where the light is defective, should have their ornament bold and strong, delicate combinations of tones being reserved for rooms well lighted. There is a tradition that all ceilings should be light in scale. Well, many should be, but they may be successful in deeper and richer tones.

Remember the blue of a summer sky sometimes, and use it as a suggestion.

Gold, on ordinary papers, when perfectly flat, is not always pleasant. The true glory of gold refuses to express itself except on undulating surfaces, where its metallic lustre is developed.

In colouring the surrounding woodwork of rooms, it is a comparatively safe rule to select a tint from some section of the ornament in the wall-paper. In selecting wall, frieze and ceiling-papers, it is well that the wall-paper should be darkest in tone, the others ascending in the scale of light, and each having the same tints of colour running through, but in varying degrees. This is recommended as avoiding an effect of disturbed harmony, but possessing a colour instinct, daring arrangements of contrasts may be accomplished with success. I should say, avoid marbled wall-papers, even if a Tadema is outside your means.

The great weakness of English colouring is its paucity. There is no reason why our wall-papers should not be fuller and richer, containing more primaries and less dirty tones. The shadows made by projecting furniture and the absence of really brilliant light will always soften and give negative tones.

The old Venetians revelled in the fulness of tones; why should we not follow their example, and take suggestions from their source of inspiration, which was the barbaric splendour of Eastern colour? We all recognise and admire the redundant richness of colour as found in Persian fabrics, Japanese lacquers and Moresque tiles. If this wealth and brilliancy is a delight in sunnier lands, it should be doubly welcome to us, where grey days are our portion, and the consequent need of the joys of colour charm all the greater.

It is an error to think that on a ground of strong colour our pictures suffer. If we take care that our areas of colour are flat, and contain some sense of broad unity in the whole scheme, this will not occur. I mean in the absence of every disturbing or restless detail, such as we find in the elaborately printed efforts to reproduce naturalistic flowers, &c. I feel that these backgrounds may be as strong as you like, if the parts are well balanced, and each colour of pretty near the same depth of tone. Gold or black picture-frames are a sufficient separation. Besides, these being nearest the eye are made up of mouldings, such modelled forms carrying the highest lights and the strongest darks, lift them clearly away from the merely surface colour on which they hang. If you place any actual object on the most powerfully painted picture, it will always tell as a strong disturbing element.

As the best French painters teach, the accessory, or object to be represented on the first plane, or nearest to the spectator, should carry the highest lights and the intensest darks. Strong lights may be used in the receding planes of the picture; but,

to express their relative relations, the gradations of the shadows must be weaker in degree as distances are expressed.

This constructive method is, therefore, a question of values, so that the assertive expression of a moulded form cannot be much weakened by a backing of flat colour. Black or gold, even if assertive, is always valuable in any colour scheme. No one knows this better than the Easterns, as you will find these two elements playing an important part in all their compositions.

When gold is used it should be in liberal areas, not in thin strips, which is commonly known as "hatching." A common cry now is, that what is termed an "all over" treatment is best; that is, the areas of the details of the design should be nearly all equal, so that no feature should obtrude itself in the design. I am not altogether in sympathy with this variation in areas; the treatment may be rendered quiet in effect by a nearer relationship of tones in the colouring. If certain strong elements in the design assert themselves, in horizontal and perpendicular lines, why quarrel with such results, as nearly all fine expression in architecture is obtained by the accentuation of horizontal or vertical lines; triangular assertions of features are certainly objectionable.

I have every reverence for the great designs of the past and its suggestions, and there are certain dignified uniting lines and forms that we may well borrow from the Renaissance, or other periods of ornament, which are invaluable in the expression of vertical or horizontal forms necessary to fill certain decorative spaces, but underlying or woven into such valuable accentuating forms of expression there should be added something of the designer's own individuality or creation. I am sorry to see so much borrowed from the period of the decline of fine styles.

It is lamentable to see the present craze for the slavish copying of French Rococo ornament, a period containing all the worst features of an expiring art. How these can be accepted in preference to the fine English feeling for design and colour, exemplified in the productions of our manufacturers during the last fifteen or twenty years, is a mystery to me. The French papers at the exhibition of 1889 may have created this fashion. If such is the case, the influence has been on the wrong side, for I am sure the wealth of colour, original and artistic design of the English exhibits of this material completely threw in the shade the worn-out features of French design. Their patterns gave evidence of archæology dressed in smart new clothes only, not of any new thought.

Two of the most important qualities in decorative design for wall-papers should, I take it, be a general flatness and colour harmony.

By the former I mean the spaces of colour forming the scheme should be flat in themselves. If any attempt is made at relief, it should be of a rigid or conventional character, in the form of precise lines or melting gradations, following and accentuating the leaves and other forms, &c. Flowers modelled with endless printings defeat the repose and breadth of wall-paper as a decorative accessory. How can we hope to give the adequate subtlety of the numberless gradations of flowers by machine printing and the crudeness of distemper colour when the best of the Dutch flower painters fail, with all their delicate manipulation, endless labour, and the wider range of possibilities of the mediums of oil or pure water-colour, in rendering perfectly the numberless subtle tones of flowers?

The aim of wall-paper decorations is not realism.

If flowers and foliage are the source from which our creation springs, we should try to give an idealisation of their charms, coupled with a subtle and critical selection of those parts that assume the finest curves and give the most interesting areas of colour. This idealisation must be expressed by what I may term convention, or a fine sense of adaptation and ordered arrangement to its decorative purpose.

We venture on a thorny path when we talk of the artistic treatment of wall-papers. Any theories that I may have propounded are only those of an individual. Gather lessons in decorative colour from the broad unity and tender harmonies of twilight, rather than the restless brilliancy of noon.

We are now so stored with knowledge of every period and style of decoration, that the expression of any personal views or attempts at creation is like venturing on thin ice.

We hear from one that the archaic work of the Greeks is greater than its perfect fulfilment in the age of Phidias; from another that the art of the Mediaeval ages embraced all that was living and fervid. Raphael and Michel Angelo are torn from their thrones to make room for Carpaccio, Bellini, and Botticelli. Rembrandt gives way to Velasquez. Pre-Raphaelism is asserted to be a dead letter, and the new and brilliant planet, dubbed Impressionism, to contain the cream and embodiment of all art, and so on and so on.

I make no apologies for quoting the great painters of the past as bearing on ornament. I maintain that mere ornamentalists have not given us better decorative forms (exclusive of figures) than the former.

The searching nature of a painter's practice goes deeper into the mysteries of colour in relation to nature, and when he adds ornament to his work it is, I take it, more subtle than that of the man whose aim is on a lower scale.

I fail to find ornament containing more colour, harmonies and invention than that found in the works of Francesca, Carlo Caravelli, Mantegna and Holbein.

It seems to me the invention, beauty and variety of ornament as displayed in Mantegna's frescoes in the church of the Eremitana at Padua, the castle of Mantua, and the church of St. Zeno in Verona has never been excelled by men whose sole function is the making of ornamental design. The strength, vigour, redundancy of colour and decorative fitness displayed by him in the use of apples, lemons, pomegranates, olive and laurel leaves, &c. (which are so essentially decorative in themselves, quite independent of archæological detail), show a veritable triumph from a decorator's point of view.

We may endeavour to unweave the web of fashions and infatuations for distinct periods, and clearly find that in all of them great truths and precious jewels of beauty were perpetuated. There is one advantage in these fashions, namely, that the close research into each period of each man's work reveals a special charm of its own. They tell the ordered story of the revelations that were vouchsafed to themselves. The horizons of their accomplishments should not, however, enfold ours; from them we may gather guidance and suggestions only, which shall increase the clearness of our mental visions in endeavours to evolve newer forms of beauty from the treasure-

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

STRAIGHT HEADS OR FLAT ARCHES.

NEARLY sixty years ago Sydney Smirke, who was afterwards a Royal Academician and professor of architecture, wrote an essay, which we are afraid is now forgotten, on the mode adopted by masons at various and distant periods in forming a straight head over an aperture. As attention is generally monopolised by arching of Eastern, Roman and Mediæval types, substitutes for lintels may appear to be obsolete, but there ought to be some interest found in arrangements of masonry which are evidence of the skill of the old builders. Mr. Smirke's observations on them are as follows:—

It was remarked by the late eminent engineer, Mr. Milne, that in his tour through the classical regions of Europe, he derived more professional benefit from an examination of the construction of ancient masonry than from any other subject that engaged his attention.

But it is not only on classic ground that this subject demands attention, nor is it upon works of the earliest antiquity alone that our examination of the artifices of construction can be advantageously bestowed. I am persuaded that if as much

NO. 1.—FROM THE TEMPLE OF CONCORD, AGRIGENTUM.

house of nature. Let not our accumulation of knowledge forge fetters to dull or stifle the creative qualities with which we may be dowered. Remember that design is not adaptation only.

When we have re-adapted, placed here, placed there, turned round and twisted in numberless ways the details of other periods, until the hackneyed forms become a weariness rather than a pleasure amongst our household gods, we may awake to the conviction that there is, in the garments of the earth, an inexhaustible mine of lovely colour and forms crying out for translation.

Why not, metaphorically, sail with the bees down the summer winds, and sip the honey of suggestions (so fraught with the seeds of creation) from a thousand flowers, from the sinuous anatomy of trees and plants, the plumage of birds, the colour harmonies of shells and autumn leaves, of moss and lichen, and the countless details of nature? If your worship of her is sincere, then will follow the clearness of vision to grasp her revelations.

I must tender my sincere thanks to Messrs. Jeffrey & Co., Messrs. Woollams & Co., Messrs. Essex & Co., and Messrs. Hayward & Sons, for their kindness in exhibiting so many beautiful examples which clearly show the premier position our English manufacturers hold in the production of this material.

attention were paid to the substantial details of structure visible in our own old buildings as has been given to the contour of mouldings and other purely ornamental forms, much light would be thrown upon the disputed chronology of these and similar works, and many data of general application might perhaps be established. This is a vein of inquiry to which I beg leave to invite the attention of intelligent and competent observers, and in the pursuit of which I think they may anticipate a profitable result.

As an example of the sort of inquiry which I have suggested, I submit some sketches explanatory of the mode adopted by masons at various and distant periods in forming a straight head over an aperture.

No. 1 is a representation, drawn from detailed memoranda taken by myself in 1825, of the lintel over the great doorway leading into the cella of the temple usually called the Temple of Concord, on the site of the ancient Agrigentum, in Sicily. The date of this building, like most of the Greek remains in that island, is unfortunately unknown; Biscari and other Sicilian antiquaries consider it to belong to a period subsequent to the Punic war, because Diodorus states all the temples of Agrigentum to have been either burnt or wholly destroyed by frequent sieges, whereas this building is remaining tolerably perfect; but this does not appear to me conclusive evidence, for although the columns, entablature and cella walls are certainly in better condition in respect to their

face and out of sight, they radiate like the joints of a skemearch: otherwise it is difficult to understand how these stones can support the weight imposed upon them; certainly the excrescences on the sides of the stones by which they are locked into each other, and which in mason's language would be called a "joggle," have but little effect in keeping them up. The face of these stones is, as you well know, richly carved, each with a separate device; they are irregular in size, the abutment stones being very dissimilar; indeed, a great want of correspondence and regularity of structure prevails throughout not only this doorway, but the whole west front of the edifice in question, and it is difficult to believe that any working drawing could have been prepared for the guidance of the masons in the execution of their work.

This fourth example brings us down to the commencement of the twelfth century, the date which I presume may be confidently assigned to the west front of Rochester Cathedral.

For the sketch No. 5 I am indebted to a friend. It is stated to be the representation of the masonry of a chimney-opening in an old kitchen at Edgcot, Northamptonshire. Although the capacious opening here shown is not covered by a straight head, as in the preceding cases, the Pointed arch which spans it is so nearly flat as to entitle it to our notice on the present occasion. I know not the age of this example, but I presume it to be of the later period of the Pointed style.

It is worthy of observation that the break or shoulder in the radiating joints is discernible in some semicircular arches at the Gothic tomb in Ravenna above referred to, and I have also noticed this singular contrivance in the engraved representations of an old building of the Pointed epoch at Cairo.

NO. 5.—CHIMNEY OPENING AT EDGCOT, NORTHAMPTONSHIRE.

The occurrence of the same peculiarity of structure in localities so distant from each other, a peculiarity unknown to Classic art, and long disused in modern art, is a curious fact, and might perhaps suggest interesting reflections; but I forbear to indulge in any speculations on this subject.

The five examples here brought into juxtaposition to show the efforts of workmen to produce the same effect with the same material, at periods and in places so widely distant, serve to illustrate the condition of the arts at their respective periods.

Nothing can exceed the beautiful precision and masterly execution of the masonry in the first, or Greek, example; its excellence is indeed sufficiently attested by the comparatively complete state of the work, notwithstanding the lapse of more than twenty centuries, the devastation of war, and the still more destructive earthquakes of which Sicily has been the scene. But art was still young, and the progress of mechanical knowledge not great; the arch was unknown, and the Greek mason had no resource but the obvious and inartificial one of forming his straight doorway with a block of depth and strength enough to bear its burden, notwithstanding the trouble that necessarily attended the process.

The second, or Roman example, has still much of the excellence that characterises the workmanship of classic times; and indicates, moreover, that since the date of the preceding example a stride had been made in the progress of the science of construction that was destined to effect a total revolution in architectural design, for cuneiform stones are here used to form a flat arch.

The third example, of what may truly be called the Gothic period, strongly marks the decadence of good art; although the masonry is executed with much precision, the rebate or shoulder in the radiating joint is a piece of mistaken construction that would not have been made in better times.

The fourth, or Norman example, and the fifth, of a still later period, illustrate that elaborately artificial manner which, both in design and construction, characterises the Mediæval architecture of Europe.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

AT the annual meeting of the Devon and Exeter Society, Mr. E. H. Harbottle presided. He told the members they had every reason to be satisfied with the work of the Society during the past year. They were now in a more satisfactory position than last year. He spoke of the pleasure which the excursions gave to the members, and referred also to various engineering movements which had taken place in recent years. The annual report stated that during the past year the work of the Society had been, regarded as a whole, satisfactory, though in certain respects an improvement was very desirable. The meetings held had been fairly attended, and all papers read were of great interest, giving rise to profitable discussions of the subjects treated on. The balance-sheet showed an increased income, but along with it a greatly increased expenditure, caused principally by the contributions towards the excursions. The Council had satisfaction in reporting that the request made for summer excursions was cordially responded to by offers to conduct the excursions, and they were consequently very successful. The Council appealed to members to do all in their power to increase the number of members, and to assist them in this way, and, by bringing under the notice of junior members of the profession the work of the Society, to make its position more thoroughly sound. The Council were also desirous of encouraging the delivery of papers by the junior as well as senior members, and felt that in such a county as Devonshire there must be many who could give a most interesting paper on matters closely allied with the profession. There was a balance in hand of 154. 9s. Colonel Appleton was elected the president for the ensuing year, Mr. J. Jerman was elected vice-president, Mr. C. J. Tait was reappointed hon. treasurer, and Mr. Edward George Warren hon. secretary.

NEW INN HALL, OXFORD.

THE building selected for examination at the first excursion of the Oxford Architectural and Historical Society was New Inn Hall. Mr. James Parker acted as *cicerone*. He said it would be impossible to carry the history, even of the site of the building, further back than the year 1349, but beginning with that year he remarked that, according to a deed preserved in the Treasury of New College, and dated April 11 in the 23rd year of Edw. III. (1349), certain lands and tenements were given by Frideswyde Pennard to John Trilleck, who was then Bishop of Hereford. On his death, November 30, 1360, he left no will, and the property passed to his brother, Thomas, who in 1364 became Bishop of Rochester, and in 1366 conveyed the land and tenements to trustees, viz. Hugh Pembridge, Roger Ottery, and Walter Brown, from whom in 1369 the tenements, &c., were purchased by the Bishop of Winchester, William of Wykeham. Wykeham had been consecrated Bishop of Winchester in 1367, and in the following year had been promoted to the office of Chancellor of the Kingdom. He had possibly before his appointment determined on founding a college at Oxford should he ever have the means, and the two appointments evidently opened up to him the opportunity of fulfilling his wish. Now the date of the purchase of Bishop Trilleck's property, according to the register in New College (if Wood's note is correct) is November 7, 43 Edw. III., i.e. November 1369, and so far as the lecturer's knowledge went, this was the first property purchased by him in Oxford. The first piece of property on the site of New College, purchased for him by his attorneys, was February 10, in the 44th year of Edward III., i.e. February 1373, or three months afterwards, namely, in the parish of St. Peter's-in-the-East, not in that of St. Peter-le-Bailey. It would be perhaps too much to argue from this fact that his first intention was to build his college on the site of Trilleck's Inn, overlooking the western wall, or rather western ditch, of Oxford, and that afterwards circumstances led him to build his college beneath the eastern wall of Oxford. The probabilities are that before building his college he foresaw that he would want accommodation for his students which he would send up from his diocese while the college was in process of erection, so that when it was completed they could enter it in a body, which they did not do till April 1386, that is, sixteen years after he bought the first plot of ground. Probably after 1386, when Wykeham's College was ready, it reverted to its former purposes, and was used as one of the inns (*Hospitia*), and was let to various tenants, first of all by the bishop himself, and afterwards by the College. From several of the college rolls it would appear that for a time some members of the Cistercian Order, or Bernardines, as they are called, occupied this inn. They had been long scattered through different inns in Oxford till Archbishop Chichele gathered them together and gave them a house in

St. Giles's, becoming eventually in 1437 (according to the letters patent then granted) St. Bernard's College (which practically continued after the Dissolution down to 1549, and was then bought by Sir Thomas White and became St. John's College). During this time, however, when the inn was occupied by the Bernardines, New College spent a good deal of money on it, especially in 8th of Henry IV. (1406), and there is a reference in the bursarial accounts (on the authority of Dr. Ingram) implying that a chapel was built for the use of the Bernardines, but he adds that no traces of it were apparent. It appears, however, by the same accounts, that some twenty years or so after the Bernardines had left in order to occupy their new abode in St. Giles's, viz. in 1460, Trilleck's Inn was entirely rebuilt by the Warden and Scholars of New College. It is probable that on this rebuilding the Hall lost the name of Trilleck's Inn, and was then called "The New Inn." Though it has been suggested that it was called so from its connection with New College, it was more probably so called because it was newly-built. John Rouse, practically a contemporary, writes:—"Trillockynne, which is now called New Inn (*Novum Hospitium*), because it has been newly-built." The principals of this hall seem at first to have succeeded each other rapidly, few staying long, and becoming principals of other halls. Further, it may be noted that at first mostly New College men seem to have been appointed. The second principal was named Eberlow, who succeeded in 1444; followed in 1445 by Wytney, of New College; in 1461 by Pavy, of New College; in 1462 by Hanington, of New College; in 1468 by Cocks, of New College; in 1469 by Hogan, and later in the year by Welsh (of what college is not to be ascertained, but probably New College); in 1484 by Dr. Lychfield, of New College, and so on to the end of the century. But it is also to be observed that from the time of Dr. Lychfield nearly all the principals had acquired a D.C.L. or at least a B.C.L. degree. Some were doctors of canon law, others of civil law, and it might with some reason be submitted that the "New Inn" had acquired a notoriety for the study of law. Several of the principals rose to high positions in Church and State, as well as in the University. John Worthiall, for instance, appointed 1514, became Archdeacon of Chichester; Dr. Barrett, 1529, became canon of King Henry VIII.'s College in Oxford; Dr. Wright, appointed later the same year, was appointed moderator of the Canon Law School in Oxford; Rowland Meyrick, appointed 1534, became chancellor of St. David's, and in 1559, on the accession of Elizabeth, bishop of Bangor. David Lewys, 1546, became the first principal of Jesus College (a college which by chance the Society had just visited that afternoon). He was fellow of All Souls, and from this date members of All Souls seem (as was pointed out to the lecturer by Professor Holland) to have had almost the monopoly of the appointments to the principalship for some forty years. New Inn Hall during the time of the Puritan ascendancy was presided over by Christopher Rogers (appointed by the Long Parliament a canon of Christ Church). At this time the hall, in conjunction with Magdalen Hall, had (according to Antony Wood) the enviable notoriety—or otherwise—of being styled the "two nests of Precisians and Puritans," and for these matters we have in Wood practically a contemporary authority, though he was then young; but he admits, as regards the number of matriculations, the hall was very flourishing. An account of considerable interest must be mentioned in connection with this period, namely, that a decree of convocation dated January 31, 1643, granted to King Charles, for the use of his mint, all the plate, silver and gilt, to be found in any of the halls, and there had been previously, December 15, 1642, a proclamation establishing a mint in Oxford, and New Inn Hall was the site chosen. Thither the several colleges sent their plate to be melted down. The subject however of the Oxford mint here is one by itself. Many points of interest are to be noted in connection with it, e.g. the peculiarities and variations of the crown-piece struck at this mint; the various contributions from the several colleges as well as halls and even from private persons (Antony Wood's plate given him by his godfather and godmother is said to have been included), the arrangements made and the moneys employed (these were sent for from Aberystwith), and other similar matters, as well as the fire which broke out "from the roasting of a pigge," which threatened the building and gave rise to a satirical poem on the subject, printed in 1656. During the time that Oxford was held by the Royalists Dr. Prior was nominated principal by the chancellor, Christopher Rogers having been apparently ejected, but he resumed his principalship in 1656 and continued to 1662, when refusing to subscribe to the Act of Uniformity, he was again ejected. After the Restoration the fortunes of the hall varied, but one name of a principal must not be overlooked, namely, the great Sir William Blackstone. It seemed as if the renown of legal studies was still attached to the hall, his two predecessors being D.C.L.'s, and his successor, Robert Chambers, who also succeeded him in the Vinerian Professorship of Law, and he in turn was succeeded by Sir William Blackstone's nephew, who was also elected

both to the principalship and the professorship. Some of the books which were seen in one of the rooms were probably those used by Blackstone. The northern half of the tenement the members would observe had been rebuilt in the Palladian style. This building was due to Dr. Cramer, principal of the hall from 1831 to 1847 and Regius Professor of Modern History. His geographical and historical works on ancient Greece, Italy and Asia Minor were once standard works. He was succeeded by Dr. Wellesley, who was succeeded by the late principal, Dr. Cornish, who died in 1887. Since then no principal has been appointed, and it is understood that the buildings have been ceded by the University Commissioners to Balliol College, who were—(and Mr. Parker said he could only tell the members what were quite open secrets)—willing to dispose of the whole buildings to the city of Oxford, but that after the report of a committee appointed to negotiate the sale, the proposal has been practically rejected. What the future of the hall will be no one can tell; apparently, it is "for sale," and after so long, and in many respects brilliant, though at times chequered, career, this was a sad ending.

SCHOOL BUILDINGS.

Bournemouth.—St. John's Schools, Boscombe, lately erected under the provisions of the Bournemouth Church School Extension scheme, have been formally opened. Accommodation is provided for 277 children. There are two floors, with schoolroom 54 feet by 18 feet, and two classrooms 15 feet by 20 feet, the rooms upstairs being the same size. The buildings were designed by Mr. Reginald G. Pinder, F.R.I.B.A., (Pinder & Fogerty), of Bournemouth. The schools were erected by Messrs. Hoare & Sons, builders, of Bournemouth, the amount of the contract being 1,535*l*. The buildings are of red brick, with ornamental tiling. The floors are laid with wood-block paving, and the heating is by hot-water pipes, each room being also fitted with a Teale grate.

Bournemouth.—St. Andrew's Schools, Malmesbury Park, lately erected under the provisions of the Bournemouth Church School Extension Scheme, have been formally opened. The buildings provide accommodation for 318 children, there being one large room 71 feet 4 inches by 22 feet, and three classrooms 24 feet 8 inches by 23 feet. The buildings were designed by Mr. Reginald G. Pinder, F.R.I.B.A. (Pinder & Fogerty), of Bournemouth, and were erected by Messrs. George & Harding, builders, of Bournemouth, whose contract for the work was 1,911*l*. The buildings are of red brick, with ornamental tiling. The floors are laid with wood-block paving, and the heating is by hot-water pipes, each room having also a Teale grate.

Bournemouth.—The schools at Pokesdown are about to be enlarged from the plans of Messrs. Pinder & Fogerty, of Bournemouth. Additional accommodation is to be provided for 93 scholars, making the total accommodation 176. Messrs. T. Head & Sons, of Boscombe, have secured the contract, which is for 550*l*.

GENERAL.

The Competition for the St. Pancras Municipal Buildings has had the following result:—The first premium of 105*l* was awarded to Mr. W. Harrison; the second premium, 52*l*. 10*s*., to Messrs. Gibson & Russell; and the third, 26*l*. 5*s*., to Messrs. Malcolm Stark & Roundtree.

The New Bridge which is about to be constructed across the Seine, between the Pont de Grenelle and the Point du Joir, will cost 2,300,000 francs. The State will pay one-half the sum and the municipality of Paris the other half.

The Oxford Convocation on Tuesday rejected the proposal to erect a fever hospital adjoining the City Hospital at Cold Harbour.

An "Old Glasgow" Exhibition, illustrating the history and social life of the city, will be held next year.

The Paris Fountains are costly sources of enjoyment. The Fontaine Saint-Michel, at the end of the "Bou Mich," is now out of repair, and a credit of 14,750 francs has had to be opened to set it working.

Dunoon Castle and grounds will be purchased for the benefit of the burgh. The price is 4,600*l*.

The Committee for the Promotion of Art and Music in Glasgow have decided to take immediate steps towards the building of the new art and music galleries in Kelyingrove Park (for which Mr. J. W. Simpson's and Mr. M. Allan's design was accepted), the funds in hand now amounting to 113,000*l*—64,000*l* of which was subscribed.

Malling Abbey has been purchased for an Anglican sisterhood, and several noblemen have headed a movement for the building of a chapel within the grounds to the memory of Rev. J. P. Dale.

The Nave of Dunblane Cathedral, which has been roofless for 300 years, has now been reopened for use, but the work of restoration is not quite completed.

The Architect.

THE WEEK.

THE competition for the hospital founded by the late Madame BOUCICAUT having failed, as the judges could not award the first prize, some of the architects who gained the remaining prizes have memorialised the Director of the Assistance Publique. They offer to take part in a second competition if it can be arranged. The commission is not unlikely to be offered to a specialist, but if a second competition takes place, it could not well be limited to the memorialists. It is also apprehended that, with the experience of the hospital before them, the authorities will, in spite of promises, decline to arrange a competition for the Opéra Comique.

THE so-called *Ambassadors* in the National Gallery is not the only portrait-group of the sixteenth century which affords an object for interminable speculation. A paper was read at the meeting of the Society of Antiquaries of Scotland on Monday which described a work that is no less puzzling. It is now in Cardiff Castle. The principal figures are supposed to be MARGARET TUDOR and the Duke of ALBANY. The lady wears a medal which is inscribed with a passage from the thirteenth chapter of Daniel, and may be taken as allegorically asserting her innocence of the charges made against her of conspiring to procure a divorce from her husband in order to marry ALBANY. A carnation and a butterfly are also introduced. A subordinate figure that points to the latter is assumed to be an English herald, who came to Edinburgh with letters from the English Court. At one time it was believed that the painter was HOLBEIN, but it is now considered more probable that he was a contemporary artist who came to Scotland with the English herald. Sheriff MACKAY, who has been investigating the subject, concludes that the painting was likely to have been executed between February 1 and 14, 1522. If so, it could not be HOLBEIN's work, for he did not arrive in England until 1526. The picture is also assumed to have some relation to an event which occurred in Edinburgh. The Marquis of BUTE's mysterious portraits seem to be as worthy of discussion as the *Ambassadors*.

THERE is no doubt that two competitions will be held before a design for the new Munich Museum is selected. That has been the decision of the Special Commission, although the conditions of the contest are not completely formulated. Sketch designs will be sent in for the first competition, and the authors of a number of them, to be fixed hereafter, will take part in the second competition, which is expected to furnish a suitable design. But as at every step there must be consultations between Government officials, it may be doubted if the issue will be decided this year. The Bavarian builders, who are not accustomed to competitions, will no doubt grumble at the delay, for we believe an official design could be put into execution at the beginning of the summer.

THE Municipal Council of Paris may not be considered to be a model administration, but the Ordnance Department might with advantage take a lesson at the Hôtel de Ville upon the production and publication of plans. How few people in London know anything about the agents for ordnance plans. The maps of Paris are sold at the Hôtel de Ville, with which every citizen is familiar. The official plans have just been completed or revised on different scales. One plan on the scale 1-10,000th, which is nearly equivalent to the English 6 inches to the mile survey, takes in part of the suburbs, including the Bois de Boulogne and the Bois de Vincennes. There are a variety of plans which have been produced by the combining lithography with engraving, and it would not be expensive to produce maps of the city to meet special purposes whenever they are called for. The citizens can also be supplied with maps of the various arrondissements at a fraction of the cost of the general plan.

WE have more than once referred to the design which the late M. MEISSONIER had prepared for the decoration of the Panthéon of Paris. Wall-painting was not suited to his abilities, and for the sake of his reputation it was well he had not carried out his commission. M. MEISSONIER left a design, a sort of allegorical triumph of Paris, and there was a proposal to have it executed by another hand. But the scheme seems to have collapsed. M. DUPUY, the present holder of the portfolio of Minister of Public Instruction and Fine Arts, has decided to entrust the painting of the vacant space to M. PUVIS DE CHAVANNES. The selection is wise, and indeed many regret that the artist was not persuaded to paint the whole of the walls. He alone has had the courage to suggest that decoration was inferior to architecture, and the white stone pilasters that separate his paintings do not appear weak like those which are near some of the remaining paintings. We have already published illustrations of M. PUVIS DE CHAVANNES's unique series in the Panthéon.

THE contest between the Edinburgh Corporation and the North British Railway Company has advanced another stage. We have already stated how the Corporation would not grant a conveyance of the strips of the Princes Street Gardens unless the Company, in addition to paying 26,500*l.*, agreed that the servitudes of the owners of property should not be prejudiced, or in other words, undertook the whole responsibility for any actions that might be raised. The case was heard by Lord Low. The obnoxious clause was the following:—"Nothing herein contained shall prejudice the existing rights of servitude or other rights, if any, of the vassals of the Corporation of Edinburgh in virtue of their title-deeds." The Corporation maintained that they were not bound to convey to the Railway Company a greater or higher right in the lands than that which they were authorised by the Act of Parliament to take. The judge considered that if the land was subject to servitudes, he could not see how it could be used for railway purposes. He proposed that there should be, however, a declaration that the conveyance was granted under the conditions, provisions and restrictions in the Railway Companies' Act, leaving it to be decided what was the extent of that Act. It is, therefore, safe to conclude that a good many actions will arise out of the sale of the strips, but whether the defendants will be the Railway Company or the Corporation or both remains to be seen. The owners of some of the houses in Princes Street possess rights which will be affected by the contemplated works, and they can hardly be considered Scotchmen unless they seek compensation.

THE Commissioners for Public Baths and Washhouses in the parish of Chelsea announce that they have under consideration the designs, together with the specifications, submitted to them in connection with the competition for baths and washhouses at Kensal Town, and that they have determined upon the designs for which the premiums agreed upon will be given. The designs will be open to inspection by the public at the upper hall of the Town Hall, Chelsea, from Monday, March 27, to Saturday, April 8; and at the Parochial Offices, Kensal Road, from Tuesday, April 11, to Tuesday, April 18, from 10 A.M. to 5 P.M. No mottoes or names are yet known to the Commissioners, the designs being numbered only.

THE Commissioners for Public Baths and Washhouses for the parish of St. John at Hackney invited seven architects to compete for buildings to be used for public baths, offering premiums for the three selected designs. It was understood that the premium in the case of the architect employed to carry out the work would merge into the commission of 5 per cent. Ten sets of designs were submitted. The Commissioners, with the assistance of their professional adviser, Mr. T. THORNTON GREEN, unanimously selected the design bearing the motto "Compact," Scheme A, by Messrs. HARNOR & PINCHES, Adelphi, for the first premium. The design "Otter" (Mr. F. J. SMITH, Westminster) was awarded the second premium, and the design "Practical" (Messrs. SPALDING & CROSS, Queen Street, E.C.) the third premium.

THE ASSOCIATION SKETCH-BOOK.

IF the Sketch-book of the Architectural Association could be withheld from criticism in journals, and in other ways treated unlike the ordinary works which publishers place in the market, it would be an advantage to those who have most interest in its production. It is essentially a student's work, and it ought to be the expression of the fascination which certain buildings exert upon the minds of the draughtsmen. To be competent to measure and to draw a building with accuracy, or to represent its general effect, are victories which ought to gratify not only a young fellow and his friends, but other youths of his age and standing. The publication of his drawings becomes a record of his competence at the time, and will be an aid to test his progress at a later period. It is not necessary for such a purpose that out-of-the-way buildings should be sought, or even that the repetition of drawings of any building should be avoided. The primary purpose of the drawings is a display of draughtsmanship, and it is not necessary that the subjects should be helpful to practising architects, or that the execution should be up to the standard of the leading offices. When, however, the collection of sketches is made a marketable commodity the character of the drawings must be regarded under new conditions. They have to be attractive to men who care little about the authors or the Association, and who will only invest their guineas in drawings that can be turned to account. There is consequently a risk that drawings which are produced by students in the ordinary sense of the word will have to be set aside to find space for drawings by men who can claim to be architects.

Another disadvantage arises from the difficulty of testing the degree of advancement in architectural drawing. The plates in the early volumes were drawn of the exact size on transfer paper. There was more or less difficulty for a novice in using paper, pens and ink which were strange to him, and if he attempted much detail he was not likely to succeed at the first trial. But the exercise was beneficial and the plates could be produced very cheaply. Of late years the task of the contributors is simplified. They have only to make drawings with pen or brush on paper in the ordinary way on a scale that is convenient to them, and the drawings will be reproduced by one or other of the photographic processes. There is no doubt that the results appear more pleasing, but the plates are less gratifying as evidence of resolution in overcoming obstacles. In fact, the Sketch-book corresponds with the change in the character of the Association. It may now appear to be more of a collegiate body; it has its professors and lecturers, a syllabus and scholarships. But there is no longer the old self-reliance. If, too, the Sketch-book has become a portfolio of drawings which may safely be submitted to young ladies for approval and to practitioners for cribbing, much of the credit for attaining such ends is to be ascribed to processes that are mechanical. Every year the co-operation of men who are outside the Association becomes more needful, and it is the business of the editors, as well as other officers, of the Association to do all they can by mute appeals as well as by words to excite sympathy. It is not possible for the Association to enjoy the privilege of being the very obedient humble servant and purveyor to the Institute on other conditions.

If we consider the plates irrespective of their relation to the Association, they must be acknowledged, from the subjects as well as the execution, to be an interesting and useful collection. Mr. A. B. PITE furnishes the title-page. It is an architectural dream, which should delight the College of Masonry by its vaulting, arching and display of curved lines. The first plate is by Mr. KOTARO SAKURAI—a view of Barrington Court, Somersetshire, which is freely drawn. There is no fear of unshaded space, and the parts where light does not fall are not excessively dark. Mr. SAKURAI's plate of the west door of Salisbury Cathedral is from a washed drawing, and shows a desire to express the leading lines faithfully. It is remarkable to find that the foliage of the capitals appears to puzzle him, although we might suppose that any work having a floral origin would come easy to him. Mr. A. N. PATTERSON's Stanley Place, Chester, is freely drawn and there is measured detail. The lines of his details of the ambo at San Clement's, Rome, appear to

have been drawn with a fine brush. A fourth plate is the sarcophagus of FREDERIC II. at Palermo. Mr. GIMSON shows a fine doorway from Durham, and gives sections of the mouldings. It is from a pencil drawing. His figures from Laon and Rouen show appreciation of comic as well as serious sculpture. Mr. NEEDHAM WILSON has only one drawing, a very delicate view of Ely Cathedral. If he had drawn directly on the stone he would have produced a more satisfactory plate. The process which the late TALBOT BURY so well utilised (to say nothing of PROUT, HARDING and other pictorial artists) should not be allowed to become one of the lost arts. It seems peculiarly adapted to express the effect of buildings, for it can become more suggestive of detail than brush-work, and does not lend itself to random strokes like etching. Mr. E. S. CUMMINGS supplies measured details from Granton, Ely, &c., and as they are dated we can observe his progress. Mr. T. MACLAREN has selected the tower of Evercreech Church, the screen of High Ham Church and a pulpit in Lucca, the last being an exquisite example of the application of ornament. Mr. E. A. RICKARDS's ironwork from Abbott's Hospital, Guildford, and especially the latch, presents some curious appliances, but however obsolete they were not irrational. More interest will probably be excited by his woodwork from Whittington Chambers, College Hill, which is not unworthy of WREN's supervision, and the pulpit in All Hallows Barking Church, Great Tower Street, which dates from 1613, with a "hedd" which was put up in 1638 at a cost of 18*l*. A fourth drawing shows some of the panelling from the Hôtel de Ville in Oudenarde. Mr. WALTON sketches the north-west porch of Hereford Cathedral in freehand lines which were, we suppose, etched over ruled lines. The font from Hitchin Church must have been handsome. It was surrounded by figures of the Apostles cut out of the solid stone, and there were no less than four varieties of crockets used in connection with the canopies.

Mr. W. H. BIDLAKE's drawing of the Swan Inn at Knowle appears to have been drawn on transfer paper, and shows a very successful example of the search after the picturesque by the old builders. Evidently there was a belief in the advantage of variety in Knowle. Mr. BIDLAKE's Gateway of Maxstoke might be taken for a reproduction of a lithograph in crayon from his hand; he also would find an advantage in working on stone and would thus escape the flatness of photography. Mr. DODS has a geometrical drawing in clear and uniform lines of a doorway from Carey Street, but he is not quite as successful in dealing with the large curves of some Italian ironwork in the South Kensington Museum. The series of sections of mouldings from Westminster Abbey, by Mr. S. VACHER and Mr. W. G. B. LEWIS, are very valuable, but where are the eyes competent to read the lettering on Plate 18? Evidently the original drawing is most elaborate, but it was not prepared for reproduction by photography, and the writing is therefore illegible. The failure should be enough to convince the editors of the necessity for returning to the original system of drawing on transfer paper. The stalls in the Henry VII. Chapel, which are not sufficiently noticed, have afforded Mr. KITSELL materials for one of the most interesting of the plates. The interlaced ornament is suggestive. Mr. A. N. WILSON supplies several good bits in his "Sheet of Metal Work." The Jews' Hospital, and transept of St. Nicholas in Newcastle-on-Tyne, are not drawn in a commendable style by Mr. W. H. KNOWLES, and the editors ought to be firm against the admission of hurlyburlys of this sort. It is quite evident the sketches were traced from originals that were careful in their lines, and out of affectation the copies were made to assume a slap-dash character as if they were the work of minutes. Unless we are mistaken, Mr. HART's four drawings from Oxford would not give the disagreeable impression of the plates. Two are printed in a hard grey, and the others are like washed-out pencil sketches. There were apparently artistic touches throughout, but the alchemy of the sun was not favourable to them.

The five drawings, dated 1885, of St. Patrick's Church, Patrinton, "the Queen of Holderness," by Mr. W. J. TAPPER, are of the class which should be more often exemplified in the collection. They are not showy, and the author would have done better if he left out the scratches which are supposed to impart effect, but young students would

be better employed in reverential but mechanical measuring and geometrical drawing than in trying to astonish the world with realisations that are supposed to be instantaneous. Mr. BANKART prefers domestic work, and the three houses at Salisbury and Shrewsbury are picturesque representatives of three styles; the reproduction of one is unpleasantly smudged. The specimens of metalwork from the Lake House Collection were difficult to draw, and the plate by itself is almost enough to suggest that the late Mr. W. MEDLYCOTT DUKE would have one day gained reputation as an artist. Dalmeny Church, near Edinburgh, is a small Norman building, and deserved to have a better view than Mr. W. N. CUMMING condescends to give. Time must be money in the North when only opportunity for such a scrawl can be afforded. Of another character are Mr. JOHN BEGGS's two plates from Dunblane Cathedral from which many more could be derived, and one of the plates of Jedburgh. But the perspective sketch of the latter is as pretentious in its roughness and incompleteness as any of the English experiments. Kellie Castle, by Mr. R. S. LORIMER, is another of the satisfactory sets. Neither geometrical nor freehand views are perfect, but we can see that his ideas were clear, and that when sketching he did not forget his measurements.

The drawings by Mr. SCHULTZ would serve as models to be adopted by future contributors. All the parts in the mosaic floor in HADRIAN'S Stoa, Athens so well agree that they impress us with a conviction of their fidelity to the original. The same effect is produced by his sketches of the stoups from Florence and Venice, and the noble capitals from St. Mark's, Venice. It will be evident to anyone who studies the drawings that although Mr. SCHULTZ finds no difficulty in dealing with intricate detail or subtle curves, he does not despise the aid of ruled lines in much of the shading. They are, however, so well managed that they do not strike us as mechanical, and they seem to make the most fitting ground to heighten the effect of the elaborate capitals. Mr. SELBY has a sketch of a part of a painted window in Florence, which, from its correspondence with parts of the Vatican Loggia, appears to be the work of GIOVANNI DA UDINE. Two difficult subjects from Florence have been creditably treated by Mr. SHACKLE, viz. a relief on the tomb of St. ZENOBIOUS in the Duomo and the group of dancing children, both by DONATELLO. Mr. MASEY has taken some refined ornament from tombstones in St. Croce. Mr. LANCHESTER suggests the disposition of the band of angels in St. Eustorgio, Milan, and has boldly attempted a very difficult task, viz. to represent the interior of the cathedral of Siena. The collection comes to an end with two Spanish subjects by Mr. PRENTICE, a staircase at Burgos and a screen at Seville, which may, we suppose, be taken as indications of his forthcoming book. He has also a view of the basilica of St. Clement at Rome, which ecclesiologists prefer to St. Peter's. Undoubtedly the editors have contrived to supply much that is valuable to their subscribers. Whether the collection is a fair exponent of the draughtsmanship of the students of the Association may, however, be doubted.

THE INSTITUTE OF WATER-COLOUR PAINTERS.

IN spite of their defects of arrangement and lighting the galleries of the Institute of Painters in Water-Colours from their size allow the Council to show hospitality to many artists who are outsiders, and also to inspire experiments. As the sole aim of the latter is to produce effects that will be striking at a distance, it is not certain that much advantage arises to water-colour art. If the galleries were used for an exhibition of drawings by the men whose memories are held in reverence, we might safely predict that not even TURNER's masterpieces would be able to assert themselves on the walls of the Piccadilly building. Soon after the divagations began, EDMOND ABOUT said finely, "When I see water-colour art attempt to employ strong colours and aim at grand effects, I imagine that I have met a young and pretty *pensionnaire* who has fled from her convent in the habits of a mousquetaire." If we were able to criticise the drawings which are to be seen at the Institute, he could devise a stronger contrast to suggest the tendencies. But are the artists to

be blamed? With extensive galleries which are fitted not only for the exhibition of oil-paintings, but for all sorts of assemblies, they are compelled to work up their drawings, or they will be neglected. The drawings, if purchased, will generally be hung in rooms that would be reckoned small if compared with the Piccadilly galleries, but who can care about the future when he remembers that his immediate business is to produce something that will assert itself amidst seven hundred claimants for attention? We might say that nobody can occupy a very prominent position on the walls of the Institute without sacrificing some of the most desirable qualities of the art, and we therefore advise visitors who are in search of drawings in which some reverence for the old traditions are visible to examine those which are nearest the floor. It is astonishing how many works that are excellent have to be relegated every year to that level. The bigness and the banality of the rooms make it indispensable to have many works that are astonishing by their vigour rather than by delicacy predominating upon the remaining parts of the walls.

The most startling example this year is probably the *Sleep* of Mr. R. FOWLER, of Liverpool. The girl who lies so quietly among the poppies is as large as life, and therefore the mere dimensions of the drawing are enough to raise wonder. It was of course necessary to employ only opaque colours in order to gain effect; but on the whole the drawing is as subdued as an old fresco, and the colouring which suggests that the red of the poppy was employed to convert blues into purples is well adapted to the subject. But the artist could hardly do justice to such a *sonsie quean* with the process of water-colour drawing, and we recognise the skill which grappled with the difficulty; but a more successful, if less remarkable, work would have been produced in oils. The *Portia* of another Lancashire artist, Mr. SMETHAM-JONES, is a half-length of life-size. The mass of crimson in the doctor's gown at once seizes attention, and diverts it not only from the characteristic head of SHYLOCK in the background, but from the girl's own head, which is of a pleasing type. We suppose PORTIA is addressing BASSANIO, but at that moment in the play she did not possess the bond which is seen in the drawing. Mr. ST. GEORGE HARE has expended much toil in his *Melodious Musing*, a girl of Spanish type lying on her back and touching a guitar. It is no easy task to treat such a figure, especially in water-colours, but the coarseness of the features is likely to compel people to overlook the power that is seen in the modelling. Mr. RHEAM, in *Spells*, has worked out effects by means of various blues, and a comparison of the drawing with those near it reveals that a very limited palette need not involve much self-denial. But it is to be hoped Mr. RHEAM is not about to add to the ravens at the Institute. Those ominous birds have been too long a bore in the exhibitions. Mr. WEATHERHEAD has one of his simple but pleasing figures, the *Skipper's Wife*; the woman stands near a small window which casts light on her red jacket. Mr. J. W. FORSTER'S *Dryads* is decorative in arrangement, the figures being in white robes. There is timidity in the treatment, and the artist was not thinking of the antique. Mr. AUSTIN BROWN in his *New Bedding* repeats a subject which has already gained success, and with reason, for it is not within every animal-painter's powers to impart interest to a scene in a cowhouse, and make a girl act as a herd without appearing degraded, for the white calf with the brown spots is the principal figure. In a different style is the gipsy-camp at night, *Wanderers*, and excellent in its technique. Mr. GORDON BROWNE has had too much practice as an illustrator of journals and books to neglect making the most of a dramatic scene. Although the figures are vigorous enough in the *Press Gang* and the sailors are good-humoured in their struggle with the landsman—there are five against one—the scene does not appear as true to life. We prefer *Surprised*, a band of primitive cavalry attacked in a defile by invisible opponents, who cast down stones upon them. In this the unexpectedness of the attack and the inability to deal with it are well suggested. A contest as interesting to the spectators as *Sword v. Bayonet* is the subject of Mr. F. M. EVANS'S *Passage of Arms*; the girl with her broom is opposed to a man-of-war's man with a single-stick, and, accident aiding, is not unlikely to win. The contest takes place in an old-fashioned panelled room,

and a group in the background await the issue. As the sailor wears duck he appears more of a match for the girl in light cotton than if he appeared in a serge jacket. The scene is one which appeals to all classes, and the drawing is likely to be the most admired in the exhibition. Commonplace as may be the characters in it, they are preferable to the highwaymen that are fast becoming a specialty in Institute exhibitions.

The President is always chary of occupying much space, and this year his two portraits of ladies and the head called *Anthea*, from their size, run the risk of being overlooked. Flesh and costume are admirably painted, but is it the consequence of seeking so much after solidity in the former that the hair is handled so heavily? Mr. C. GREEN'S *Sir Roger de Coverley* is as careful in execution as any of his past works, and the line of girls is very graceful and English. LEECH could hardly put "Mr. BRIGGS" in a more humorous predicament than is seen in Mr. A. C. CORBOULD'S *A Man's as Young as he Feels*—a heavy-weight pursuing a hunter across a field. Mr. CARLTON SMITH'S *Coming from the Well* has a background of trees that is as delightful as the figure of the girl who so gracefully carries the pitcher. It is the most successful of his three drawings. Mr. EDGAR BUNDY in *Memories* represents an ancient dame—a sort of Countess of DESMOND—seated in a gallery contemplating the family portraits, which are of the stereotyped class. The idea is realised without any straining after effect. There is nothing introduced that would disturb the reverie, and the light which falls on the face seems like an influence which quickens the brain and recalls the past. *Cordelia's Banishment*, by Mr. G. SHERIDAN KNOWLES, might be a representation of a *tableau vivant* at the Institute. It is skilfully arranged, and the characters exhibit the most decorous self-control. But this drawing-room scene has no relation to semi-barbarous Court, and who could imagine the nice old gentleman on the throne had uttered the dread command, "Begone without our grace, our love, our benison"? Mr. A. M. ROSS'S *Music Lesson*—a very large drawing of a girl with a dog before a piano—is undoubtedly very vigorous, but if prepared for any other exhibition it would probably appear on paper one-fourth the size. Mr. STEER'S *Poor Lad*, which suggests the commiseration of villagers for a boy who has met with an accident and is escorted from the surgeon, is curiously real, but not in the French sense. The same love of detail is seen in the trees and ground of the *Touchstone and Audrey*. Mr. DUDLEY HARDY'S *Study in Petticoat Lane* might be a scene in a remote Judenstrasse or Ghetto, and is as telling as if painted in oils.

There are several fine landscapes this year. The single contribution by Mr. B. EVANS, *The Valley of the Wharfe from the Bolton Abbey Moors, Yorkshire*, is a characteristic rendering of as glorious a scene as is to be found in England. The peculiarity of the place is expressed, and the drawing imparts a sense of air and light of an autumn day. Mr. ORROCK'S *Smailholm Tower* is a puzzle. The tower is about as interesting as a builder's pay-box on wheels, but it is represented on so large a scale and stands forth so prominently that we must imagine the painter has had some special motive in selecting so strange a subject. There is a fascination about bewilderment, and the visitor is sure to look more than once on Smailholm Tower, and to wonder why it inspired so big a drawing. The view of *Edinburgh from the Braid Hills* proves that Mr. ORROCK can see an amount of colour in the North that will surprise people who are well acquainted with the scene. Mr. HARGITT has derived three capital subjects from that *multum in parvo* for landscapists, the Isle of Arran. The sombre *Cairn ne Calliach*, and *Black Hill*, and the *Hill Stream* (for the pyramidal rock in the background, we presume, was found in Arran) reveal his skill in painting mountains, and which is not sufficiently appreciated. Mr. FRANK DILLON has a good view of the priory garden at Dunster with its large dove-house. Sussex has, as usual, supplied many of the landscape subjects; in fact more than any of the other counties. One of the best is Mr. A. W. WEEDON'S *Stacking Hay, near Pulborough*, an inland region that is not yet exhausted. The view of Bosham is more varied in its elements. Another view that is worth notice is Mr. WHYMPER'S *In the Quell*. Mr. H. G. HINE continues that series of scenes which never pall on the public mind. His

Beachy Head, Seaford Cliff, and *Lewes* are as faithful to Sussex as any of their numerous predecessors. There is, however, more glow and colour in the view of *Thirlwall Castle, Northumberland*. Mr. JOSEPH KNIGHT'S landscapes do not need much search, for they can be quickly identified. His *Across the Warren* and *Evening Light* could hardly be more effective if they were in coloured relief.

The power possessed by Mr. GREGORY, A.R.A., exasperates rather than gratifies his admirers. The painter of the small *Peveril Point* under other conditions could produce glorious landscapes, for the rocky coast and sea in it are not easily forgotten. But it is not unlikely that years will elapse before we have another chance to admire a seascape or landscape by the artist.

In the east gallery some of the so-called strongest landscapes are hung. Mr. COCKRAM'S *Still Salt Pool* has much originality about the disposition of the parts. Mr. E. G. WARREN'S *Silent Woods* contains many noble trees. Mr. CLAUDE HAYES'S *Winter's Eve* and *Winter*, like his other drawings in the exhibition, are not composed on principles that are generally accepted. They might be imagined to be accidental combinations owing to the care with which the planning is concealed, and the handling, which is so light that it appears very easy work. His drawings are suggestive rather than imitative, and somehow they are unlike any others in the galleries. We do not advise a novice to attempt an imitation of them, for without peculiar skill he is likely to produce something that might well be called an "assemblage confus de l'être et du néant." Mr. NISBET, of Edinburgh, in his *Harrowing*, occupies at least three-fourths of the canvas with sky, and the picture gains by the treatment. His *Moonlit Moorland*, on the other hand, is only sufficiently lighted to make dimly visible the waste and moostroopers who cross it. Mr. P. MITCHELL'S landscapes show no falling-off this year, and, in fact, the delicate treatment is manifest at a glance. Mr. J. NASH, in his *Derelict*, adopts a method that might be considered as opposed to STANFIELD'S in the *Abandoned*. The sea is of the peculiar blue which Mr. H. MOORE loves, but which is not everywhere a characteristic of salt water. The sky is also bright. No doubt it was intended to make the wreck appear more pathetic when seen in the brilliance of a summer day; but whether owing to the influence of tradition or other cause, it seems to us that the old-fashioned way of suggesting the wreck as helpless under a power that was inimical was preferable. TURNER'S *Téméraire* also supports our theory. The sea is calm, and there is a glorious sun, but the noble veteran appears as helpless as if out of its element, for it is dragged as if in triumph by a tug that seems to be the representative of ignominious force.

Views of Venice are numerous this year. Mr. FULLEY-LOVE has no less than eight in which the buildings are shown in a straightforward style, as if their quality was sufficient to secure admiration with the aid of extraordinary effects of colour or dramatic figures. Mr. HARRY HINE has a large view of Durham, which suggests the extent and strength of the buildings; another of Gloucester Cathedral, which is brilliant, and one of Norwich Cathedral, in which the tiled roofs of the neighbouring houses detract from the interest of the building. Mr. A. W. RIMINGTON selects that gateway of the Doges' Palace which seems to be indispensable for all exhibitions in England and abroad. Mr. T. R. MACQUOID'S *Great Square, Carthagera*, is almost refreshing from its novelty, and it is needless to say it is drawn with an appreciation of detail. *A Shoemaker's Window, Arramanches*, is curious, but the *Stable Yard, Normandy*, is prosaic in itself and owes its interest to the mode of representation. Mr. C. EARLE has a view of Stokesay Castle, which can be contrasted with one by Mr. WHYMPER, and a remarkable view of Avignon. Mr. PHENÉ SPIERS'S careful *Street in Hameln* (the scene of the Pied Piper's retributive vengeance) and part of the castle at Heidelberg have interest for others besides architects. Mr. B. DANYELL represents the *Bargello Steps* in Florence. Mr. E. BALE has a couple of views in the neighbourhood of Florence. Mr. HAY depicts the *Belfry of Bruges* more darkly than it appears of a wet day. The formal *Old Workhouse, Chichester*, is drawn by Mr. COULDERY, and when compared with modern buildings of its class gives rise to doubts about social and economical progress.

ST. JOHN, SYRACUSE.

THERE is outside the walls of the city of Syracuse a small church of high antiquity dedicated to St. John. It has been built over a still more ancient place of worship, being a subterranean chapel or crypt, which there is reason to believe was one of those caves resorted to by the early Christians for the celebration of their forbidden rites, when harassed by pagan persecution. Pirro, in his "Sicilia Sacra," relates that in anno Sal. 59 St. Paul stayed three days at Syracuse, where he was received with incredible joy by St. Martianus, the first bishop of that city. According to a tradition, during his sojourn there he dwelt in a cavern which is under the very ancient church of St. John, outside the city walls, and which, it is to be presumed, is the crypt of which a view is given. Pirro adds that Martianus afterwards suffered martyrdom, and was buried in this subterranean part of the church of St. John. The details of early church history which are given by old ecclesiastical writers are often too dependent on tradition to justify their reception as facts. In the present case, however, they certainly afford presumptive evidence of the great antiquity of this crypt, evidence strongly borne out by the existing remains.

It therefore appears that the lower cross, that carved on the corbel, is to be considered as one of the signs of the original consecration of the church. In a Pontifical printed at Rome in 1595, and now preserved in the British Museum, where the ceremony of consecrating a church is set forth at length, the bishop is enjoined to mark with his thumb, dipped in the chrism, twelve crosses on the walls of the church and others on the door, altar, &c. The prints embellishing this Pontifical show the bishop so engaged, mounted on a movable stage six steps high, the rubric requiring that the crosses shall be 10 palms (7 feet 5 inches English measure) above the floor.

On the exterior of this church is a sort of entablature over the door, on which is a rude representation of Doric triglyphs with a cross in the metopes; over this entablature is the strange anomaly of a Pointed arch. The artists of Italy in the Middle Ages seem to have been sadly puzzled in their style; they were so much accustomed to see around them the examples of Classic art, then, of course, much more numerous and perfect than at present, that they came unwillingly, and therefore awkwardly, into the new style, and were the first to apply themselves to the renewed study of the style of their forefathers.

There is nothing else particularly to be remarked in the

SUBTERRANEAN CHAPEL IN CHURCH OF ST. JOHN, SYRACUSE.

It is obvious, from the view of the crypt, that there is much variety in the dates of the several parts. The plain semi-circular vaults forming the ceiling, although repaired subsequently, may be supposed to be the earliest; the ribbed and pointed vaulting beyond is decidedly posterior, and in the foreground of the sketch are a few indications of modern work. It will be observed there are some stones carved in almost Classic style, which form part of the piers supporting the vaulted roof, and which, from the manner they appear let into the wall, must have belonged to some previously existing work of, however, Christian builders, for there is carved on one stone an eagle with the nimbus round its head, which bird, as the lion was the representative of St. Mark, appears to have been the emblem of St. John the Evangelist, to whom this spot is dedicated. On another piece of sculpture are seen two smaller birds amidst foliage, which may have been intended to represent doves, symbols of Christian love, often seen upon monuments of the earliest ages of Christianity.

The plain cross cut on the face of the corbel on the left hand is peculiarly interesting; near to it is an inscription, of no great antiquity, to the following effect:—"Crux superior recens cæteræ vero antiquiores sunt, et antiquissimi consecrationis signa referunt templi hujus, quo non habet tota Sicilia aliud antiquius."

exterior of St. John's, except the enriched rose-windows, a form of window frequently met with in the architecture of the Middle Ages throughout Italy.

JAPANESE ARCHITECTURE AT CHICAGO.

ONE of the great benefits to be derived (writes Mr. P. B. Wight in the *Inland Architect*) by the city of Chicago from the World's Columbian Exposition will be a permanent building (or rather group of buildings) now being erected at Jackson Park by the Japanese Imperial Commission, illustrating not only the old architecture of Japan, but the exact method of construction employed in that country during the best periods of its arts, ranging from four hundred to eight hundred years ago, according to some authorities. For it is held as well by modern Japanese experts no less than by connoisseurs who have made a study of the architecture and decoration of that wonderful country, that its greatest development in this direction was during the period mentioned, corresponding with the later Byzantine and Romanesque and the earlier Mediæval periods in Europe.

The modern buildings of Japan—that is, those erected before commercial relations were opened with America and

Europe in the present century—beautiful and exquisitely constructed as they may appear to our eyes, are not considered by the Japanese themselves to be examples of an indigenous style. All modern building in Japan has been subjected to a Chinese, and possibly a Korean, influence. I am assured by the Japanese Commission that the buildings erected by them on the Centennial grounds at Philadelphia in 1876 were of this character. Those who saw them will remember the solid construction, perfect fitting and artistic carvings of these buildings, which were then greatly admired. But it has been the desire of the present Commission to illustrate the architecture of Japan as practised in its "palmy days." Not only the methods of building, but the style of decoration employed at that time, are now subjects of study in the Imperial Academy of Fine Arts at Tokyo. This Academy, which, when founded, was devoted to studying the arts of modern Europe, has found a mine of wealth in its own country, and the fear that was expressed by lovers of Japanese art in America and Europe, that the Japanese might discourage their own arts by endeavouring to import those which are not indigenous to them has been dispelled. These buildings will be built to demonstrate this fact.

The construction work is being done by the most skilful mechanics that could be found in Japan. All the material has been worked and fitted during the past summer, and has been transported to Chicago at great expense. It could have been taken the entire distance by sea to New York and then sent by rail to Chicago for less than it has cost to bring it by the direct route by steamer to San Francisco, and thence by rail to its destination. But time in this case was more important than economy in money. The buildings will be completed and decorated in time for the opening of the Exposition. Hundreds of men have worked on them in Japan during several months past, and all the parts have been accurately fitted together, so that only twenty-four men are required to perform the actual construction. Soon a larger force of artists and decorators will come to complete the work, and gardeners will surround the palace with wonders of horticultural art, the result of the traditions and experience of a thousand years, handed down from father to son.

The work of decoration will be performed by the students of the Academy of Fine Arts of Tokyo. It is well known that the excellence of all the arts practised by the Japanese is due to the fact that all trades and arts are hereditary, and shopwork is hardly known; but artists work in that country singly and in their own homes where the sons learn their art from the fathers. Such men are not archæologists. It is nothing to them what the ancients did. But they know that what their fathers did was well done, and they are content to do it again as well or better if possible. When the old decorations became matters of study in the Academy, there were no artists to reproduce them in the old way, and the hereditary artists (so to speak) would have botched them in attempts at reproduction. Hence the students and graduates have undertaken to execute the decorations of the interior of the palace. Many of them are on panels, and have already been completed in Japan.

The whole of the work is being carried out under the direction of Mr. Kuru, of Tokyo, a graduate of the Imperial University of Japan, who has practised architecture in his own country for several years, much as our own architects do, and now comes to America for the first time. Mr. Kuru is also an artist in many other ways. In Japan the practice of architecture as a profession is of course something new. Japanese buildings in the indigenous styles required no architects. Builders in Japan, like potters and metal workers, are born to the trade, which they inherit from their fathers. They are draughtsmen and designers, in their own way, as much as they are contractors. But the changes in customs and government have called for buildings more like those of America and Europe. Hence educated native architects have been called into being. Mr. Kuru, when at home, is engaged mainly in designing government school buildings.

In addition to the palace on the wooded island, he will have charge of the erection of the Japanese Tea House, east of the Manufactures building and fronting the beach, the materials for which have all been prepared and are now on the way from Japan. He is now preparing in Chicago the designs and working drawings for the Bazaar, which is to be built on the Midway Plaisance. This will be built in the modern Japanese style. The materials will not be sent from Japan, but our own materials will be worked into it by Japanese mechanics as soon as the palace is well under way.

Meanwhile the happy group of imported workmen are putting their materials together on the island, making hardly a sound with their work—for there are but few nails in this building—but making the park resound with their happy songs. Happy and contented are they, though they be contract labourers, and have no unions behind them nor walking delegates and committees to rob them. And they are literally "imported contract labourers," yet whom no meddling labour agitators with jealous eye can disturb or make afraid, for Congress has made an exception of men working for foreign

governments at the Columbian Exposition, and the Secretary of the Treasury has said that it is all right. They work and talk and sing. When a few are together they talk incessantly. When many work together on some laborious undertaking they chant wild songs something like those of our sailors. I am told that they are comic songs and witty sayings. These stimulate them to greater exertions. They laugh at each other's jokes, unmindful of all else that surrounds them, and are happy. They are doing the work of their brilliant emperor whom they love, and are contented. They comprise all the classes of craftsmen that work on buildings, and labourers as well. If the labourers want help, the tradesmen take hold without violence to their dignity and perform menial work without complaint. Their stonemasons work without chisels, doing all kinds of work with a great variety of hammers having edges as sharp as knives and a ring that attests the fine quality of the steel. I saw a solitary old stonemason, who had been employed to help them break up stones with plug and feather, but not to cut. They did all of that with their little hammers. He was a union man, and I wondered if they came into his category as "scabs"; or was he innocent of the thought that these men worked at his own trade, and that association with them subjected him to severe penalties?

But let us return to the story of how and why this ancient palace comes to us from afar. From an architectural standpoint it is perhaps the most interesting contribution to the Exposition. For it is not set up as an imitation, but is what it pretends to be, a genuine product of materials and labour that has never before been seen on this continent.

The general plan of the exhibit was determined by the Imperial Commission, after studying the ground and preparing many sketches. It was finally decided to erect a palace such as those occupied by the Shoguns of the Mediæval period and to use three types, following the designs of ancient buildings, now existing and combining them into a general plan which would comprise a body and two wings. They therefore concluded to call it Hōden (Hō-ō-den, three syllables).

The general form is that of a temple. From this it has got abroad and been repeated in the daily papers that the building is to be a reproduction of one of the ancient temples of Japan. On the contrary, as has been said before, it is a palace but has the general form of a temple. Each of the separate buildings and all of the details are copied from palatial buildings. The temple at Hei-to-in at Wugi has two wings connected with the main building by corridors or peristyles, and there is a small extension in the rear of the main building. It is called Hō-ō. Hei-to-in is an enclosure or park devoted to the worship of Buddha. It is near Saikyo, the ancient capital of Japan, where the Shoguns formerly resided. Hō-ō-den means a palace whose ground plan bears a general conformity to the outlines of a flying bird. Hō-ō is a mythical bird somewhat resembling, and possibly the same as, what is known to us as the phoenix. It is supposed by the Japanese romancers to have a star on the head indicating the astronomical period of its appearance, and to have visited Egypt every five hundred years, and Arabia, China, and Japan periodically. Chinese literature reveals the tradition that this fabulous bird was only seen when the people had a great and good emperor. Among the Japanese the Hō-ō is supposed to be a sacred bird who is always associated with the glories of the great emperors of Japan in the olden time before the Daimios made practically prisoners of the legitimate dynasty, and put the Shoguns on the throne.

The plan selected for the building is well adapted to the site. The principal front is to the east, facing the rising sun, while the other sides differ from it very slightly. There is great simplicity in the arrangement, but the effect depends upon the exquisite delicacy of the details of carving and colouring, of which the working drawings give no adequate suggestion.

TESSERÆ.

Greek Temples.

TEMPLES appear to have existed in Greece from the earliest times. They were separated from the profane land around them, because every one was allowed to walk in the latter. This separation was in early times indicated by very simple means, such as a string or a rope. Subsequently, however, they were surrounded by more efficient fences, or even by a wall, *erkos*, *peribolos*. The whole space enclosed in such a *peribolos* was called *temenos*, or sometimes *ieron*, and contained, besides the temple itself, other sacred buildings, and sacred ground planted with groves, &c. Within the precincts of the sacred enclosure no dead were generally allowed to be buried, though there were some exceptions to this rule, and we have instances of persons being buried in or at least near certain temples. The religious laws of the island of Delos did not allow any corpses to be buried within the whole extent of the island, and when this law had been violated, a part of the island was first purified by Pisistratus, and subsequently the

whole island by the Athenian people. The temple itself was called *naos*, and at its entrance fonts were generally placed, that those who entered the sanctuary to pray or to offer sacrifices might first purify themselves. In the earliest times the Greek temples were either partly or wholly made of wood, and the simplest of all appear to have been the *sekoï*, which were probably nothing but hollow trees in which the image of a god or a hero was placed as in a niche, for a temple was originally not intended as a receptacle for worshippers, but simply as an habitation for the deity. The act of consecration by which a temple was dedicated to a god was called *idrusis*. The character of the early Greek temples was dark and mysterious, for they had no windows, and they received light only through the door, which was very large, or from lamps burning in them. Vitruvius states that the entrance of Greek temples was always towards the west, but most of the temples still extant in Attica, Ionia and Sicily have their entrance toward the east. Architecture in the construction of magnificent temples, however, made great progress, even at an earlier time than either painting or statuary, and long before the Persian wars we hear of temples of extraordinary grandeur and beauty. All temples were built either in an oblong or round form, and were mostly adorned with columns. Those of an oblong form had columns either in the front alone (prostylos), in the fore and back fronts (amphiprostylos), or on all the four sides (peripteros). The friezes and metopes were adorned with various sculptures, and no expense was spared in embellishing the abodes of the gods. The light which was formerly let in at the door was now frequently let in from above through an opening in the middle, which was called *upaithron*. Many of the great temples consisted of three parts:—(1) The *pronaos*, or *prodomos* (the vestibule); (2) the *cella* (*naos*, *sekos*), and (3) the *opisthodomos*. The *cella* was the most important part, as it was, properly speaking, the temple or the habitation of the deity whose statue it contained. In one and the same *cella* there were sometimes the statues of two or more divinities, as in the Erechtheum at Athens the statues of Poseidon, Hephaestus and Butas. The statues always faced the entrance, which was in the centre of the *prostylos*. The place where the statue stood was called *edos*, and was surrounded by a balustrade or railings. Some temples, also, had more than one *cella*, in which case the one was generally behind the other, as in the temple of Athena Polias at Athens. In temples where oracles were given, or where the worship was connected with mysteries, the *cella* was called *aduton*, *megaron* or *anaktoron*, and to it only the priests and the initiated had access. In some cases the *cella* was not accessible to any human being, and various stories were related of the calamities that had befallen persons who had ventured to cross the threshold. The *opisthodomos* was a building which was sometimes attached to the back front of a temple, and served as a place in which the treasures of the temple were kept, and thus supplied the place of *thesauroi*, which were attached to some temples.

Granites.

There are not more difficult materials to work with than granites; indeed, for centuries the architect rather shunned the strong material. Science, however, has come to the rescue, and by mechanical help great results are now obtained from the most refractory rock. While labour (that of slaves) cost nothing, granite, in early history, was selected for the images of gods, the tombs of kings, for their statues and temples, and for monuments of great events. Indeed, it was always employed in the erection of monuments that were intended to last for ages. In their choice of granite for these purposes the Egyptians were not mistaken. To this day the monuments of Egypt, nay, the hieroglyphs on their bases, are almost as fresh as if just from the sculptor's chisel. The cost of working, however, is still great, but as this cost decreases, as in time it must, we shall see more of it used in architectural work; not in the servile manner in which it is now the fashion to employ the red granite of the north, but in numberless instances where the wind and rain beat, and where it is so admirably adapted to withstand these influences. In this way it might prove a permanent and enduring assistance to buildings composed in other parts of more perishable materials. Granite can now be obtained of so many different shades of colour that any building stone can be found to harmonise with it easily. The sculptor has tried to employ granite in his art, but its mottled appearance and often faulty composition are sadly against it for his purpose. It is needless to quote churches and buildings in this country in which granite has been employed in past ages. Nearly all of them show no symptoms of decay, but in some instances disintegration or decomposition has taken place, and this from the selection of unworthy examples of stone, for it appears that there are some granites no more proof against the weather than the poorest limestones. Hard and compact as granite appears, it is, nevertheless, sufficiently open and porous to admit a considerable amount of moisture. By absorption it will take up nearly $1\frac{1}{2}$ per cent. of water, and where disintegration takes place it is owing mainly to this circumstance. In all stones that admit water and all do frost

employs its terrific force and separates particle after particle till the surface is destroyed. Water conveys the chemicals which exist in the air to the interior, and by its solvent power, due in a great measure to the carbonic acid it contains, decomposes all stones. To judge of the great power exercised by carbonic acid as a solvent, it may be mentioned that all the silica that exists in the vegetable world (and no plant can grow without it) is derived from the stones and flints of the earth, and absorbed by the microscopic capillary cells in the roots, but the solid silica could not pass through these cells and water, we know, will not dissolve flint. How then is it to be accomplished? The rain that falls collects the carbonic acid of the air, and acquires the same from the soil through which it passes, and in combination therewith it dissolves the flinty rock and stone, and thus conveys the necessary support to the roots of all vegetation. In the selection of granite for enduring purposes those in which the constituent minerals are most evenly proportioned are the best. Like small paving-stones each particle seems to help the other, and the smaller the grain the more completely is this the case. Large crystals of feldspar are always objectionable on account of their readiness to decompose. For ornamental purposes almost any granites are available, many affording very rich combinations of colour, and if the surface be polished the weather has less hold upon it and it lasts longer. If granite be totally submerged in water and never exposed it will last unimpaired for ever, thus showing that water alone, without the agency of the air and decrease of temperature to the freezing-point, will not materially affect it. The feldspar of granite is the most likely to decay.

Early Water-Colour Painting.

It has been frequently asserted that the English have no native taste for art, and judging from the early history of art in this country there would seem some ground for the assertion. In the beginning of the last century painting was in the hands of foreigners, who came to reap the harvest it afforded, our own people gathering but gleanings left upon the field; and although there were works by native painters of merit, these were rather pupils and followers of the greater Italians and Flemings that, from the time of our last Henry downwards, were the painters of our kings and princes, and the skilled decorators of their palaces, than holding any decided rank of their own. But from the earliest time there was one branch of art in which English artists had a reputation even on the Continent, and in which they certainly excelled the artists of other nations, namely, miniature painting in water-colours; and any one who is acquainted with the beautiful works of that kind by Hillyard, the two Olivers, Hoskins, and Cooper, will be aware that this statement is strictly true. Their art had its origin no doubt in missal painting, in which the colours were either opaque in themselves, or mixed with white in order to render them so; and the miniature painters continued a modified use of the materials and methods of the missal painters, tending, however, to a use of more transparent pigments. Yet even miniature painting had declined from its palmy excellence in the days of Queen Elizabeth and the Charleses, and fallen, like other art, into mere copying from the works of more gifted painters. The use of opaque pigments, tempered or mixed with water and some glutinous substance, hence called *tempera paintings*, extended to other branches of art besides portraiture, but it was of that solid and opaque kind which is still practised by the scene painter, white being mixed with all his pigments. Some of the artists who wrought in this manner were men of repute. Walpole, the chronicler of our native art, speaks in high terms of praise of George Lambert, the scene painter, and of Taverner, who was rather an amateur than an artist, some of whose works, according to Walpole, might be mistaken for Gaspar Poussin's. But, besides this method of painting, there was still another kind, called stained drawing. The whole drawing was carefully wrought up in Indian ink, and when thus completed a few tints representing local colour were thinly added over the various parts. This branch of the art, as followed at the end of the last century, was topographic rather than artistic. Sometimes the practice was a little varied as far as the first process was concerned, the whole work being carefully drawn in with the pen before the last colour tinting was added; and this use of the pen, frequent in the works of Hearne and Rooker, is to be noted, since it was developed into a means of great expression and beauty in after-times in the hands of Prout and Nash, who made it valuable in the delineation of buildings and architecture.

Correction of Optical Illusions.

The same niceties that form one of the charms of Greek sculpture are equally observable in the *chefs-d'œuvre* of Greek architecture that have survived for our study and instruction. Perhaps it would be difficult to cite a more remarkable instance than the entasis of the shaft of a Greek column. It was found that, owing to some optical illusion, the shaft of a pillar of which the sides are parallel appears to be larger at top than at bottom, and such appears to be the case in the remarkable Egyptian example at Beni Hassan, which has often been

referred to as the prototype of the Doric order. To remedy this defect, the Doric architects diminished their shafts upwards of about one-fifth of their bottom diameter. But then, owing to some other optical illusion, it was found that where the sides of the arch were diminished in straight lines from the bottom to the top, those sides appeared to be slightly concave; this gave rise to the adoption of what is called by Vitruvius the entasis, by which expedient this disagreeable *deceptio visus* was at once obviated. This has always been known, but it has been found that even this expedient was not sufficient fully to satisfy the excessive refinement of the Greek eye, and that the boundary line of the Doric shaft, in the best examples, was made not merely a convex line, but a part of a true hyperbolic curve, a hyperbola, no doubt, of an extremely small axis minor, but, nevertheless, a hyperbola drawn with exact mathematical accuracy. Here is an instance of the extreme delicacy and fastidiousness of Greek taste, and an evidence of the value attached by the Greeks to what probably appears to most of us to be a very trifling matter. The later imitators of the Classic style saw this entasis, but, being utterly unable to feel as the Greeks felt, they presumed that all they had to do was to swell the shaft, and so they swelled it, but to such a preposterous extent that, as Evelyn quaintly observes, their columns appear to be sick of a tympany. A similar evidence of nicety of taste is presented to us in the mathematical precision with which the Greek echinus is curved. The artists of that period were not content with an ordinary and simple curve, which might have satisfied a less sensitive taste, commencing the contour with a straight line and gradually giving the upper part of it a curvilinear form resembling that of the natural echinus. There is another instance of the really wonderful delicacy of the Greek eye. Most students who have looked over the pages of the earliest expounder of the laws of architecture—Vitruvius—used to be sadly perplexed by the instructions given touching the *Scamilli impares* in a Greek order. Mr. Penrose has shown that the course of masonry forming the base line on which the columns of a Doric portico were placed was studiously laid with its upper surface very slightly but appreciably convex; and though Vitruvius, on laying down this rule, does not give us the reason for it, yet there can be no doubt whatever that, like the other minute observances of the Greek masons, the *Scamilli impares*, which were the result of this very peculiar mode of construction, were intended to correct an optical illusion similar to that which the entasis of the column shaft was intended to correct, thus furnishing another illustration of the extreme fastidiousness of these accomplished art-workmen. It is in like manner shown by the measurements of Mr. Penrose that the soffit of the entablature is executed with a very faint concavity. We can well understand the motive for this. Every one will have observed that, through some visual deception, any large surface of flat ceiling appears depressed towards the centre; such an effect on the eye was sure not to have escaped the observation of Greek builders, who adopted this natural mode of correction. One other illustration of their fastidiousness is seen in the faint concavity which was wont to be given sometimes to the facettes of a Doric triglyph. The motive for this concavity may be readily surmised to be a wish to render the drawing of those triglyphs distinctly perceptible, without resorting to too deep or sharp indentations, which might by their shadows have interfered with the effect of sculptured metopes, and detracted in some degree from their breadth and effect, that quality which is one of the distinctive charms of all Greek art.

Glass among the Anglo-Saxons.

We learn from Bede that the art of making glass was unknown in England, even in sheets for church windows, till about A.D. 680, when St. Benedict, Abbot of Wearmouth and Jarrow, "misit legatorios Galliam, qui vitri factores, artifices videlicet Britannis eatenus incognitos, ad cancellandas Ecclesias, porticumque et cenaculorum ejus fenestras, adducerent. Factumque est, et venerunt. Nec solum postulatam opus compleverunt, sed et Anglorum ex eo gentem hujusmodi artificium nosse ac discere fecerunt." We may hence safely infer that whatever knowledge of the art the Saxons may have once possessed was extinct before Bede's time, though it was still existing for the manufacture of sheet glass in France, and perhaps also in Italy. The art of glass-making is enumerated among other secrets of the eighth century in a very curious and ancient Lucchese MS., referred to by Muratori. Certainly one would suppose this art far more likely to have survived in Italy, the seat of the arts, than in any Ultramontane region; and yet the circumstance of the famous green glass dish of St. Peter's, passing in the belief of the faithful for an emerald patina, a holy relic of the Last Supper, would seem to attest the excessive rarity of glass—at least, in the form of vessels. It had long been manufactured for church windows; yet glass vessels were still sufficiently rare and valuable for a German emperor to select from his treasures as a present to a French saint. What, then, are we to think when we meet with vessels of elegant form, delicate material

and difficult construction interred, hundreds of years previously, in Saxon and Frankish graves? Nothing can warrant a suspicion that such vessels are of direct Roman manufacture; but this expiring Roman art may have lingered awhile as a mystery in some early Teutonic hands: "excedens terris vestigia fecit." That the Anglo-Saxons must have had a tolerable acquaintance with the art of glass-making has already been seen. We may further observe they were able to apply it to the glazing or vitreous coating of objects, as appears from specimens of the beads. How, with the instruments we may suppose them to have possessed, they succeeded in cutting deep beds in the larger glass beads as ornamented matrices to receive the coloured composition, or how they so accurately squared the many planes of the crystal amulets, yet remains to be explained. It is also clear they knew enough of chemistry to enable them to impart various colours to their glass, and compound and colour the pastes and enamels employed in the inlaying process, which are so durable as sometimes to have survived when the object they served to ornament has become decomposed.

Coloured Materials.

Whatever colours may be used, they should not be so used as to detract from the harmony and unity of the general effect. For this reason violent contrasts are seldom attended with good results; when such strongly-marked contrasts are not offensive it is when they are uniformly spread over a whole composition. Thus, when in a red brick building stone dressings are used throughout for the quoins, window jambs, cornices, strings, &c., or when on an exterior of red bricks there are reticulations of black bricks over all the plain surfaces, these strong contrasts of colour do not offend the eye, because of the intimate and general intermixture of them; the only effect is that in the one case the light stone dressings lighten the effect of the building, and in the other case the dark reticulations being disseminated over the whole lower the tone without disturbing the unity of the building. But scatter those white stones or black bricks here and there sparsely and at intervals over the front, and the general effect will assuredly become spotty and disorderly. In the distribution of coloured materials regard should be had to the retiring and advancing qualities of colour. Thus white and bright yellows and bright reds appear to stand forward, whilst black, blue and greys retire. Care should be taken not to outrage these prejudices of the eye; for example, when dark and retiring colours prevail at the lower parts of an architectural composition, and the upper parts are of bright-coloured materials, the latter will inevitably appear to advance and overhang the former, producing a false effect that cannot be agreeable. So when buttresses are built of a darker stone than the intervening wall they seem to sink into instead of advance from the face of the wall, and the eye gets puzzled and offended, for an effect is produced at variance with what we know to be the fact. For the same reason a bad effect is produced by a black marble frieze introduced in an order built in other respects of light-coloured materials. When viewed at some distance, or with half-closed eyes, the cornice seemed suspended in the air, or at all events the means of its support were not obvious, and generally we may regard it as a rule in matters of this nature that constructive doubt and uncertainty produce an unpleasant impression, like that produced by the concealment of the feet of figures in a picture. So also dark marble columns in front of a light wall, unless brought out by polish or by a considerable depth of shadow behind them, lose that prominence and æsthetic value which should belong to them. Reverse the arrangement and all ambiguity vanishes; each part then takes its right place in the composition, and the eye consequently rests satisfied. It ought not to be necessary to dwell on a principle that appears so obvious, but it is too certain that the principle, obvious as it may be, is often lost sight of. Special care is needed in the introduction of dark bands and other features of like nature that they do not interfere with the architectural shadows of the composition. Nothing perhaps in architectural design is more important than to preserve its outlines and masses distinct and unambiguous, and as those outlines and masses are best brought out and rendered intelligible by shadow, whatever interferes with the due force of those shadows must detract from the effectiveness of the work. There is great danger in using dark streaks and chequered courses, lest the shadows of the building in which they occur should lose their value. For when not seen so near as to allow of a clear perception of details, these bands are hardly distinguishable from shadows. However easy it may be to cite old examples as a justification, reason ought ever to prevail over precedent. These zebra stripes occur in many parts of the peninsula of Italy and in Spain, as well as elsewhere in Europe and in the East. They may have originated in some constructive requirement, no doubt adding to the strength of the wall. We have no such valid reason to urge in favour of our dark streaks; at all events they constitute one of those eccentricities of the past which scarcely deserve to be disinterred.

HALTON, HERTS—WINTER GARDEN.

ST. PETER, BURNHAM, BUCKS.

THE tower of this interesting church was, until lately, covered with plaster, upon the removal of which several Norman windows were found, which have now been opened out. The buttresses and upper portion date from the fourteenth century, the shingle spire being entirely new. The west and several of the aisle windows, which are good specimens of Decorated work, have, with the tower, been carefully restored by Mr. W. F. UNSWORTH, F.R.I.B.A., the contractors being Messrs. NORRIS & SONS, of Sunningdale, Ascot.

ST. MARY, HORSELL, SURREY.

THIS church has been lately restored, and a new chancel built from designs by Mr. W. F. UNSWORTH, F.R.I.B.A. The contractors were Messrs. GODDARD & SON, of Farnham. The carving to misericordes and elbows of stalls and to screens, &c., is by Mr. J. HITCH, of London. The sketch from which illustration is taken shows chancel screen and stalls.

THE ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Association was held on Friday evening, Mr. H. O. Cresswell, president, in the chair. Mr. A. H. Colquhoun was elected a member. A vote of thanks was passed to Mr. John Belcher in connection with the visit to the new Institute of the Chartered Accountants.

Mr. G. H. FELLOWES PRYNNE read the following paper:—

Screens: their Treatment and Symbolism.

Fascinating as is the study of isolated details of our art, it is not without distinct dangers. The chance of living near, or otherwise being brought in contact with, some one beautiful feature or detail, naturally and healthfully inspires an interest which leads to careful study of the subject, which may in turn lead to the most helpful enthusiasm, but which becomes a danger and a pitfall to the grander conceptions of architectural design as a whole, if it is allowed to end in a hobby. Therefore, in choosing a detail I do so not because it is simply a hobby, but because it is a subject that I hope may not be so often ignored as it has been, but that screens may be treated as one of the great means by which our temples may again become more and more beautiful.

In the short time I have before me I must confine myself to church screen work solely and chancel screen work in particular. In doing so I must say at once that the subject is so large a one and comprises such a vast amount of detail that it will be impossible for me to go minutely into the matter or to give more than a general outline of historical facts, and humbly to offer such suggestions in treatment as may perhaps be found useful to the younger members of the profession at least, when they are called upon to use their abilities in the highest and noblest objects of design, the beautifying of God's house and the furniture thereof.

It may be inquired why it is I have in heading my paper connected the treatment with the symbolism of screens. It is simply because I consider them inseparable. Most undoubtedly screens were originally called into existence for useful as well as symbolical reasons. Their natural usefulness is at once apparent for enclosing spaces, either with the object of preventing unnecessary intrusion or for sake of actual protection. Their symbolical use is not less apparent; that is in marking off and shielding a portion or portions of a building which are held to be places of special honour or specially the spots where the most sacred mysteries of the Christian religion are offered, and in the case of chancel screens they symbolise the division between the life here and the life hereafter, or the separation between the higher and lower estate. And again, when passing under the Holy Rood it is intended to remind one that we cannot attain the highest blessings of Heaven without first passing under the shadow and sorrows of the Cross, or the passing from the Church Militant through the suffering of Calvary to the Church Triumphant.

From the earliest times and in all kinds and stages of religious worship have screens of one kind or another been used to mark off especially honoured spots. In the Jewish Church I need hardly point out that the holy of holies was the place where the priest was alone allowed to enter, and the worshippers had to be content in knowing that the high priest was pleading the great typical sacrifice on their behalf.

Although under the new dispensation all were allowed to be admitted to be partakers of the fruits of the Atonement, and to join with the priest in divine worship, yet is it to be thought for one moment that when the great fulfilment of the antetype had

been consummated on Calvary, that the early followers of Christ should view with less honour the places where the great Christian memorial sacrifice was to be offered to the end of time?

Certain it is, however, that it was this reverence that led the early Christians to adopt the screen. The presbyterium or choir and sanctuaries were separated from the rest of the building either by marble, stone, metal or wood screens or balustrading, not necessarily as high as those of later date, but seldom less than 4 feet or 5 feet from the nave floor level. In the decrees of the Second Council at Tours, in 557, it is ordered that "lay persons are not to enter the chancel, which is divided off by screens, except to partake of the sacrament of the altar."

Old decrees and early writers still speak of this portion of the church as the holy of holies. The altar was even veiled in some cases, and in the Eastern Church veiling is still the custom. In fact, history, ancient writings and architecture itself all go to prove that it is simply a plain matter of fact that in the earliest and purest ages of the Church, chancel or altar screens were considered to be a very essential part of the furniture of a church. It is left for the highly enlightened and intellectual brains of these latter centuries to find or imagine something wrongful and superstitious in this useful and beautifully symbolical feature.

Yes, in these enlightened days, if a faculty is wanted, one often has either to omit the screen altogether or carefully to omit showing the gates, and, if shown, one has to plead they are for safety. If you have not already learnt from sad experience, you would hardly credit how small and vexatious are the quibbles raised by the present day chancellors; they seem to put on their Popish spectacles and see Popery in every detail.

In the ancient planning of chancels, stone pulpits or ambones, similar to those shown on some of the sketches and photographs on the walls, were placed on either side of the lower end of choir. The walls of these ambones often formed a kind of screen in themselves, and in some cases they were designed as part of the screen, as in the churches of the Frari, Venice, SS. Nervi Achille, Rome, and St. Miniato, Florence. The epistle was read from the southern and the gospel from the northern ambones. These pulpits were also used for chanting the lessons and other portions of the divine office.

The date of the introduction of rood lofts is not known exactly, but they are of considerable antiquity. It is more than probable that the first suggestion of the rood beam seen in many churches arose from two circumstances—first, the general use of tie beams, and second, the common and early custom of suspending a large cross in a prominent and central position. The combination of the two is, I think, the most natural suggestion to the mind.

Be that as it may, rood screens and lofts of large dimensions were used at an early date, as that of St. Sophia, at Constantinople, was large enough for the crowning of emperors to take place in it, and in Rheims Cathedral the French kings were crowned in the rood loft. Altars were sometimes erected in lofts at the foot of the rood.

The larger rood lofts are generally ascended by two staircases, carried up either in circular turrets on either side, or in the thickness of the walls.

These staircases often became quite a feature, as in the examples of Exeter and other cathedrals. In foreign examples staircases often go up in the thickness of the screen, as at Metz and Toul, and the church at Oberwessel (illustrated by one of Mr. Millard's sketches).

The earliest screens, however, were undoubtedly of less massive and pretentious character than the rood lofts to which I have just referred.

It was with the gradual growth of community life in the Church that the necessity for more distinctive and solid screens began to be felt.

In cathedrals, abbeys, collegiate and conventual churches, which were originally used by large numbers of ecclesiastics, something more than a low wall or an open grille became absolutely essential for the repose and comfort of those who were compelled by the nature of their long devotional offices to remain so many hours in the church. Churches in those days were not heated by hot-water, steam, and hot-air. Kneeling was not interfered with by small or large-bore pipes running under one's seat. The passages were not then adorned with cast-iron gratings, and one might leave or enter the church without the creaking and rattling grating proclaiming the fact to the whole church that you were on the move. Still, without these innovations, the fact remains the churches were not so comfortable, and to make devotional offices possible some protection from the cold draughts became positively necessary. Even at best, screen or no screen, on cold days it must have been many degrees removed from what we in this nineteenth century consider comfortable. It makes one feel that there is a truer ring about the devotion of these early Christian worshippers. It was, indeed, the case in those days that the words of the Psalmist were fulfilled, "From the rising up of the sun to the going down thereof."

Again, we must remember that the nave, transepts and

aisles were continuously thrown open to the lay worshippers who came in and out at all times of the day, and whose continuous moving about would have been most distracting to those saying their offices in the church.

The general form of the great rood screens was in three, five, or seven bays, and in England the divisions are sometimes more numerous, as at Lincoln, York, Ripon, and other cathedrals. Parochial altars were generally placed on the nave side of the screen. On festivals and occasions of high services the epistle and gospel were read with great solemnity from the rood loft, and so that all on both sides of the screen should be able to join the service; choirs were sometimes also placed in this position.

The dignity of reading the gospel in this way at the foot of the great cross or crucifix appealed to the devout imagination of the worshippers of those days, and as a consequence we see, in the fourteenth, fifteenth, sixteenth, and even seventeenth centuries, rood screens erected in hundreds of parochial churches.

The one central idea was, of course, the elevation of the cross. That the first thing seen on entering the church should be the great and glorious symbol of the Christian faith (a symbol that, shame to say, we have often to hunt for, and in some cases to hunt for in vain in our churches); that those looking on the cross might, in the words of Wordsworth, say:—

Mindful of Him Who in Orient born
There lived, and on the Cross His life resigned;
And Who, from out the regions of the morn,
Issuing in pomp, shall come to judge mankind.

It may be safely asserted that in almost every church up to the end of the sixteenth century there was a screen of some kind or another, and that nearly all had the holy rood set up either on the screen or some equally conspicuous place. The word rood, perhaps I need hardly point out, is taken from the Saxon word "rude" or rood, meaning cross. The rood, as such, used with a screen was seldom considered complete without attendant figures of the B.V.M. and St. John.

The custom of reading the gospel from the rood loft has generally fallen into disuse, and it is now perhaps questionable whether it is desirable in these days to design such massive and heavy screens as were called for in the fourteenth and following three centuries. Don't mistake me for a moment. I am the strongest possible advocate for the retention or restoration of the rood screen in some form or another in every church in the land; but as long as the screen is crowned with its proper symbol—as long as the symbolism of the screen is acknowledged—and as long as the precincts of the sanctuary are properly protected from irreverent intrusion, I should be satisfied. But in designing a screen I should never for a moment aim at shutting out from view the altar and its surroundings; and while I have not much sympathy with the all-seeing mania, I should ever aim at not allowing the screen to usurp an undue prominence by obscuring the far more important feature—the altar. A dreary sight indeed it is to go into some of our dear old churches and be called upon to admire a roodless, but otherwise beautiful, screen as an ancient feature, a thing of antiquarian interest; aye, a thing of beauty of design and workmanship, each very well in their way; but when, on turning to the holy table, one sees a table that you would be ashamed to use in your own dining-room, one feels sadly at the admiration bestowed on this detail. The screen expresses the mere admiration of an art curiosity, and not the reverent admiration and pleasure that one should feel that its main object is the beautifying of God's house.

In no country in the world are there more churches with rood screens, or remains of same, than in England, and for beauty of detail and workmanship they are hardly surpassed.

Having now spoken of the general historical and partially symbolic side of my question, I must, for the sake of convenience, divide the practical side into three sections:—1st. Stone Screens. 2nd. Wood Screens. 3rd. Metal Screens.

First, as regards the treatment of stone screens. The principal stone screens remaining in England are of the cathedral type, such as those at Canterbury, York, Westminster, Lincoln, Gloucester, Exeter, Ripon, Norwich, Wells, St. Albans and others. The general features of these are too well known to render it necessary that I should dwell further upon them in detail. I will, therefore, only pick out one or two leading points in treatment and designs.

The general appearance of these screens at present is of course very different from it when they were first erected. In the first place the rood or crucifix with attendant figures have been removed in every case. In the majority of cases the sculptured figures that formerly occupied the many canopied niches have been destroyed or disfigured, and the niches now appear to be unmeaning architectural features. When on a visit to Winchester Cathedral, I was informed by the verger that one of the Deans had allowed the empty niches in the altar screen to be filled with stone urns (an illustration of the screen with these ornaments is given in Mr. Kitchen's most interesting book on the screen). I remarked that I supposed it was

symbolical of a dead religion. The goodly verger turned on his heel and remarked, with evident indignation "I don't know, sir; I don't know."

In many cases the rood has been replaced by a great organ with cases of fine design, but, in my humble opinion, they are and appear entirely out of place.

Of these latter, York Minster stands pre-eminent, and Exeter, Norwich and Manchester are good examples. Of course, organ-builders and even musicians will insist that this is the best place for the organ. Do not be misled; from an ecclesiastical, devotional, and I think artistic point of view, the position is an utterly wrong one.

Choose the west end, transept, or sides, if you like, but do not spoil the general vista of your churches by blocking them up in the centre with an organ. Do not let the organ be the first object to attract attention on entering the church, and usurp a false position of importance. In short, do not convert your churches into sacred music-halls.

I am anxious not to be mistaken. I desire as much as any man that the organ should have the power of speaking to the soul through the beautiful language that only an organ can speak. I desire to see beautifully-designed organ cases, and I cannot too strongly condemn the far too prevalent custom of shutting away an organ in a mere box of a building, and thus destroying the effect of its soul-stirring notes.

No; a right place and space for all things is the motto. Depend upon it, however, more of our churches suffer from being over than under organed.

I feel in sympathy with a wish expressed by Charles I. on entering York Minster, that the organ might be removed so that the east window could be better seen.

Regarding these massive screens, I must confess that when in the nave I have a feeling of being shut out; especially has this struck me at Canterbury, where I think the nave, as at present, seems cold and undevotional in effect.

The beautiful fifteenth-century screen in the transept of the Martyrdom is well worthy of notice. Of the various screens of the kind named, Exeter seems the most satisfactory. Details I will point out presently by the aid of the lantern slide.

There are not a large number of stone screens left in our parochial churches, but of the few I am able to exhibit the photographs this evening I must mention the exceedingly rich example of a fifteenth open stone screen at Totnes, Devon, one of the finest of the kind in England; it is entirely and richly coloured, and the lower panels show the remains of various painted saints. For many years it was spoken of as an oak screen, the deception arising from the fact that a part of the cornice is evidently oak. There are many points in the treatment that are very uncommon, if not unique. The small canopy work is especially worthy of notice.

An interesting example of tomb screen work exists at Paignton, Devon, and other stone screens at Culmstock and Colyton.

A simply thirteenth-century screen in Berkshire, of which I exhibit a drawing, was carefully restored by Mr. Withers some years ago from a small remaining fragment.

An extremely interesting and uncommon example of what I must call, for want of a better term, "constructional screen work" exists at Westwell, in Kent; the treatment is very suggestive. It is in the form of three trefoil headed arches, supported on two slender columns. The church was restored by Mr. Ewan Christian some years ago.

Another noteworthy example is at Stebbing, in Essex, shown on one of the drawings. The flying tracery in centre opening originally carried the ancient rood, but, needless to say, this has been ruthlessly hacked away.

The screen to the lady chapel in Gloucester Cathedral is a fine Perpendicular example of constructional screen work.

In the treatment of these examples we have the germs of splendid opportunities of this kind of screen design. Constructional screens thus designed have the advantage of being permanent, effective and open, whilst still retaining all the symbolism of the screen.

I have attempted this kind of treatment in a somewhat varied form. First, at All Saints, West Dulwich, which is illustrated on the walls with all detail. I have carried my chancel arch to nearly the whole height of the building, i.e. over 60 feet; have filled the upper portion with tracery, supported on two moulded shafts; I tie the whole together with a wrought-iron tie screen, with sliding slots to allow for expansion and contraction, elevating my large cross in the centre compartment. Whether this effect is satisfactory I must leave those to judge who best know the church. I can only say that I shall never regret having tried the experiment, for the first time I believe, on so large a scale.

Should the members of the Association like to visit the church during one of their Saturday outings, I shall be very pleased to show them over, and my friend the vicar, who is present this evening, would, I am sure, be equally pleased to see them.

I have again tried this effect in my design for a church at

Staines for Sir Edward Clarke, which is just going to be carried out. In this the rood is constructed as an actual part of the building.

In the designing of stone screens generally, my advice is don't make them too heavy and massive, don't make them the means of shutting out a good view of the sanctuary. Be careful to have your detail refined without being weak, remembering that the screen is always under close observation. A beautiful lightness and richness can often be imparted by cutting your panel tracery in complete, or nearly complete, relief, and even in very shallow positions, apparent depth can be increased by undercutting at the back of your cusping. As regards colouring, I will speak of that later on under decoration generally.

Wood screen work is, again, a large enough subject to be treated entirely by itself. There are so many exquisite examples throughout the country that it is a difficult matter to select the best.

I have chosen subjects for illustrations from various counties, but I must say principally from my native county Devon.

The screens of Devon and Somerset stand, I think, unsurpassed as regards beauty in the wood-carvers' art, as the Norfolk and Suffolk screens stand unequalled in the richness of their coloured decorations.

From the selection before you I would ask you to particularly notice the following. Harberton, first, for its pure and fine detail; second, the extremely happy way in which the traceried ornament is carried round the columns, giving continuous unity of effect. The screen is brilliant with golden colour, and saints still adorn the lower panels.

Staverton, with its magnificently carved rood loft.

Kenn, with its restored rood crucifix and attendant figures.

Littleham, for the richness of its lower panels.

Plympton St. Maurice, restored by the late Mr. J. D. Sedding.

And last, but not least, the elaborate rood and parclose screens at Dartmouth.

I have to thank Mr. Hems, of Exeter, who has had a great deal to do with the restoration of many screens in Devon and elsewhere, for kindly sending me some samples of old screen carving and photographs of work done, which are here exhibited.

Staverton is amongst the screens which Mr. Hems has lately restored, and I must say that it is simply a beautiful example of modern carved work. Dunster, Somerset, restored by the late Mr. Street (notice especially the treatment of the rood screen). Newark, the loft at Sleaford in Lincolnshire.

Again, the exquisitely-decorated screen at Ranworth, Cawston, and several other screens in Norfolk, are remarkable for the richness of their colouring, as is also the beautiful Suffolk examples of Southwold. Lancaster parish church has some very fine screen and canopy work.

Much beautiful screen work as there is remaining in our parish churches, still vast indeed must have been the destruction of stone, wood, and even metal screens. Who, with any love for our Church or art, has not lamented to see the sad results of work wrought by sacrilegious hands at the time of the Reformation?

That violent commotion which o'erthrew,
In town and city and sequestered glen,
Altar and cross, and church of solemn roof,
And old religious house—pile after pile.

In designing wood screen work be especially careful not to vulgarise or get coarse detail, and never forget material with which you are designing is wood and not stone. The detail of the one will look weak and feeble if applied to stone, and *vice versa*. Stone detail applied to wood generally looks both coarse and vulgar.

Don't think I am simply asserting a truism; it is really a fault that is fallen into far too often, and I have seen several examples where oak pulpits have been actually copied in stone with simply disastrous effect.

I think it questionable whether it is wise to keep on designing screens with heavy rood lofts for our churches. The lofts cannot in most places be used, and to me it seems somewhat purposeless to copy a Mediæval idea simply because it is Mediæval; by all means have rich canopy work and other elaborate treatment which may suggest itself, but I feel that the heavy rood loft with its galleried front, deep-carved cornice and groining under, seems to unnecessarily block up the church. A clergyman once remarked to me that when he entered a church of this kind the heavy rood loft seemed to strike him like a bar. I can quite understand the feeling.

There have been a large number of very beautifully-designed screens in modern times. I illustrate one or two examples, one of a charmingly simple treatment by Messrs. Bodley & Garner, at the Eton Mission Church, Hackney Wick, and another at St. Paul's Church, Morton, Gainsborough, by Messrs. Micklethwaite & Somers Clarke.

The spirit, however, in which the old screens were designed

should enter into our modern work. It is summed up in inscription seen on so many screens.

Let fall down thy *ne* and lift up thy *hart*,
Behold thy Maker on yond cross all to torn;
Remember His woundes that for thee did smart,
Gothyn without syn and of a virgin borne.

The rood-beam treatment does not seem to have been so common in England as elsewhere. There is a beautiful example of loft thrown across from wall to wall, without screen under, at Avesbury, Wiltshire.

Some of the modern rood beams have been well treated, and I think in the design for the new church at Miles Platting, Manchester, by Mr. Leonard Stokes, is very finely treated; as is also that in the new Roman Catholic Church of the Holy Rood, Watford, by Mr. Bentley, whose work is so truly devotional.

There are two sketches of suggestive treatment—first, of St. Stephen's Chapel, Westminster, and the high altar screen at Westminster, by Mr. W. H. Brewer, which are well worthy of careful notice.

Before leaving the subject of wood screens, I must refer to the beautiful example of seventeenth-century screen at St. John the Divine, Leeds—a screen erected about 1642. The whole of this church is full of beautiful woodwork of that period.

East Church, Kent, is a fine example of one of the thirty rood screens of that county.

The church of St. Mary, Woodleigh, Devon, where I found the remains of the old rood in the soffit of the chancel arch, is an interesting example.

Now as regards metal screen work, a subject again teeming with interest and worthy of the closest study, of which here I can only touch the fringe.

Two best Gothic examples are perhaps, first, the screens on the tomb rail at St. George's, Windsor; second, the ironwork of Queen Eleanor's tomb at Westminster; and other numerous examples of grille work. France has many beautiful examples, of which Amiens is an excellent specimen. The grilles at St. Martin's, Brunswick, and Jesuits' Church, Cologne, are but small examples of the quantity of beautiful work to be found in Germany. The finest collection of ironwork for exhibition is, perhaps, that brought together at South Kensington Museum, where one can study the beautiful examples for many hours.

With regard to design I would say, don't try to produce difficult mouldings in metal work. Imitation of wood and stone treatment in metal, as in some iron screens of this century, is utterly wrong. For the ready production and strength good horizontal lines in the upper part lessen the difficulty in making a screen. The insertion of panels in considerable number, which can be perforated or worked to almost any design, gives great firmness to the work, and they are easily fitted.

Nor in any large work is it desirable generally to use more than one metal. Of course, in small work, which can be got at easily, this remark does not apply. Should variety of effect be required, this may best be obtained by gilding, that is, in the case of ironwork.

But brass and ironwork mixed, if not carefully treated often seems to have a patchy effect. Brass when allowed to oxidise for a long time becomes rotten from the zinc used in its manufacture. Brass of the sixteenth and seventeenth centuries stands better than the modern metal, because it was made in a better manner, that is, without so much zinc in it—in fact it was more like bronze. Therefore, if thought advisable to use more than one metal I should advise bronze or copper. Bronze figures can be fairly cheaply introduced with very beautiful effect, and I cannot help thinking that there is a great future for bronze work of this kind, as it is more lasting and often more effective.

There is as good a work in these days turned out from the anvil as in past times. Messrs. Singer, of Frome, are well to the front in this matter, and have turned out some beautiful work, specimens of which I show upon the walls. Among other modern work I must especially name the beautiful screen from Mr. Pearson's design at St. John's, Red Lion Square; St. Michael's, Leeds; grilles at Truro and elsewhere; also the screen at St. Swithin's, Bournemouth, designed by Mr. Norman Shaw.

One of the great faults found in the designing of ironwork seems to be from the general want of knowledge of proportion and sizes of the iron used, and the consequence is that great heaviness and clumsiness is often the result. A good plan is to have a good number of pieces of iron, both square and circular, in your office for reference.

Treat your work simply, without over-ornamentation; always use collars instead of screws, and don't file up your work on completion.

A paper on the treatment of screen work would not be complete without some reference to colour decoration.

1st. As regards stone work, some consider it a sin to use colour for decorated stone work. I am by no means ready to join in this condemnation. Stone screen work can be decorated with equal value as any other material if it is only treated

properly; but it must be treated boldly and without fear. Totnes, as I have before said, is a beautiful example of this kind of work.

The examples that we have of coloured wood work are so numerous that it is unnecessary to dwell upon this subject beyond saying that one should not be afraid of using strong colours, and not falling into the error of depending upon dull æsthetic colours so much in vogue at present. In the dull light of our churches bright colours well harmonised are best.

The decoration of iron work is a somewhat difficult matter; but gilding is, I think, the best treatment. In St. Peter's, Plymouth, I have attained a good effect by first painting the screen in deep dull red, and gilding on the face only, except in the case of the collars or bands, where the gilding was carried round.

Mr. Millard proposed a vote of thanks to Mr. Fellowes Prynne for his paper. This was seconded by Mr. Leonard Stokes, supported by Mr. Warren, Mr. Sidney Vacher, Rev. J. Beeby, the vicar of All Saints, Dulwich, and carried by acclamation.

THE ARCHITECTURE OF BATH.

IN a lecture forming part of a course on "Architecture as the Language of the English People," delivered at Bath by Mr. C. R. Ashbee, he said that the architectural story of England from the close of the Puritan movement into modern commercialism was a step still further down in the ladder of decadence, until they came to what might be called the revival in the middle of the nineteenth century. In this last rung of the ladder they had at the end of the last century a little outburst, a little sort of exotic growth of very beautiful work in the midst of the decay, which was called the Greek Revival, and it was in connection with this transitory and rather hectic phase of English art and architecture that they connected the city of Bath. The close of the eighteenth century left art at its best with the work of Gibbs, the Brothers Adam, Chippendale, Flaxman, Josiah Wedgwood and the English school of painting. All had left their mark in one way or another, and all were more or less inspired by one motive. The principal influence at the close of the century was direct from Greece and marked by the introduction of pure Greek forms. This was best seen in the work of Flaxman, and they saw his influence in a building like the Guildhall, for instance, in the illustrations of Homer. And whenever they saw those delicate forms, such as in the cornice around that room, in that they had the sort of thing that Flaxman delighted in. The architecture of this time, and the architectural planning of a city in the quiet and majestic manner of the Greek Revival, was best illustrated by the city of Bath. He knew no city in England which was so complete in its anyone style of architecture—which was so completely worked out, as it were, in one motive—as the city of Bath. Bath expressed the whole of the eighteenth century, but more especially the latter half. In Bath in the work of Wood and in the planning of the streets, crescents and circuses, the Adam's period was well expressed. There was a largeness and dignity of planning and an extreme refinement of detail. These were the two peculiar characteristics of the architecture of Bath. There were whole streets laid out at a time and planned as one whole—a thing hardly ever done at the present day owing to the impossibility of building through the condition of the land system and system of land tenure at the present day. This made an architectural scheme almost impossible. The peculiar beauty of Bath was the unity of design in it, and it would be the greatest possible misfortune to pull down one of the houses in Pulteney Street, for instance, and rebuild it with red brick. The architectural planning of Bath as a whole, the planning of a street as a whole, and after that the planning of a certain number of buildings in a street as a whole, was a peculiarity of Greek architecture. With it they saw an extreme refinement in detail. He showed them how the room in the Guildhall where the meeting was held was planned on those lines, observing, however, that he was sorry it had been so badly painted. The whole proportions of the room were spoilt by the colour. If that room were treated in one tender colour as a whole they would see at the same moment the large planning of the room and the extreme refinement of detail. Therefore they would see the characteristics which prompted the architects of that time in their work. The tradition of the eighteenth-century art was, however, broken off by the great war, and the industrial and political revolutions in modern England began politically with Waterloo (1815), but artistically they might date it from the beginning of the nineteenth century. The great commercial England was destined to sweep away the last vestige of English architecture, and utterly degrade it altogether. Puritanism had done its worst, but commercialism added another superlative. They might connect with modern England the names of Sir John Soane and the Prince Regent George IV., calling it, so far as the two were concerned, the nadir of English architecture. It was in George's days they

had the last vestige of Protestant architecture at its worst. Between 1800 and 1830 was the worst period in English architecture. A variety of new influences then entered: first, the oriental; second, the romantic; third, revolution ideas; fourth, the religious movement; fifth, the painters. The net result of these five influences was to produce an hitherto ill-digested eclecticism. They would remember that Pulteney Street was not eclectic, and the result was they saw at the present day a great variety of work.

THE PRINCIPLES AND PRACTICE OF VOLUNTARY ARBITRATION.*

IN introducing the subject of voluntary arbitration to the notice of the Society of Architects the author has been prompted to do so through the recent joint action of the Corporation of the City of London and the London Chamber of Commerce in bringing the subject so prominently before the public. A close acquaintance with the leading principles relating to arbitrations is desirable for all business men, and essentially so to an architect, engineer, or surveyor, on account of the many debatable questions which constantly arise in connection with building and other such contracts, and of their peculiar nature.

Disputes arising out of contracts entered into in connection with the construction of buildings necessitate for their proper settlement lengthy inquiries; the taking of complicated accounts, the measurement of works executed and omitted, and the viewing of premises, things which cannot conveniently be done by a judge or jury; and such disputes must of necessity be referred to some person who is able to properly inquire into the matter and ascertain the rights of the respective parties thereto.

Arbitrations are of two kinds—compulsory and by consent; and it is with the latter it is proposed to deal.

To understand the subject it should at the outset be borne in mind that any agreement to settle a prospective dispute without recourse to legal procedure is a contract impeding the administration of the law, and as such repugnant to the common law of the land. Such an agreement was at one time inoperative, as being against public policy, and opposed to a fundamental law of the Constitution that every man shall have the unfettered right to appeal to the properly constituted judges of the country. The Courts have always jealously guarded this right, and it was not until comparatively modern times that laws have been made with a view to assist in the final adjustment of disputes without recourse to litigation.

Since the principle of voluntary arbitration has been legally recognised, the system has grown into one of enormous proportion, culminating in the establishment in the City of London of an elaborate organisation for finally settling disputes of all kinds which arise among business men, without the assistance of a Court of Law.

The idea of voluntarily settling differences without recourse to litigation is not by any means a modern conception. We learn from the researches made into the City records, that as long ago as the fifteenth century aldermen sat as arbitrators to settle disputes to which the Hanseatic merchants who resided in the City were parties. Again, from remote Saxon times existed the Pie-poudre Court, which was held in connection with the Bartholomew fair and other markets, which so-called Court consisted of a tribunal presided over by laymen, who settled disputes which arose between buyers and sellers at the market, in order that they might be finally adjusted on the spot.

The first attempt made by our legislators to place arbitrations upon a satisfactory basis was in the reign of William III. (9 Will. III. c. 15), when an Act was passed for determining differences by arbitration, and was intended to place agreements to submit to arbitration where no action was pending on the same footing as if a cause was pending, and enacted that merchants and others desiring to end any controversy for which there was no remedy but by personal action at law, or suit in equity, might by arbitration agree that their submission of their suit to the award or umpirage of any person or persons should be made a rule of court, and insert such their agreement in their submission. It was also enacted that upon a rule having been made the parties should submit to, and the suit be finally concluded by the award of the arbitrator.

In consequence of the wording of this statute an arbitration held thereunder could until quite recently have been rendered nugatory, even though the submission had actually been made a rule of court if there happened to be no agreement in the submission that it should be made a rule of court (*re Rouse* 6 C.P.D. 612), unless, according to a recent case, a clause that the provisions of the Common Law Procedure Act, 1854, should apply was inserted (*Mitchell v. Governor of Ceylon*, 7 L.N. 265).

* A paper read by Mr. Edgar Farman, solicitor (honorary secretary), at a meeting of the Society of Architects, on February 28, 1893.

Following on in order of date we find the Statutes 3 and 4 Will. IV. c. 37, the Common Law Procedure Act, 1854, and the Judicature Acts, all of which contain provisions applying to the settlement of disputes by arbitration, both compulsory and voluntary.

So far as they apply to arbitrations, all these statutes have now become of historical interest only, as the provisions contained therein affecting the subject have been repealed by the passing of the Arbitration Act, 1889 (52 and 53 Vic. c. 49). This statute not only makes fresh provisions of a most useful and important kind, but also consolidates the law upon the subject. This of itself is a great boon to all concerned in references, and a precedent which might usefully be oftener followed, for the system of producing year after year amending statutes, which partially, but not wholly, repeal former ones, has become little short of a public scandal, making it in many cases almost impossible to ascertain what the law really is. Happily this remark cannot be applied to the subject under our purview to-night, the present law of which we will now consider. In the first place the law, as stated in this paper, applies to England and Wales only, and came into force on January 1, 1890.

The preliminary agreement between the parties to a reference to arbitration is technically known as a submission; and a submission is defined as a written agreement to submit present or future differences to arbitration, whether an arbitrator is named therein or not. The agreement must be in writing, and signed by the parties or their agents and stamped. Whether an agent has power to bind his principal by agreeing to refer a dispute to arbitration depends upon the extent of his authority. An architect would not have such power under an ordinary retainer.

A submission is now irrevocable, except by leave of the Court or a judge, unless a contrary intention is expressed therein. Until the passing of the recent Act a submission has always been liable to be revoked under certain circumstances, and this is one of the mischiefs which the Act is intended to remedy.

It does not appear to be now necessary for a submission to be made a rule of court, as the bare agreement to submit a dispute to arbitration has the same effect in all respects as if it had been made an order of the court.

It is often the practice to insert in submissions the manner in which the arbitration shall be carried out, and the name of the arbitrators selected, and there is still nothing to prevent special arrangements being adopted; but with a view to prevent questions arising from incomplete or badly drawn submissions, and also to bring about uniformity of practice, a very useful schedule has been annexed to the Act which contains a set of rules for the conduct of references, and which by force of the statute apply to all submissions unless a contrary intention is expressed therein. This is an exceedingly useful provision, seeing that the regulations set out will inseparably apply to all submissions unless expressly excluded, either partially or wholly. This was one of the happiest ideas of those responsible for the passing of the measure, and it will certainly be the means of preventing many of the technical objections which it has hitherto been possible for an obstructing party to take.

Let us for a moment consider the present effect of the Act upon a bare submission to arbitrate, or one which does not contain complete provisions as to the conduct of the reference. If no other mode of reference is provided, the reference must be to a single arbitrator. This will, no doubt, meet with the views of many who hold the same opinion as a well-known author upon this subject, who states that nothing in his opinion has tended more to bring discredit upon the resort to arbitration than the practice of having two arbitrators. If a provision has been inserted in the submission that there are to be two arbitrators, in such case the two arbitrators appointed will have the right, at any time before the time within the period during which they have power to make their award, to appoint an umpire. The appointment should be in writing, and signed by both arbitrators, but it does not require a stamp. The time within which the arbitrators must make their award, which must be in writing and stamped, denoting that the *ad valorem* duty has been paid thereon, is within three months after entering on the reference, or after having been called on to act by notice in writing by any party to the submission, or on or before any later day to which the arbitrators by any writing signed by them may from time to time enlarge the time for making the award. Upon this the question may well be asked when does an arbitrator enter upon a reference? In the case of *Baker v. Stevens* (L.R. 22, B. 523), it was held that he only does so when he enters into the matter in dispute with both parties before him, unless he is proceeding *ex parte*, which he can do under certain circumstances. If the arbitrators have allowed the time or extended time to expire without making an award, or have delivered to any party to the submission, or to the umpire, a notice in writing stating that they cannot agree, the umpire may forthwith enter on the reference in lieu of the arbitrators, and in such case the umpire must make his award

within one month after the original or extended time appointed for making the award of the arbitrators has expired, or on or before any later day to which the umpire by any writing signed by him may from time to time enlarge the time for making his award.

Subject to proper legal objections, the parties to a reference must submit to be examined by the arbitrators or umpire, on oath or affirmation, in relation to the matters in dispute, and must produce all documents within their possession or power respectively which may be required or called for, and do all other things which during the proceedings on the reference the arbitrators or umpire may require. Witnesses can be compelled to attend, and must, if the arbitrators or umpire think fit, be examined on oath or affirmation, and the award made by the arbitrators or umpire will be binding on the parties, and on all persons claiming under them, respectively. The award must be properly drawn and be reasonable. An award directing any party to do an impossible act would be bad. Under the provisions of the Stamp Act, an award is liable to *ad valorem* duty. The fact that such a document is not stamped does not render it bad. On the other hand, however, it cannot be acted upon. The arbitrators or umpire have power to direct by whom, and to whom, and in what manner the costs of the reference and award shall be paid, and may tax or settle the amount or any part thereof, and may award costs to be paid as between solicitor and client.

The law which will apply to references in the absence of any express stipulations to the contrary has now been dealt with. The regulations contained in the schedule before referred to are clear, and fall in with what may fairly be assumed is the intention of parties to a submission in the large majority of cases.

To proceed with the subject generally, any person of sound mind and understanding may act as an arbitrator, whether of age or not. There is, therefore, nothing to prevent an infant acting, if the parties desire it. Further than this, it does not appear essential that the selection must be confined to the male sex. There should now be no difficulty in selecting a suitable person as arbitrator in any dispute since the establishment of the London Chamber of Arbitration, which has caused to be compiled and published an approved list of selected gentlemen connected with all the great industries and professions in this country, ready to act when called upon. Has the fact that women are able to act as arbitrators escaped the notice of the City Fathers? There is not a single lady in the list, although disputes are quite conceivable upon which they can form a better judgment than men. It is an amusing spectacle which one sometimes beholds, of a county court judge entering into the mysteries of the fit of a bodice, or other feminine apparel. We nearly had lady county councillors; why not lady arbitrators?

Another source from which capable persons can be drawn is the High Court of Justice, as since the Judicature Act, 1884, the official referees attached thereto have been allowed to act in private references.

There are, of course, many gentlemen outside the Chamber's list, eminent and expensive, and there is nothing to prevent the council of a society such as the Society of Architects acting collectively as arbitrators in a dispute.

Notwithstanding the fact that an agreement has been made to refer a dispute, it often happens that one of the parties repents his act, and upon a dispute arising immediately commences a legal action—which he is clearly entitled to do. This may appear a startling statement after the previous remarks, but it is a fact nevertheless, which forcibly reminds one that, notwithstanding recent legislation, it is still considered undesirable to allow such agreements to oust the Court's jurisdiction. The proper course to be taken in such a case is to enter an appearance to the writ, and before delivering any pleadings to apply to the Court to stay the action, which will be done upon proper evidence being adduced and the Court being satisfied that there is no sufficient reason why the matter in dispute should not be referred. As an instance of a case in which the Court would not restrain legal proceedings, reference may be made to the action of *Wallis v. Hirsch*, where gross fraud was alleged by the plaintiff, and the Court under the circumstances refused to allow the question to be settled by two brokers.

Even if no legal action be taken there are still many ways in which an obstructing party may endeavour to delay the reference and bring it to a deadlock. Let us consider how they may be frustrated. A submission may provide that the reference shall be to a single arbitrator, and all the parties cannot agree who shall act as such; or an appointed arbitrator may refuse to or cannot act under a submission, and it does not appear from its terms that the vacancy shall not be filled up, and the parties fail to agree as to supplying the vacancy; or, again, where the parties or two arbitrators are at liberty to appoint an umpire or third arbitrator and fail to do so; or, lastly, where an appointed umpire or third arbitrator refuses to or cannot act, and the submission does not provide that the

vacancy shall not be filled up, and the parties or arbitrators do not supply the vacancy. In all these cases the proper course to be taken is for any party to serve the other parties, or the arbitrators, as the case may be, with a written notice to appoint an arbitrator, umpire, or third arbitrator. The notice should be clear, and if after service default is made by the parties served in complying therewith within seven clear days after service, application can be made to the Court to appoint a proper person, which under such circumstances will be done.

It often happens that when a submission provides for the appointment of two arbitrators, one to be appointed by each party, one of the arbitrators is unable or refuses to act. In such case the party appointing him may appoint a new arbitrator in his stead, provided there is no provision to the contrary in the submission, and, subject to this, in the event of the party entitled to appoint, purposely or otherwise, failing to do so, either originally or by way of substitution, the other party to the submission may serve a notice upon him to do so, and if he fails for seven clear days to appoint an arbitrator pursuant to the notice, the party serving the notice, and who has appointed his arbitrator, may appoint that arbitrator to act as sole arbitrator, and in such case the sole arbitrator's award will be binding. It may be mentioned that in this case the Court has power to set aside any appointment made in this manner.

In every case, unless the submission provides to the contrary, an arbitrator has now power to administer oaths in a reference. An arbitrator can, if he desires the opinion of the Court, state his award as a whole in the form of a special case, and he can also do so in part upon any question of law.

If an arbitrator has made any clerical mistake, arising from accidental slip or omission, he may now correct it.

Another very useful provision of the new Act is that providing for the compulsory attendance of witnesses. Hitherto it has been necessary to obtain an order of the Court to compel a witness to attend. Now, however, the solicitor for a party requiring the attendance of a witness can obtain a writ of subpoena by the same means as in an action. Witnesses must now attend as long as required; formerly they could not be compelled to attend for more than two consecutive days. If a witness is within the United Kingdom, but outside England or Wales, an application to the Court for an order for his compulsory attendance is still necessary, and if he be in prison a writ of *habeas corpus* must be applied for. A witness can be compelled to produce documents, but need not make any statement in evidence, or produce any papers which would render him liable to criminal prosecution.

If an arbitrator has allowed the time for making his award to expire without doing so, the Court has power to extend it.

Great care should be bestowed upon the wording of the award, and care should be taken not to give an opportunity to a party to get it upset by the High Court. The tossing up of a coin by two arbitrators to settle their differences, or the acceptance of a present, would both be good grounds for setting an award aside.

The Court will not in every case set aside an award, and it has power to remit it back to the arbitrators for rectification or review. If an award is remitted back, the arbitrator must make his fresh award within three calendar months after the order is made, unless otherwise directed in the order. In one case it was decided that the mere fact that an arbitrator has made a mistake in point of law is no ground for setting aside an award, and in another it was decided that an award will not be remitted back upon the ground that the arbitrator has made a mistake in law upon which his award is based unless he admits it. In such a case an arbitrator should at once admit his mistake if he has made one.

The Court has power to remove an arbitrator, before award, for misconduct.

After a reference has been successfully carried out, and everybody is satisfied except the unfortunate party against whom the award goes, the situation may arise of having to enforce it. Before the recent Act, if the submission had been made a rule of court the award could have been enforced by attachment, if not, then the successful party had to bring an action upon the award. At the present time the matter can be carried out more easily and effectively by simply applying to the Court for an order that the award be enforced by the same means as if it were a judgment or order of the Court itself.

Arbitrations should be conducted as far as possible in the same manner as a trial. Too much attention cannot be bestowed upon selecting a suitable place wherein to hold the inquiry—suitable for hearing the parties, their solicitors and witnesses. The author speaks feelingly from personal experience. An arbitrator in his discretion has the power to order all or any witnesses out of the room, but it is not desirable to act thus with the principals to the dispute.

The arbitrator should take notes, and only admit in evidence what would be admitted in a court of law. Time will not permit discussion upon the law of evidence to-night, although it is of the utmost importance to arbitrators. It is quite open

to an arbitrator to postpone or adjourn a reference for any purpose, such as to take a view. Upon the question of inspecting the subject matter in dispute, it may be said that in the case of *Munday v. Black* (9 W.R. 274), being a dispute over work done to a house, it was held that an arbitrator is not bound to take a view.

Such is an outline of the law relating to arbitration, which has been enacted to facilitate the holding of extra judicial inquiries. The proverbial "law's delays" has, it is said, driven a large amount of genuine commercial business away from the Courts of Law, and in view of this allegation special interest attaches to the recent foundation of the London Chamber of Arbitration, and time alone will show whether the Chamber supplies a real or merely a mythical want.

The London Chamber of Arbitration was not founded in a day. In fact, it has taken between ten and eleven years to produce it in its present organised form; and it is the outcome of a motion made by Mr. Henry Clarke, L.C.C., in the Court of Common Council on April 5, 1882. Those responsible for the institution of the Chamber firmly believe in its superiority over legal tribunals, and say that it will save time, money and temper. Whether it will do so is a question of fact to be proved by experience. At present it can only be said that everything has been done calculated to bring about such a much-to-be-desired result. One thing is quite certain, that but for the passing of the recent Act the institution of the Chamber would have been an impossibility. Most men will agree in the assertion that recourse to arbitration will sometimes save time, and those who know anything of the learned registrar of the London Chamber of Arbitration will agree that those who desire rapidity of action will have their wishes fully gratified in that institution. There is no delay allowed in the Chamber. It is often asserted that arbitrations are less expensive than actions at law, and in some instances this may be true, but it may be safely asserted that in many instances it is not. Theoretically, arbitration is a means of settling disputes without the aid of the law or the lawyers, but practically it is not. The cost of carrying out a reference is in all details as great as in an action at law. Solicitors are engaged, witnesses must be paid, and the cost of procedure is just as expensive as if an action were pending instead of a voluntary reference; and, to cap this, a judge has to be provided. In a legal action one can obtain the services of the highest judges in the land for nothing, and if this is not enough, the outlay of twelve shillings will secure the compulsory attendance of twelve good men and true to assist in determining the question in dispute. In an arbitration the serious cost of the arbitrator must be considered, and the high fees paid in many instances are out of all proportion to the work involved, and in many cases increases the cost to a far larger sum than would have been incurred in an action. A correspondent of the *Liverpool Mercury*, where the establishment of a Chamber of Arbitration in Liverpool has been discussed, says that there the past experience of arbitrations has not been altogether favourable, and that certain companies in that city could tell astonishing tales as to the cost of some of their arbitration cases. No charge of exorbitant fees can be brought against the London Chamber of Arbitration. On the contrary they have rather erred in the other direction. The rules of the Chamber are admirably framed, and calculated to insure a speedy settlement of a dispute submitted to its jurisdiction. These rules partially adopt the implied rules which obtain under the Arbitration Act, and in other respects contain special provisions.

In order to insure the success of the Chamber, its rules should be such as will meet the requirements of the commercial community, and thereby create a favourable impression. That the City Corporation and the London Chamber of Commerce are alive to the importance of this fact is evident from the manner in which the rules are framed. There are, however, one or two points to which attention should be drawn, and which deserve consideration.

The three great inducements held out in a publication which may be described as a Corporation blue book, issued in favour of the Chamber, are, that "it will save time, it will save money, and it will save temper;" and as to the last of these qualities no remark is necessary, unless it means that the soothing tone of the amateur judge is more likely to pacify an irate party than that of the real article. If this is the meaning of this part of the text, it is difficult to agree with it. Experience tells the opposite tale, as the beaten party generally bitterly laments in strong language the fact that he did not go to law and obtain what he believes to be his legal rights. The inducement held out, that the adoption of the Chamber will save time, is unquestionably correct, and this fact is eminently calculated to bring grist to the Corporation mill; but in obtaining these much-to-be-desired qualities care must be taken not to run foul of human nature, and wreck the ship at the outset.

Rule 35 of the Chamber provides that the costs of an arbitration shall be in the discretion of the arbitrator, but when one is brought face to face with another rule that only the cost of

attendance at the hearing and witnesses will be allowed, it is at once apparent that each party has practically to bear his own expenses. It has been already stated, and may now be repeated, that theoretically arbitrations are supposed to be carried out without recourse to law and lawyers, but that practically they are not, at least as far as the lawyers are concerned, and this being so it may be unhesitatingly said that the rule in question will be the means of keeping away nearly the whole of the business for which the Chamber is instituted. "Every-man-his-own-lawyer has a fool for his client" is a well-known saying and a true one, and business men know it, and invariably in all disputes consult their solicitor, and further, even if they do venture into the portals of the London Chamber of Arbitration alone, they will speedily retreat with the lengthy and legal looking documents placed before them to sign, to consult their solicitor upon their legal effect. The result of the consultation with a solicitor will at once open a client's eyes to the fact that he will have to pay practically all his own costs, notwithstanding the fact that he may win the case. Now, a client always thinks he has a good case, and burns to make his opponent pay for all the expense and trouble he has been put to, and very naturally does not see the force of having to pay a lot of expenses forced upon him through an opponent disputing his rights. A case in point occurred in the author's own practice only a few weeks ago, when the client ridiculed the suggestion that he should adopt the Chamber for settling his matter, which was a building dispute, when it was pointed out to him that he would have to pay out of his own pocket practically the whole of his own costs.

There is no reason why the recognised rule, which obtains in our Courts and in ordinary arbitrations, that the loser must pay the successful party's costs, should not be adopted in the London Chamber; and, besides, there is another strong reason why it should—the knowledge that reverse in litigation will inevitably involve the unsuccessful party in having to pay the costs incurred, acts as a great check to frivolous and vexatious disputes.

As the rules of the Chamber now stand, it will be quite open for an unscrupulous party to a submission contained in a building or other similar contract, under which many questions can be easily raised, to dispute all along the line with practically pecuniary impunity.

Attention should also be drawn to the fees allowed by the Chamber to arbitrators, which are only payable for the hearing, and amount to two guineas the first hour, and one guinea per hour afterwards. Speaking from an arbitrator's point of view, it appears that these fees are too low.

In very small and simple cases the scale of fees may work as at present, but they certainly are not sufficient in ordinary and larger matters. If the scale allowed were extended to every hour actually expended by the arbitrator upon the reference and the preparation of the award, then the fees would be much nearer the mark. There are many arbitrations the actual hearing of which take only an hour or two, but which necessitate a subsequent lengthy personal investigation apart from the actual hearing, and for which, under the rules, the arbitrator will not be paid at all, neither will he get anything for the preparation of the award, which in many cases is a difficult instrument to draw in legal form, and is prepared by a solicitor. A case can be called to mind of an arbitration over some dilapidations, the hearing of which occupied under two hours, but before the arbitrator could make his award it was necessary for him to inspect and measure up twenty houses, which took him the best part of a week. Under the rules of the Chamber he would apparently get for the work the handsome sum of three guineas.

It is true the arbitrators can make special terms beforehand with the parties, or refuse to act, but from the rules and the way in which the scheme is put forward disputants will no doubt submit to the Chamber, under the impression that the cost of an official arbitrator will be in accordance with the scale of fees prescribed in the schedule, only to find out subsequently that one cannot be provided except at as high a figure as if the Chamber had not been adopted, with the result that the cost of the arbitration will actually be much more expensive to the successful party than if it had taken place in the ordinary manner, because by the rules of the Chamber he will have to bear practically the whole of his own expenses, which he would not have to do in an ordinary arbitration. It would be much better for a fixed reasonable sliding scale to be adopted for the arbitrators' fees, regulated according to the time expended, and an additional fee allowed for the preparation of the award, and no arbitrators nominated except those willing to act under the rules and according to the official scale.

Another matter which may be mentioned is the at present compulsory rule that the parties to a dispute must sign the submission framed by the Chamber. This may work all right where no previous agreement to refer has been entered into, but in the majority of cases submissions are entered into long before any dispute arises, as in a building contract. The Chamber should adopt and publish a short agreement to be

inserted in contracts, and certainly adopt any submission framed with a view to the hearing of the matter by the Chamber, whatever may be its form. The Chamber appears to be of this opinion, as the matter has recently been discussed, and the author has been favoured with an advance copy of an agreement for insertion in contracts, but it is too long; what is wanted is something very short.

ARCHITECTS' FEES.

THE action brought by Mr. Wilson, a Bideford architect, to recover 152*l.* 15*s.* for work done by him for Mr. G. Taylor, has been heard at the Devon Assizes. Counsel for plaintiff said the defendant resided for some time at Westward Ho! at which place he had considerable interest in property, and was at present residing at Abbotsham Court. In October 1891 the defendant communicated with the plaintiff, expressing a wish to see him. They met soon afterwards, and plaintiff accompanied the defendant to Westward Ho! the latter desiring to convert the Ladies' Baths at Westward Ho! into a boarding-house. He requested the plaintiff to proceed with the preparation of the necessary plans and specifications. Plaintiff acted upon these instructions, and prepared rough plans, which defendant approved. Afterwards more elaborate plans were prepared. Mr. Wilson was asked to get on as quickly as possible with the work. The plans were got out and tenders issued for the work, the defendant informing the plaintiff that he had his wishes pretty well expressed on the plans. Some correspondence then occurred, and it terminated in defendant refusing to have the work done. All the work was completed which an architect could carry out beyond the supervision of the actual building. Defendant had offered 35*l.* for the plaintiff's services rendered, but this was refused, Mr. Wilson contending that he was entitled to the amount claimed.

The plaintiff gave evidence corresponding with the statement of counsel. In cross-examination, he said he was occupied on the work for ninety days, but not the whole of that time. His brother also assisted him. He denied going through the form of getting out bills of quantities in order to be able to charge for the work. He did not know that Mr. Hookway was employed by the three persons who tendered to prepare the bills of quantities for them. He knew that Mr. Hookway was employed by Mr. Glover.

Mr. F. W. Wilson, who assisted to prepare the plans and specifications, said he accompanied his brother to Westward Ho! and heard the defendant give his instructions. He also heard Mr. Taylor ask his brother at the office at Bideford to prepare the bill of quantities.

Mr. Jas. Jerman, architect, said he had examined the plans and specifications made by the plaintiff, and he thought his charge was a fair one. He charged according to the local rates, which would have been about 7*l.* less than plaintiff's amount.

Mr. Charles E. Ware, architect, said the plaintiff's charges were fair and reasonable, and were those recognised by the schedule of the Royal Institute of British Architects.

Counsel said he had other well-known architects of the county ready to give evidence as to the correctness of the amount charged, but he would not call them, as they would simply corroborate Mr. Jerman and Mr. Ware.

Counsel for defendant said there were only two questions for the jury to decide. Mr. Taylor would state that he always informed the plaintiff that he was only to prepare plans not to exceed 800*l.* or 900*l.*, and having known the defendant's wishes thoroughly the plans should not have been prepared for a larger amount. The plaintiff, however, on the other hand, said that was never mentioned until after the tenders came in. The second point for them to decide was whether the defendant ever instructed the plaintiff to prepare a bill of quantities. He asked whether it was not dangerous to allow any profession to charge their own commission.

His Lordship: That comes very near home.

Mr. George L. Taylor, the defendant, stated that he told the plaintiff he wanted to spend 800*l.* or 900*l.*, but if plaintiff's estimate exceeded the sum, witness had another scheme to lower the bath and let the sea run in, thus saving the cost of pumping. He also further stated that he had another scheme to spend the money on a villa. When plaintiff brought the plans to Tanton's Hotel, Westward Ho! defendant asked him what the price would be, and he said between 2,000*l.* and 3,000*l.* Witness asked him what he meant, and knocked the plans off the table, saying he told him he would not spend more than a third of the money.

The Judge: What did the plaintiff say?

The Defendant: He didn't say anything.

The Judge: Did he pick up the plans?

The Defendant: Yes; he picked them up and went away.

The Judge: Then he didn't say anything, but picked up the plans?

Defendant further said he gave an instruction for quantities,

to be got out by Mr. Wilson. It was the custom for the builders to get them out themselves. In cross-examination Mr. Taylor admitted that the plans were submitted to him, and that he did nothing to prevent tenders being obtained. He did not think there was any letter in existence in which he mentioned that he did not wish to go beyond 800*l.* or 900*l.* He denied giving any direct order for the quantities.

Mr. Murray, jobmaster, of Westward Ho! said he accompanied the plaintiff and defendant over the baths. He heard the latter tell Mr. Wilson that he required rough plans for the conversion of the baths into a boarding-house, but that he did not want to pay more than 800*l.* or 900*l.*

Counsel for defendant said the case was pre-eminently for the jury to decide as men having knowledge of business matters. It was admitted that if there was an understanding or an agreement, plans should be got out, and they should not exceed in the cost of building and alteration more than 900*l.* The truth was that plaintiff had made an unfortunate mistake in the preparation of his plans.

His Lordship said it seemed to him that a great deal of time and care had been expended upon the preparation of the plans, and plaintiff should be paid for the work undertaken. The whole dispute between the parties was as to the amount of the tender, and the jury were to decide which of the two men they could best rely upon as to what really took place.

The jury, after twenty minutes' deliberation, gave a verdict for the plaintiff for 96*l.* 10*s.*, including the 35*l.* paid into Court.

The Future of Architecture.

SIR,—An eloquent writer in this month's *Nineteenth Century* review has some remarks on the above subject, which you had allowed me to discuss in your issue of February 17, and as he is rather more hopeful of the future than I can persuade myself to be, and as I think he is a little at fault in his history and his logic, I should like to recur briefly to the matter.

He says, "And so history tells us it must be. The dead Gothic will never live again any more than the dead Classic, but from its ruins ought to arise, and will arise, if we work honestly and rationally and not like mere antiquaries and copyists, something new, something that lives, a modern art which will be to us what bygone styles were to those who speak to us through them. Signs are not wanting, especially in England, that this new growth has begun; let it be ours to secure its freedom for development." I for one will pray devoutly that this be true, but a few isolated examples of excellent work are insufficient proof, nor does my own reading of history permit me to lay the flattering unction to my soul. If the improvement is to come within reasonable time, something more powerful and active than development is necessary. What has modern architecture during the last fifty years to show of the power of development?

On the other hand, one of the greatest, noblest and most useful and beautiful of the styles—most useful because fairly in harmony with modern wants—was not the work of development, but largely of adoption or eclecticism in a sudden national crisis. The Romans before the sixth century were, as regards their architecture, pretty much in the same position as we are ourselves at the present day. They had no national style of their own, but busied themselves with copying Etruscan and Greek examples of the art, and under Constantine and Honorius its character had fallen to zero. For its resuscitation some new and all-powerful stimulus was indispensable. It speedily came. A new life and new artistic wants were created by the accidental meeting of Western with Eastern artists. The West had been at war with the East. Justinian and his soldiers had seen the vast arches, lofty domes and rich internal decorations of the Sassanian palace at Ctesiphon. The Emperor had concluded a treaty of peace with Anushirwan of Persia, the king of kings, and in the intercourse which followed many skilful designers came from the East and supplied him with much of that artistic element by means of which he made his buildings monuments of beauty such as have never been surpassed. The great church of Santa Sophia, which he built at Constantinople, differed from all previous structures in its magnificently vaulted areas, decorated with gold ground mosaics, by means of which the Christian Emperor recorded the tenets of his faith. In all subsequent buildings on the soil of Italy this style continued to exercise an important influence almost down to the present day.

Now, though we Englishmen are like the Romans I have been referring to, having no living national style of architecture, nor a wealthy and despotic prince like Justinian, able and willing to engage in grand and noble architectural projects, even if the result should promise to be as striking as that I

have referred to, yet perhaps we may be on the way to it, that is, to putting life into our architecture, for, as I said before, there is none in it at present.

Our era is a very wonderful one, and, happily, the net political result of the last half-century is such as to satisfy the most ardent reformer. On all hands progress is conspicuous, and if the "mother of all the arts" seems to be asleep just now, it is impossible to glance at the present general state of the arts and of industry and not have hope in the future; indeed, for him who can even remember 1851, with its international exhibition and "Chamber of Horrors," a perfectly satisfactory future in every branch of art and science must seem assured.

What, then, is the ground for hope and confidence in the future of our own particular art? For my own part I am inclined to rely upon the democratic spirit of the age, without which the past progress could not have been realised. With Board schools, in which the young are taught how to draw, with schools of art, museums and picture-galleries in almost every parish, and many other popular institutions, an educated democracy must be rising up that will have not only the power, but the will, that the requisite encouragement and expenditure shall be given to the establishment of a national style of architecture, with edifices characterised by excellence of construction and materials, beauty of design and details, and differing from any national building that has been done before in this metropolis, inasmuch as it will be impossible they will fall to pieces in the lifetime of the designer.

Thus, sir, if I am not mistaken, we shall see one of the noblest illustrations of the liberal spirit of the age, enlightened democracy taking the place of crushing despotism in the patronage of the arts, and, with it all, good wages and moderate hours of labour, so that the workman will have time to think not only of his body, but of his mind and his soul.

HERMES.

Coventry Baths.

SIR,—In your issue of 10th inst., two lists of tenders for heating apparatus are given, from which it appears that the Rainbow Engineering Company's tender was accepted in October last, after which other tenders were obtained, and that of the Coventry Gas Fittings Company, Limited, was accepted by the City Council on the recommendation of the Baths Committee (vide *Architect*, March 3, p. 16).

The procedure of the Coventry Council seems, as you call it, unintelligible, and you suggest that an explanation would be of interest.

Although it may not be a full explanation, the strange course taken by the Council is rendered very much more intelligible by a comparison of a list of Coventry Councillors with a list of shareholders in the Coventry Gas Fittings Company, Limited which shows that the interests of the shareholder have been well cared for by the Councillor.

Some further explanation would be very welcome to, yours obediently,

TRUTH.

March 16, 1893.

GENERAL.

The *Meissonier Exhibition* produced on the first day no less than 16,000 francs.

Mr. *Herkomer, R.A.*, has been elected President of the Birmingham Society of Artists, in succession to Mr. Orchardson, R.A.

The *Exhibition* of the Royal Society of British Artists will open on Monday next.

A Paper on "The Manufacture of Non-poisonous White Lead" will be read by Mr. Perry F. Nursey, C.E., at the meeting of the Society of Arts on Wednesday.

The *Committee* elected for the Glasgow Architectural Association are as follows:—Hon. president, Mr. Campbell Douglas; president, Mr. Alexander M'Gibbon; vice-president, Mr. Alex. N. Paterson; hon. secretaries, Mr. John White and Mr. Walter Watson; hon. treasurer, Mr. Hugh Dale; hon. librarian, Mr. W. Tait Connor; general committee, Mr. Robert J. Gildard, Mr. Andrew Robertson, Mr. John Arthur, Mr. Wm. Fraser.

The *Government of Bengal* have sanctioned an estimate of 1,49,884 rs. for the construction of a new building for the local School of Art.

Mr. *Henry Morris*, who served his apprenticeship with Messrs. Ross & Macbeth, architects, has been presented with a purse of sovereigns and a handsomely-fitted travelling-bag on the occasion of his leaving Inverness.

Mr. *T. Mellard Reade* has been appointed architect for the Board school which is to be erected in Kensington Fields, Liverpool.

A Paper, entitled "A few Notes on Hot-water Supply," will be read by Mr. R. J. Angel at the meeting of the Liverpool Architectural Society on Monday next.

The Architect.

THE WEEK.

Two of the foremost of the jurors in the section of painting of the forthcoming Salon have resigned their office. M. BOUGUEREAU says he does not approve of the regulation by which the number of works exhibited is limited to 1,800, and he therefore feels it would not be right to accept functions and assume responsibility for carrying out the proposal. M. BENJAMIN CONSTANT states that he will shortly be on his way to Chicago, and therefore cannot serve as a jurymen. It is not unlikely that some other jurymen will follow their example. Both artists were members of the First Group, with MM. MAIGNAN, CORMON and HENNER.

A PAPER was read by Dr. PHENÉ, architect, on "Golden Apples," at the last meeting of the British Archæological Association. Nearly twenty years ago Dr. PHENÉ visited various localities in which legends of a python were associated with golden apples, to elucidate, if possible, these myths. He succeeded in finding curious varieties of original forms of pomaceous fruits, not indigenous to the localities, but of Oriental origin. These he made known, and as the botanical evidence pointed to Persia and the traditions to India, he determined to prosecute his inquiries in the East. As result he obtained information in which the pear-shaped fruit of Rama was found to be the same in form and indentation with the objects held by the priests of Asshur, and on the apple-like espalier formed trees of Nineveh. He produced examples by photographs of this shaped fruit being offered to the Hindu deities, of their eating it, of its form on the thyrsus, on altars at Pompeii, &c. The tree was also traced, through geological and historical writers, to western Europe and into the districts of the well-known classical myths. These myths, legends and apples in every case led into the orchard and cider districts of Gaul and Britain, and there were found with them in the West the names of places and peoples identical with those named by HERODOTUS and others as the possessors of trees in Thrace and India. A direct line of route bearing the same names in considerable number was shown from India to Britain of several different tribes or peoples, who in almost every case were found to be located side by side with each other and to have the same customs, worship and habits. Many points indicated their association with dolmens, and it was pointed out that the dolmen districts in particular abounded with these traditions, and were almost always in apple and cider localities. Hence it was inferred that these immigrants were the builders of the dolmens and the introducers of the apple and pythonic traditions in Western Europe.

In last November the Works Committee of the London School Board asked for sanction of a further expenditure, not to exceed 3,000*l.*, for the provision of a tower (containing five additional rooms) in connection with the enlargement of the head offices of the Board now in course of erection, this amount being inclusive of the cost of providing a striking clock. The proposal was sent back for further consideration. The Works Committee now say they have since considered this matter more carefully and have obtained further information from Mr. EDIS, the architect for the enlargement, who states that he roughly estimates the additional cost of making the proposed addition to the centre of the building as enlarged (which will contain four additional rooms), together with a clock, at 1,500*l.*, and that the outside limit of the cost would be 2,000*l.* The additional accommodation which would thus be provided could only be obtained, if hired, at a rental of about 90*l.* per annum, and the committee are strongly of opinion that it would be desirable to make this provision while the other contemplated alterations to the offices are being mistaken. As it will be necessary to take immediate action if the proposed alterations are to be carried out they ask that the alterations to the offices of the Board, in accordance with the plans submitted, including the proposed central feature of the tower, be

carried out by Messrs. HIGGS & HILL, the contractors, for the enlargement of the offices, the work to be measured up on completion, and the cost calculated on their contract schedule of prices.

A MEETING of the Birmingham Association was held on Tuesday last, when a report was presented by the Council on the building by-laws of the city and their administration. The secretary was instructed to communicate with the public works committee, with a view to obtaining some modifications therein, and in the methods of administering them, which, it is thought, would lead to much improvement in working. Mr. HERBERT R. LLOYD brought under the notice of the meeting the clause in the conditions of competition issued by the committee of the new Municipal Technical School, referring to the award of premiums, and reserving to the committee the right to employ an architect other than one of the competitors to carry out the works, and the secretary was instructed to communicate with the committee, pointing out that the clause is derogatory to the profession, and likely to prevent some of the invited architects from competing.

It will be an advantage for many architects, builders and contractors to know that DORMAN, LONG & Co., Limited, of Middlesbrough and Westminster, have opened a yard at Nine Elms Lane, Vauxhall, where a large stock of all the girders rolled by the company and several other sections of steel will be kept, to supply orders without delay. Machinery has been also laid down capable of dealing with the manufacture of compound girders, the cutting, fitting and drilling of holes in joists, &c., and by its aid DORMAN, LONG & Co. are prepared to guarantee delivery of orders at a few hours' notice. All their girders are made at their own works from "Siemens-Martin" steel, having a tensile strain of from 28 to 32 tons per square inch, with an elongation of 20 per cent. in 8 inches, and are made to pass the tests specified by the leading engineers and architects. The sections of rolled steel joists kept in stock range from 3 inches by 1½ inches, weighing 4 lbs. per foot, to 18 inches by 7 inches, weighing 75 lbs. per foot. The latter can be obtained up to 45 feet in length, and lengths of 16-inch girders up to 50 feet are kept in stock. Delays in the supply of joists often cause much inconvenience to architects and builders, and they will be able to appreciate the enterprise by which all the sections and lengths that are required in the majority of cases are placed at their disposal in London.

FROM Latin grammars and other school books the notion is derived at an early age that the ancient Romans were a sort of people who, like soldiers in general, treated most things as if they were part of drill, and therefore mechanically. Their roads are supposed to have been as much alike in character as if they had been constructed according to one specification. There is, however, a difference between the Roman roads in England and in Scotland. Some sections of a road near Moffat, in Upper Annandale, have been lately closely examined by Mr. J. T. JOHNSTONE. The road was found to be 21 feet wide, with a whinstone kerb along each side. From foundation to crown it was 23 inches, exclusive of the turf covering it. As a foundation there was a layer of clay, with stones bedded on its surface, 6 inches deep in the centre, and tapering to each side, the stones being undressed and pressed from an inch to an inch and a half into the clay. Then came a layer of stones, 11 inches deep, with vacancies filled up with "till," the stones being on the average the size of a boy's head. On the top was a layer of smaller stones some 4 inches deep, forming the surface of the roadway. A mile further south the depth was about the same, but there were only two layers of stones, with evidently about an inch of peat moss on the bottom. At a spot three miles north the bottom layer was 11 inches deep, the clay and the stones had the appearance of having been mixed together and laid in like concrete, and the stones were small and similar to those first described; while the next and surface layer was 6 inches thick, formed of stones, with the vacancies filled up with "till."

THE SPITZER COLLECTION.

DURING the two months between April 17 and June 17 of the present year, collectors, amateurs and dealers from many parts of the world are likely to visit Paris, attracted by the dispersion of the renowned Spitzer Collection. Some of them will no doubt become purchasers at the auction, but the majority of the visitors may only be desirous to behold the collection, or part of it, *in situ*, adorning the rooms of the house in the Rue de Villejuste, which was planned and erected by SPITZER in order that his treasures might be most advantageously seen. In him the qualities of the dealer and the enthusiastic amateur were combined in the strangest way, and many people who were acquainted with him believe that the collection which is about to be sold was accumulated for his own delight. It was his practice to spend all his available time in the rooms, and who knows how often, like MAZARIN among the pictures he had acquired, SPITZER was troubled with the thought that one day he was destined to part from objects that to him at least were not inanimate?

As one of the keenest dealers of his time, SPITZER must have felt that it would be impossible to convince the world of the existence of any other motive in his breast except buying in the cheapest and selling in the dearest market. But the collection in his house is unlike anything to be found in the largest warehouses of "curios" and "antiques." In the first place, it mainly represents two periods—Gothic and Renaissance. Classic art is only scantily represented, and probably was allowed admission in the house because it was supposed to have a relation to Renaissance work. Byzantine art was also a necessity, for without examples the section devoted to ivories would not be so fully appreciated. But the variety of Renaissance objects is so marked we might suppose that SPITZER contemplated the exemplification of some comprehensive book upon those periods. Let anyone compare the descriptive catalogue and photographs with DE LABORDE'S "Glossaire et Répertoire," or any other standard treatise, and it will be found that the collection goes a long way towards the illustration of the terms. But SPITZER would not be satisfied with securing every object which was described in an archæological dictionary relating to his period. With him it was not enough for an object to be produced in the thirteenth century or the sixteenth century. No doubt he was ready to satisfy his clients, but when catering for himself beauty of form was of more importance than age. Judging from the character of his collection, SPITZER was entitled to be considered as possessing the most refined taste. There is hardly one of the pieces in his house that does not deserve to be taken as an example of artistic power. We may, or may not, approve of the principles that were adopted in their production, but we are forced to acknowledge that we have before us works which will bear comparison with any of the most prized efforts of contemporary artists. On that account GAMBETTA was giving prudent advice when he recommended that the Spitzer Collection should be acquired by the city of Paris, or the French Government, and preserved as it was left by the owner. It is not only valuable for containing many rarities among the three and four thousand choice examples, and for being so strictly preserved from everything that would not gain the admiration of experts. It has, moreover, the unity which is secured when artists observe rational rules of decoration. Your connoisseur might not be satisfied with the collection, because SPITZER was indifferent to the personal associations which are believed to impart interest to the meanest things. If the workmanship of a cup was beautiful he was willing to pay a large price for it, although it might not have belonged to a king's mistress nor was used to poison a rival. He proudly left his purchases to speak for themselves. They might not be successful in appealing to the fribbles who are bringing archæology into contempt, but among the most vigorous class of designers and workmen in Birmingham, Manchester, Sheffield, Glasgow, Belfast, or in one of the American cities (for we need not count France and Germany) they would be eloquent and inspire emulation. If the money that is expended every year in England on useless pictures or books which nobody will be allowed to read (like those lately presented to Manchester) could be

devoted to the purchase of the Spitzer Collection, an act would be accomplished which hereafter must be still more appreciated than in our time. For long years will elapse before there are chances presented for securing such a variety of treasures, and in the next place it is improbable that a man like SPITZER will be found who will set his heart on securing and preserving unbroken a multitude of objects in spite of continual efforts by his millionaire clients. At present there is no sign of preserving the collection. It is not easy to discover a philanthropist who is willing to expend half a million sterling in order to encourage industrial art: more *éclat* is to be gained by donations on behalf of fine art, that is to say, on paintings. The utmost that may be expected is that some of the European Governments will endeavour to fill up gaps in museums out of the hoard. The French Government have already agreed to an expenditure of 20,000*l.* with that intention. The precious series representative of sculpture in boxwood will no doubt be secured for Berlin, and will hardly go unattended by other work. But the greater part of the *chefs d'œuvre* of the Mediæval and Renaissance craftsmen are sure to find their way to the cabinets of the treasure seekers who have so long coveted them; although, with all their gold, they could not tempt SPITZER to disturb the completeness of his collection by sacrificing the smallest of the jewels, ivories, medals or embroideries. SHYLOCK declared he would not part with the turquoise that LEAH gave him, when he was a bachelor, for a wilderness of monkeys, and who can tell how many mysterious associations bound the Wandering Jew of the bric-à-brac world to the beautiful things for which princes became suitors? He could feel the satisfaction of being able to resist all that wealth, diplomacy, enthusiasm and power were able to do in trying to prevail with him, and as he wandered from room to room would enjoy the luxury of security, thankful that his race was no longer compelled to yield to brute force, to cower before rank and to submit to spoliation. HEINE knew Paris as well as SPITZER, and was a better judge of the influence of modern ideas, yet it was surely an apprehension of the probability of a return of the old animosities which made the poet write the warning epigraph to his Hebrew Melodies, in which he counselled his brethren to prefer the safety which comes from obscurity:—

Fliegt dir das Glück vorbei einmal,
So fass' es am Zipfel.
Auch rath' ich dir, baue dein Hüttchen im Thal
Und nicht auf dem Gipfel.

SPITZER did not act on that advice, for he not only set up his house in a prominent quarter of Paris, but he allowed all the world to come and see the treasures he had been garnering during many years and from many lands—treasures which were enough to make a capuchin become covetous.

He was too skilful a trader to forget in his own house the advantages of arrangements for enhancing the appearance of *bibelots*. The tapestry that lines the staircase walls and the sculptured figures that seem to be guides raise the expectation of the visitor. The first room entered is SPITZER'S own, which appears to be a sanctum for some luxurious amateur rather than a place for business. Paris is no longer around. The light enters through stained-glass windows. The eye at once rests on the great chimney-piece, which came from Arnay-le-Duc. Wherever the visitor looks he sees many things to attract his notice; and, as it were, the contents of the remaining rooms are suggested to him by the examples of statuettes, faïence, metal-work, &c. In one place is a famous "dressoir" from Annecy; in another the cabinet of gilt leather which was made for PHILIP III.; old "armoires" from Lyons are contrasted with others of Burgundian types. The panels of the door are filled with Spanish grotesques, and on one is inscribed a sentence that might with advantage be written over the doors of all museums and galleries of art, "*carpere facilius est quam imitari*"—"It is easier to criticise than to imitate."

The adjoining room is lighted from above, and in it French Renaissance is paramount. There are many examples of sculpture, seventy-five pieces by PALISSY, embroideries from Tours, aiguères or water-flasks and drinking-cups from Dinant (then a French town), illuminated manuscripts,

leather-work, coffers, pottery, &c. Of French enamels there are seventy examples, coming from various schools. Then come the ivories, ranging from the severe Byzantine productions to late Renaissance figures, which suggest that some sculptors preferred the material to marble or bronze. Rivaling them in delicacy are the boxwood carvings which were produced in Germany, and were not without influence on the sculpture in stone and bronze.

The collection of Mediæval goldsmiths' work is a testimony to the fascination which the Church exercised over artists. It is no wonder that so many examples, not only in the Spitzer, but in all large collections, are supposed to be the work of monks. Laymen who were subjected to the rigorous laws of trade are considered to have been incapable to spend the time that was necessary in elaborating designs and models and in giving the utmost perfection to all the details of so many remarkable pieces. They are as much opposed to principles of political economy as the interlaced ornament of Celtic manuscripts. There is another difficulty, which also supports the theory of the prevalence of monastic goldsmiths. This is the absence in numerous cases of peculiarities by which the pieces can be identified as produced in particular cities or districts. If such exquisite chalices, ciboriums, reliquaries, shrines, crosses, thuribles, figures, &c., were obtainable in many places, why is it that we have not examples of secular work displaying similar skill?

The Spitzer Collection affords additional evidence of the all-but inexhaustible wealth of Italy in works of art. On one of the reliefs which came from Sassuolo the Duke ALPHONSE D'ESTE had inscribed "Hic nunquam minus solus quam cum solus," "Never am I less solitary than when I am here alone," or, as PROSPERO expressed it, "My library was dukedom large enough." The words reveal to us one of the causes for which art was promoted in Italy. Pictures and sculpture were not employed merely for ostentation, or as means to impress visitors; they afforded so much genuine delight to the owners that they became a necessity. It was the same with the minor arts. If elsewhere in SPITZER'S house we have survivals of a devotion to art, the Italian room, with its sculpture, goldsmiths' work, enamels, glass-paintings, coffers, jewellery, tapestry, furniture, faience, &c., in which not merely form but colour is expressed, seems to recall a time when admiration became idolatry, and a land where "art and miracle drew equal breath." The few examples of Greek and Greco-Roman art which SPITZER introduced are not over-severe, and not without relationship to Italian work.

One important class of Italian art which some critics believe to be the most interesting among all SPITZER'S gatherings will not be sold at the auction which begins next month. We refer to the collection of arms, and in which about six hundred weapons and pieces of armour are to be seen. They show that men in steel were not repulsive, and if the old Italians used ironclad ships they would impart some beauty to them.

Ordinary people must be content without any sample out of SPITZER'S cases. Fortunately they need not be without a record that will afford some compensation. On account of the extraordinary character of the sale—for it will require about forty days to dispose of the three thousand and sixty-nine "lots"—a catalogue of commensurate importance has been issued. It consists of two large volumes of letterpress and a portfolio of seventy folio plates filled with photographic reproductions of the most interesting objects. There are some men who can find attractiveness in any sort of auctioneer's catalogue, but in this case it is no exaggeration to say that for artists, amateurs, students of art, craftsmen and manufacturers the catalogue of the Spitzer sale will become a substitute for a museum of Renaissance and Mediæval art. It is to be obtained from Mr. CHARLES DAVIS, of New Bond Street, the London agent. If it is remembered that the retrospective exhibitions of Paris in 1878 and 1889 owed much of their interest to the contributions from the late M. SPITZER, the value of a record of the collection will be evident. Every school of art in the country should possess a copy of the catalogue, which will be found to be an invaluable supplement to all treatises on the work of the periods to which it relates.

THE RELATION BETWEEN THE ENGINEER AND THE ARCHITECT IN AMERICA.*

IN a proper sense the term "architect" should designate a man of certain attainments, but in deference to a popular prejudice it is applied in the following to an artist who designs and superintends the erection of buildings, although it will be admitted after due consideration that our best architects are quite often as good engineers as they are artists, and that sometimes they are pre-eminently good business men.

The first and most evident of their relations is the jealousy between them which should not exist, considering how intimately the work of the two professions is interwoven. Yet we find, on the one hand, an engineer of considerable experience complaining of the architect's treatment of "the man who does the practical work," while, on the other hand, a great many architects do not employ a man of proper training and experience to do their engineering work, claiming that there is not enough of such work to require it, or else that they find the engineer impracticable or intractable.

There is no doubt that if the engineers were perfect, they could find fault with good grace with the artistic architect for the impracticable way in which he sometimes plays with the interests of his clients, promising drawings and results for dates weeks in advance of what is possible, and the architect could with as much reason criticise the way in which the engineer serenely erects the most hideous structures, simply because he fancies that he can in this way save to the owner a few pounds of metal or a few dollars of cost. These are extreme cases, and they are each day becoming rarer, but they serve to explain why the feeling of jealousy exists, since each feels that the other is guilty of a sin that is unpardonable, while his own is not so very bad, all things considered.

The ideal requirement is that all of the various qualities of good artist, good engineer and good business man should be combined in one man, who would be qualified to give each branch its proper weight in the solution of any problem. In practice this is generally impossible of attainment because of the widely-varying temperament and training needed for the best results, and we must therefore look to a combination of these three elements in at least two individuals, working together in each architectural combination that is to meet the implied obligation assumed by every professional man when he solicits the patronage of his fellows, to render a service at least as good as the average, and, in some particular, better. We should then have the various problems that each commission contains carefully studied by specialists, and the final result would represent that happy mean that is the best for the case.

The writer has had considerable experience in this line, and feels that the cause of much of the friction is due to the lack of proper training of the engineers for this particular work, due largely to the newness of the demand.

Instead of the feeling that once existed that the architect should know at least all that the "Encyclopædia Britannica" contained, people nowadays are differentiating and do not expect so much of practical things from the artist, but in many cases transfer to the business or practical man a part of this requirement of mechanical or engineering knowledge, and welcome the services of the expert whenever they are rightly needed.

The requirements of the "domestic" or architect's engineer are certainly great, since he must have on tap at all times information of the best usual practice in regard to character and resistance of materials, including earths, stones, bricks, clays, woods, metals, cements, plasters, glass, paints, papers, wools and other textile fabrics, and methods of manufacturing and working these materials; heating by hot air, hot water or steam; ventilation, steam cooking, gas and electric power and lighting, steam-power plants, plumbing, water-supply and sewage disposal and the laws relating to contracts. He must also be sufficiently trained in mechanical engineering to be able to appreciate the requirements of almost any manufacture or business, so as to be able to make plans for the case in question at least as good as the average or a little better. His experience in these branches must be such that, while the first studies are being made, he can formulate the requirements in such a way as to determine the approximate limits of the space required for each of the mechanical features, so that space can be allowed for them at the beginning which will be sufficient for his needs when the time comes to take them up, perhaps months after the plans are drawn and the work begun. He must know enough of art to appreciate its limitations, so that his suggestions of what must be done to accomplish economical buildable results may be permissible from the artistic point of view. He must also know that a given lay-out of the framing will be within a small percentage of the most economical that can be made for the given case, so that his assistants can be kept at work on the detailed computations, thus keeping pace with the balance of the work. In the actual execution of work he should be able to do anything that is needed on a building,

* A paper by Mr. George Hill in the *Engineering Magazine*.

although perhaps not in the expeditious way that can be gained only by long practice. Finally, he should know that in each of these varied branches his knowledge must be in a measure superficial, and that there are men in each branch who know more than himself, who should be called to his aid when the interests of his client demand expert advice.

To obtain such knowledge as is here outlined it is necessary that a man be thoroughly trained in some good technical school, preferably mechanical, and that his mathematical training be of the most thorough kind—not that he will ever need anything higher than trigonometry, but that the analytical habit that comes from a thorough mathematical training may be acquired. He should be able to converse readily in both French and German, and should attend a few lectures in architecture, or read a few good architectural works to get an idea of first principles. Finally, he should be a careful reader of the technical journals.

On graduation he should begin the acquisition of experience, going from one job to another, staying in one place only long enough to get the more evident of the fine points involved, and then on to another until he has done work in each branch. He should join the technical societies in the junior grades for the further carrying out of this purpose. During this period he will have rubbed against many men and should have learned to make himself agreeable to all; he will have formed many acquaintances and heard many practical talks. Finally, he should trace for a time in an architect's office, and when he thinks he has become sufficiently posted to be able to write a good specification, evolve one from his inner consciousness and compare it with one written by a competent man, to see how many things he has left out, and how much he still has to learn. Then he should finish off as the assistant of some good domestic engineer for six months or a year. If the material is in him, he will then be able to stand alone in responsible charge of work. He should have learned to control his temper at all times and under all conditions and never to announce a decision until it has been carefully studied, and then not to change it until at least twice as much time has been given to it as was given originally.

It might be well if he could try his hand at architecture in a small way so as to learn practically how great are the annoyances and how many the details that have to be looked after. This would make him appreciate better the trials of the artist.

The architect, on the other hand, requires a thorough training to fit him for the proper discharge of his duties. These are not only the drawing of a pretty picture, but the building of a substantial, handsome, and economical building that will meet all the requirements of its use, and that will be erected at a reasonable cost and in a reasonable time. He must also be sufficiently posted in construction, so that during the period of small things he will be able to do fairly good construction and know when his knowledge is at an end and an expert's knowledge is desirable or necessary. He must not lose sight of the art in his work, as this is of prime importance, and he must therefore spend his time principally in improvement in this line. Habits of exact thought, logical reasoning, and concentrated effort should be acquired, and he should be especially drilled to a realisation of the necessity of regarding all commissions in their true relative importance. This ground has been well covered in a paper by Professor Ware, of Columbia College, which affords an excellent basis on which to start a discussion of what the architect should be taught. So instructed, the architect would be prepared to regard the engineer more as a co-labourer than as a necessary evil, thus making their relations of a pleasanter nature.

Having now determined the knowledge that the architect and the engineer should each have, it remains to so apply it that the result of their joint labours shall be the best possible under any given conditions, for it must be borne in mind that there was never yet a problem in architecture capable of a solution that was, in every particular, the very best possible. There must always be something that could be better were it not for something else that must be considered.

We are accustomed to think that, when the architect is the principal in a building in which the constructive features compose at least 75 per cent. of the work, it is a case of "the tail wagging the dog." But if we should examine the work of some man who so believes, being accompanied by a good critic, we will find in every part of the work evidences of that neglect of proportion that makes all the difference between a good job and a botch. The writer knows of instances where many thousands of dollars were spent after the building of a house, to get it into better proportion.

There is also the other extreme, in which the architect sacrifices everything else for a certain effect that could have been obtained in a different way at a saving of many thousands of dollars to the client. Each of these cases really only illustrates our human weaknesses and shows how necessary it is that there should be two minds of differing characteristics, examining each problem to insure against such blunders. Then we should have each one doing that share of the work that he was best

fitted for, which in practice might reduce itself to this procedure:—

When a client entrusted a commission to an architect, he would first confer with the business man—practical man or engineer or whatever else he may be called—discussing the entire problem. Then the business man would discuss it with the artist, thus acting as the interpreter or intermediary between the very practical client and the artist. When the preliminary studies were completed, they would see the client together to discuss them, thus saving a lot of unnecessary study, work and talk, effecting a considerable saving of time and minimising the likelihood of blunders. If the client were more artistic than businesslike, then the procedure might be reversed, the artist being consulted before the business man.

This method is advised because all good architecture must be the result of a course of reasoning—the requirements of the work and the limitations of the site giving the plan, the plan speaking or outlining the elevations, and the character of the elevations fixing the detail. It is true that a building for a given purpose may be designed in a dozen different ways, but that difference will be like the difference between the individuals of a family rather than that between individuals of different families. It is necessary, therefore, that the requirements should be determined as exactly as possible to enable the artist to study his plan intelligently, and for this purpose the engineer's training should better fit him. The writer's experience makes him sanguine that the harmonious working of the two interests in some such way as is here outlined will soon become quite general, to the great advantage of the artist, the engineer and the general public.

The general public is also deeply interested in this question, since the buildings that such a combination would design and erect would be a decided advance on the usual thing. This is self-evident when it is stated, but it is rarely permitted to influence the choice of an architect, who is oftener selected because he is a good fellow, or a good artist, or is fashionable, or has the vogue, but not because his office force embraces a specialist for the solution of each of the problems, or because it is organised so as to handle everything in a strictly business way. Of course, we do reap a benefit from all of this in the friends that it is bound to make for us, but this is only because the results are satisfactory, and if the client should be of such a peculiar nature as to be constantly obstructing, then the results would not be so good, and the friction that would result in getting anything like a satisfactory result would make the client complain of a particularly good piece of work as much as if it were badly done.

If clients would recognise that the architect's best work is always done when in competition with himself, that the best man or firm for them to employ is that one whose work in its general character is most pleasing to them, and whose methods are such as to give the most satisfactory results, there would be far less trouble in the end, and the results would be buildings better adapted for their requirements. This would especially be productive of better results than the method for the choice of an architect outlined by Mr. Bernard McEvoy in the January number of the *Engineers' Magazine*. While this subject could better be treated in a separate article, still it seems appropriate to call attention to some of the more evident of the objections to Mr. McEvoy's plan of competition for selecting an architect.

First, the demand for detail in the study of the plans for the purpose of making the heating, sanitary and ventilation arrangements of any value, is such as to result in its exclusion from any terms of competition that a well-equipped architect would enter into unless he were well paid. With the terms thus modified the work could be competed for by any office boy who could handle a pencil, and this would result in the exclusion of the good men. Their demand for details to a $\frac{1}{8}$ -inch scale means nothing, since the scale is too small to be of any value for any purpose, and would only add work that would have to be done over again when the work was actually begun. Finally, such complete plans, assuming that they were drawn in good faith, without the expectation of any further study—a condition that would be impossible of fulfilment in any good office—would be still of no use, since there would be surely some detail that would be susceptible of improvement after Mr. McEvoy's committee and the architect had conferred together. It is the writer's belief that competitions are absolutely wrong in principle, that they are as much out of place in architecture as they would be in medicine, and that every architect should do his best to discourage them unless they could be so managed as to occupy a position analogous to that of a consultation of physicians.

After all, the results that we hope for must be the fruition of a growth of public sentiment having its birth among the professional men, then spreading through the medium of the technical press and technical societies until the end is attained. That our ideal is possible of accomplishment is certain, since we ask for no more than is accorded freely to the other professions, except in matters that we are remedying of our own

volution. When this is done, when artist and engineer labour harmoniously for the one end, forgetting everything but the result aimed at, and are intelligently seconded by the client, we will repeat in every city in the land, in a small scale, the splendid achievement of the White City on the shores of Lake Michigan.

THE LONDON SCHOOL BOARD COMPETITION.

THE following instructions to architects in reference to the approaching competition, prepared by Mr. Macvicar Anderson, have been approved by the Works Committee:—

The School Board for London propose to erect a school on a site in the parish of Plumstead known as the Speranza Road site, and they have resolved to invite architects to submit competitive designs for the same on the following conditions, viz.:—

1. A block plan of the site is supplied herewith to each competitor. The area available for school buildings, outbuildings, playgrounds and boundary walls is indicated by the light red tint and the figured dimensions. The levels are also indicated, and both the area as figured and the levels are to be taken as officially correct. The position and depth of available sewers are also indicated. The approaches are from Speranza Road and Saunders Road, and it is believed that there are no limitations in respect of ancient lights.

2. The buildings are to be designed so as to be thoroughly adapted to the work of school-teaching. Great importance will be attached to the excellence of the plan, the arrangements of which should completely satisfy the latest and most approved requirements of Board schools in London, and must be subject to and in strict conformity with the rules of the Education Department for planning and fitting up public elementary schools.

3. The school is to be designed to accommodate 1,200 children with all necessary classrooms, teachers' rooms, staircases, entrances, cloak-rooms, as well as lavatories and conveniences for both sexes. The usual proportion of 360 boys, 360 girls and 480 infants in such a school is regulated by the plan frequently adopted of placing one department over another in a three-storey building. Competitors are to understand, however, that they are not in any way bound to adopt this or any other plan, as it is desired that they should be left perfectly unrestricted in the treatment of the problem so long as they conform to the rules of the Education Department. In the event of the plan of a three-storey building being adopted, a separate hall must be provided for each of the three departments, but in the case of a one-storey building one hall only need be provided for the use of the whole school. The plan is to embrace a drawing classroom so arranged as to be accessible both for boys and girls, and with this exception no special or technical classrooms are required. A teacher's residence is not to be provided, but a schoolkeeper's house must be shown, also playgrounds and boundary walls. The conveniences for the two sexes must be apart from each other.

4. The following particulars are required in illustration of each design, and neither more nor less will be allowed, viz.:—

A block plan of the site, indicating the position of the school buildings, outbuildings, playgrounds, boundary walls, entrances and the arrangement, position, sizes and fall of the drains. A plan of each floor, both of the school buildings (the ground floor embracing the conveniences for both sexes) and schoolkeeper's house. On these plans the means of possible enlargement, so as to accommodate 1,600 children in all, are to be indicated by blue lines, such enlargement being shown on the plans only, and not on the elevations and sections. The plans are not to have any dimensions figured on them.

A plan of the roofs.

Elevations of the principal fronts of the buildings.

Sections—four in number.

The proposed methods of warming and ventilation are to be indicated on the drawings so far as may be practicable.

All the drawings are to be to the scale of 8 feet to 1 inch, except the block plan, which is to be to the scale of 20 feet to 1 inch.

No perspective views will be allowed.

No alternative design or alternative treatment of part of a design will be allowed, each competitor being restricted to one design only. The drawings are to be in ink, the walls on plans and sections are to be coloured red, the floor area on plans is to be tinted with a light wash of yellow, the woodwork on sections is to be tinted yellow, and the elevations are to be in pen and ink without colour of any kind. The drawings are to be on white paper of uniform size, each 30 inches by 22 inches, mounted on plain stretchers without frames or borders, the front of the stretchers being covered by the drawings.

5. The character of the architecture and the nature of the materials are left to the discretion of competitors, provided that in regard to the latter there is nothing that conflicts with the rules of the Education Department.

6. Each design is to be accompanied by a report giving a general description of the scheme and of the materials proposed to be employed, as well as of the suggested methods of warming, ventilation and sanitation. For the general guidance of competitors the standard specification of the School Board is appended hereto as schedule No. 3.

7. Each competitor is to submit an estimate of the probable cost of his design, including school buildings, outbuildings, boundary walls, playgrounds, desks, forms, fittings and furniture, and every branch and description of work required to complete the school ready for occupation. The cost must not in any case exceed the amount which the Education Department would grant as a loan, the basis of which is set forth in the Schedule No. 2 attached hereto. In pursuance therewith the estimate is to be stated thus:—

Cost of works, including the percentages (i) to (k) allowed by the Education Department, but exclusive of the items (a) to (h) in Schedule No. 2	£
Separate cost of items (a) to (h)	£

Total amount of estimate	£
--------------------------	---

8. The names and identity of competitors shall in no way appear. Each design is to be accompanied by a sealed envelope, containing the name and address of the author. Neither the drawings nor the envelopes are to bear any motto, device or distinguishing mark, but they will be numbered on delivery in the order in which they are received.

9. The School Board have appointed Mr. J. Macvicar Anderson, 6 Stratton Street, W., president of the Royal Institute of British Architects, to be their professional assessor and adviser in the competition.

10. The competitor whose design is placed first in point of merit by the assessor shall be paid a premium of 150*l.*; the competitor whose design is placed second shall be paid a premium of 100*l.*; and the competitor whose design is placed third shall be paid a premium of 50*l.* The first premiated design shall be the property of the Board, and all other designs shall be returned to their respective authors immediately after the public exhibition of the competitive designs, which the Board reserve the right to hold during a period not exceeding two months from the date of the award. The competitor to whom the first premium is awarded shall, in the event of the Board erecting the school shown on his plans, be employed as architect, and shall be paid in accordance with the schedule of professional charges published by the Royal Institute of British Architects, such payment being additional to the premium of 150*l.*

11. A deposit of one guinea will be required for supplying the instructions and particulars, which will be returned after the award has been made (should the applicant submit a design), or should he decline to compete and return the instructions and particulars within one month from the date of receiving them.

12. The following will be deemed by the assessor to be grounds for disqualification, viz.:—

(a) Any attempt on the part of a competitor to make known his identity, or to influence the decision of the assessor, personally, or through any member of the Board, or otherwise.

(b) The delivery of a design after the specified time, unless arising from accident in transmission, explained to the satisfaction of the Board.

(c) Any encroachment, however slight, beyond the limitations of the site as laid down and figured on the accompanying plan referred to in Clause 1.

(d) Non-compliance with the conditions respecting the drawings required, whether as to number, scale or style of execution.

(e) Material excess of cost in the opinion of the assessor beyond the outlay that would be sanctioned by the Education Department, referred to in Clause 7.

(f) Departure from, or non-compliance with, any of the conditions embodied in the foregoing instructions, the whole of which will be rigidly adhered to and enforced.

13. The parcel containing the drawings, report and estimate of each competitor, and the sealed envelope which is to accompany it, are to be addressed to

The Clerk of the Board,
School Board for London,
Victoria Embankment, W.C.,

and are to be delivered not earlier than May 29, and not later than June 5, 1893, between the hours of 11 A.M. and 4 P.M.

SCHEDULE NO. 1.

Rules of the Education Department for planning and fitting up public elementary schools, as set out in Schedule 7 of the code of regulations issued by the Education Department.

(Separate document.)

SCHEDULE NO. 2.

Statement of the conditions on which the Education Department authorise the Board to borrow money for the erection of schools.

* The Education Department grant a loan for each school not exceeding 10*l.* per head for each child accommodated, the accommodation being the number of places for which the plans, arranged in accordance with the rules of the Department, are approved. In the infants' department this accommodation is reckoned by dividing the superficial floor area of the rooms by eight, thus allowing 8 square feet for each child. In the boys' and girls' departments the arrangement of the desks, which is approved by the Education Department, usually works out to an area of between 10 and 11 square feet for each child.

The following expenditure need not be included in the limit of 10*l.* per head, viz. :—

(a) Foundations exceeding 4 or 5 feet in depth.
(b) Teachers' rooms, for which an allowance of 100*l.* per room is made.

(c) Drawing classrooms, for which an allowance of 1*l.* per foot super. of floor space is allowed.

(d) Schoolkeeper's house, for which an allowance of 400*l.* is made.

(e) Boundary walls, gates and tar-pavement of playground, the whole cost of which is specially allowed.

(f) Halls provided in connection with the school, for which an allowance of 1*l.* per foot super. of floor space is made.

(g) Glazed bricks, the entire cost of which is allowed.

(h) Playgrounds provided on the roof or underneath the school, where the site is of a very restricted area, the extra cost of which is allowed.

The limit of 10*l.* per head is, however, inclusive of the following percentages, viz. :—

(i) 5 per cent. on the contract amount for possible extras.

(j) 3½ per cent. on the contract amount for the expenses of the architect's department and the cost of the clerk of works, &c.

(k) 12*s.* 6*d.* per head (equivalent to about 7½ per cent. of the contract amount) for the provision of the furniture.

The net cost of the school buildings, therefore, exclusive of the items (a) to (h), should not exceed 8*l.* 12*s.* 6*d.* per head, so that with the above percentages (i) to (k) added, the limit of 10*l.* per head will not be exceeded.

SCHEDULE NO. 3.

Standard Specification (*Separate document*).

THE W. H. SMITH MEMORIAL WINDOW.

THE memorial window to the late Right Hon. W. H. Smith, in St. Margaret's Church, Westminster, subscribed for by members of the House of Commons, was unveiled on Saturday afternoon by Mr. Balfour. The subjects of the window, as suggested by Archdeacon Farrar, represent, in the central light, the figure of our Lord as the Light of the World, with right hand raised to bless, and with emblems of the powers of darkness under His feet, after the conception of the statue of Le Beau Dieu in Amiens Cathedral. In the light on the left hand is the figure of the centurion Cornelius kneeling in prayer, and in that to the right, Nathaniel is seated in contemplation beneath the fig-tree. In smaller panels below are predella pictures, on the left of King David playing the harp, in the centre Moses bearing the Tables of Commandments, and on the right Nehemiah superintending the building of the walls of Jerusalem. The cartoons were prepared by Mr. H. G. Murray, from sketches and studies of the principal figures by Miss Maud Seddon, after the design by Mr. J. P. Seddon.

Mr. Balfour, in a short speech, referred in appreciative terms to the character and career of Mr. Smith.

TESSERÆ.

The Early Abbey of Westminster.

ALL we know of the earliest history of the fabric is that there existed a church in the days of King Offa, and that this (or a successor of it) was rebuilt, and the abbey refounded by Edward the Confessor. One of the first thoughts which occur to us in considering the history of the Abbey is then the question as to what kind of church was that which preceded the present structure, and which we know to have been erected by this sainted monarch. As, for example, what was its size and form? Was it on the small scale which appears to have been common among Saxon buildings, or of the gigantic dimensions adopted by the Normans? And, again, was its architecture more on the Saxon or on the Norman type? William of Malmesbury, writing in the following century, speaks of it as "that church which he the first in England had erected in that mode of composition which now nearly all emulate in its costly expenditure," or, in other words, it was the earliest Norman church. Matthew Paris, in the thirteenth century, merely adapts the same statement to his own times, saying that the Confessor "was buried in the church which he had constructed in that mode of composition from which many of those after-

wards constructing churches, taking example, had emulated in its costly expenditure," evidently considering its style the same as that of the Norman churches with which he was surrounded. Sir Christopher Wren gives us, as he says, from an ancient manuscript, the following particulars :—"The principal area or nave of the church, being raised high and vaulted with square and uniform ribs, is turned circular to the east. This on each side is strongly fortified with a double vaulting of the aisles in two storeys, with their pillars and arches. The cross building, contrived to contain the choir in the middle, and the better to support the lofty tower, rose with a plainer and lower vaulting, which tower, then spreading with artificial winding stairs, was continued with plain walls to its timber roof, which was well covered with lead." From the above one would by no means infer that the church was of small dimensions, and it may have been nearly, or quite, as large in its elementary scale as the present structure. Edward the Confessor having spent so much of his early life in Normandy, it is unlikely that he should be content with the dimensions of a Saxon church. Indeed, had he been so, he had one to his hand without building a new one; and, as he was greatly enlarging the monastic establishment, it seems probable that in rebuilding the abbey church he would adopt the scale which was becoming common in England.

Dry Rot in Timber.

Seasoned or unseasoned timber alike are exposed to the cause of decay specially known by the name of dry rot, which is considered to arise from the development of several species of fungoid growth in the wood; or, according to Dr. Birkbeck, of the *Boletus*, *Agaricus*, *Lycoperdon*, *Mucor*, &c. It would seem as though some of the organic tissues of the wood (not the sap) decomposed under certain conditions of the surrounding atmosphere (as in close, damp, confined air), and that they thus furnish, as it were, a soil for the growth of the fungi, which in turn disintegrated the remaining portions of the tissues by their mere mechanical expansion in growing. The wood becomes, in fact, reduced to a mere powder, and may then be rubbed away by the finger, sometimes with a rapidity quite alarming. There is also this particular danger about dry-rot, viz. that the germs of the fungi producing it are carried easily and in all directions in a building wherein it once displays itself, without necessity for actual contact between the affected or the sound wood, whereas the communication of the disease resulting from the putrefactive fermentation, or wet-rot, only takes place by actual contact. It may possibly be the case that woods grown in certain soils are more exposed to dry-rot than others are, and that the germs of the fungoids are taken up by the spongioses of the roots; for timber grown in situations where large fungi abound are said to be more exposed to this disease (dry-rot) than those which are grown on dry, well-drained soils. At any rate, wood kept for any length of time in situations where it is exposed to become covered with fungi is very likely "to take on" dry-rot at an early period. Much of the timber arriving from the north of Europe leaves the ships in a state which seems to contain the germs of decay. The method of stacking the timber and deals in some of our docks is also often very dangerous. From whatsoever source the fungoid growth producing dry-rot may proceed, if once it should be recognised to exist in a building, the affected parts, and all the woodwork around them, should at once be removed. If the various processes for preserving timber should not then be applicable, great precautions should be observed to cut off the access of moisture and to insure a free circulation of air around the newly-fixed wood.

Sir C. Barry and Birmingham.

In response to the advertisement issued at the close of 1830 calling for designs for the Birmingham Town Hall, Barry forwarded a noble scheme for a Doric temple of grandeur, and at the same time of so much simplicity that his friends confidently averred that it might well be carried out for the 18,000*l.* which formed the limit fixed by the committee. Barry's plan was so long placed in the ascendant that he confidently reckoned on being employed to execute it. From first, however, it somehow sank down to third, and a design was at last adopted which, after utterly ruining the contractors, cost the corporation nearly double the amount to which they at first limited the outlay. Barry exhibited his design, which was much admired, in 1832. Nothing daunted by his bad luck with the town hall, Barry sent in designs (for the preparation of which two months only had been allowed) on November 1, 1832, for the Free Grammar School, commonly known as King Edward's, at Birmingham, which he won easily. This popular building, with its seven regular bays and bay windows breaking through two storeys at each end, was most carefully carried out in every detail and in a good collegiate style, in that most beautiful building stone Darley Dale, and gave great satisfaction. It was completed in 1837 at a cost of 39,263*l.* The study bestowed by Barry upon the working out of this building, and consequently upon the Tudor style generally, he found of the greatest possible service to him when subsequently called upon

for the Houses of Parliament competition. It was about the period of the completion of the Birmingham Schools that Barry became acquainted with Welby Pugin, whose talents he always greatly admired.

Magnesian Limestone.

Magnesian limestone is carbonate of lime and magnesia; ordinary limestone is simply carbonate of lime. Just as the common limestone when crystallised is very durable, so magnesian limestone when crystallised (in which case it is composed of equal parts of carbonate of lime and carbonate of magnesia) is in a more compact state than when earthy, and then seems to stand exceedingly well. In the districts where these stones are obtained, the churches built of them centuries ago are quite unaltered. But when the same stones are brought into our London atmosphere, although they appear to be just as good, and are exposed to very much the same influences, they begin at once to decay. It was owing to a neglect of the consideration of this matter that the magnesian limestone of Bolsover, used in the construction of the Houses of Parliament, has suffered so much. Magnesian limestone differs from common limestone in the way in which it decays. Whenever the two minerals are not perfectly crystallised together, it becomes disintegrated and powdery; so that in one block portions are found which are perfectly hard, and other portions near them which are also hard, whilst between them may be portions which are soft, and so disintegrated that the particles might almost be blown away by the wind. This has arisen from the way in which the material was originally crystallised, and from the difficulty that there is in producing a perfect crystallisation in a mass on a large scale in nature.

Measurement of Light Space.

In the measurement and proper distribution of light, several rules have been laid down by various authors, but scarcely any of a satisfactory nature. Palladio mentions that it appears to him proper, in conformity to the doctrine of Vitruvius, to divide the height of the side of the room into $3\frac{1}{2}$ parts, and to give to the height of the window two of these parts, and to the width one of these parts, less one-sixth. In another part he states that the window space should not be wider than one fourth the width of the room nor narrower than one-fifth, and that the height of each window should be one-sixth more than double its width; but there does not appear to be any rule or suggestion for the number of windows in the side of a room or the width of window opening in proportion to length of room. Morris, who in 1734 published his "Lectures on Architecture," &c., observes:—"Let the magnitude of a room be given. Multiply the length and breadth of the room together, and that product multiply by the height, and the square root of that sum will be the superficial contents in feet of the light space required." Gwilt, in his "Encyclopædia," allows one foot of glass to 100 cubic feet of room.

Encaustic Painting.

Encaustic painting in some form dates from the most remote antiquity. Sir Gardner Wilkinson states that "encaustic painting, with wax and naphtha as vehicles, was practised among the Egyptians," but there seems some doubt about the actual processes of its employment; it is enough, however, to know that wax was one of the ingredients used, and most likely the preservation of the examples noticed has been due to this. The Greeks practised it from a very early period. Pliny says of it:—"We employ wax as a vehicle of painting, not only from the beauty it gives to the pictures painted with it, but also because it is a preservative of the walls which it adorns;" and in another place that "Lysippus, the painter, executed a work of this kind at Egina, and that he put an inscription under it, stating that he had himself subjected the work to the action of fire." This proves that the ancient encaustic was really burnt in, as its name implies. Among the Romans encaustic painting, or at any rate painting with wax in some form, was very general; and it continued to be practised during the early centuries of Christianity, almost to the exclusion of every other mode, but after that time it seems to have fallen into disuse. Wax is not mentioned by Cennini, writing in 1437, except as a material for modelling, whence we may conclude that in his day the art had been lost; and Theophilus makes no allusion to it whatever. Lanzi mentions that "many old pictures were analysed by the celebrated chemist Pietro Bianchi, and they appeared to be painted in oil; and it was found that the oldest pictures, which were usually the most brilliant, gave indications of wax, but that no wax was found in pictures painted after the year 1360." In the appendix to the third report of the Commissioners on the Fine Arts, published in 1844, there is a description of "Methods of Painting adapted to Mural Decoration," by Sir Charles Eastlake, in which he says, speaking of encaustic:—"The precise process of this art among the ancients has been the subject of much controversy; but the actual remains of antique painting at Pompeii and Herculaneum, as well as numerous allusions in the writings of the ancients, prove that it was common among the Greeks and Romans. It was also occasionally employed during the Middle Ages." And again,

as the result of his own observation, he says:—"The advantage of wax as a vehicle is its durability. A wall painted white, partly with wax and partly with oil, exhibits the same tint for some days, but by degrees the oil colour darkens, and after some months the two portions are quite distinct; that which was painted in wax retaining all its brilliancy." He also quotes a description of the nature and advantages of wax as adapted for general painting by Dr. Roux, who observes:—"Colours, mixed with wax are entirely saturated by it. Wax and colours form together a more solid, less fusible substance than wax alone. The pigments remain closely united with the wax. No skin appears on the surface of the picture, even when the wax has been mixed in abundance with the colours."

Alan de Walsingham.

It may not have occurred to everyone who has admired the beauties of Ely Cathedral to think, or rather some may not have had the opportunity of knowing, that the principal Mediæval glories of Ely, perhaps the whole, were home-grown. The names of the architects of all the great works are not known; but the architect of the most remarkable portion, the central octagon and lantern, was undoubtedly a monk of the convent, Alan de Walsingham. It may be supposed from his name that he was not born in the isle, but came from Walsingham, in Norfolk, a place in those days much more famous than now. He would probably have come from his native village as a boy to Ely, and would never have gone much beyond the bounds of the convent, except to see those farms of which he had the care as a sacrist. But he was a man of genius, and circumstances favoured the development of his genius, though in a singular way. First he showed his love of art by making himself a goldsmith, and then he indulged the same love by turning architect. Many opportunities he found for the exercise of this art; in fact, the good old monk seems to have been constantly building one thing or another. He designed the lady chapel; he built that exquisite little gem called Prior Crawden's chapel and several other buildings of less note, but the grand opportunity for exhibiting his full powers occurred when the old central Norman tower fell in 1320. "It is an ill wind that blows nobody any good," and though the fall of the tower nearly frightened the monks out of their wits and emptied their pockets, it was (as we say) the "making" of Alan de Walsingham. Never was there a better opening, and Alan perceived it. He determined that he would have no more heavy towers, threatening to come down and keeping up a reign of terror, but he would recast the whole structure of the cathedral; and so he introduced that beautiful octagon which has been ever since one of the chief features of the building, and which may be reckoned amongst the prime results of Mediæval architectural skill.

Circular Churches.

The circular form of the Holy Sepulchre built by the Empress Helena at Jerusalem, rebuilt by Charlemagne in 813, was caused by its erection round a tomb: octagonal churches, such as those of Antioch and Nazianzum, like baptisteries, were built on symbolical designs. The church erected on the Mount of Ascension powerfully affected the Eastern mind, and became a model for similar buildings, the domes of which were inscribed with the grand words of the angelic salutation to the apostles. The dome was a necessary constructional development as the fittest covering for a round building. Constantine built the first round churches in the West, those of St. Constance and SS. Peter and Marcellinus, at Rome. In the interior of the latter and of St. George, Salonica, built by him, with its seven trigonal chapels; in those of the Holy Sepulchre; and in the eight little apses of the Church of the Apostles, at Athens; and of St. Vitalis at Ravenna, built by Justinian, we observe a singular resemblance to the chevet with its radiating chapels. An octagonal church, internally circular, occurs at Hierapolis, of an early date. Circular and polygonal churches are also frequent in Armenia. That of Etchmiadsin is a square, with a central dome and apses to each arm of the internally marked cross. In the Church of the Apostles at Constantinople, Constantine adopted the form of the Latin cross, as in the church of St. John Studius, and a central dome above the sanctuary; the nave had timber roof. However, the necessary construction of four pillars to carry the dome, and of vaults to the nave and transepts, led to the abandonment of the flat ceilings and roofs of the Latins. The circle or polygon was thus combined with the Latin cross, and the gammada or Greek cross arose from the combination of four gammas, the numeral designating the Holy Trinity. Arculphus describes a church of this form at Sichem, in the seventh century. The cupola in time was extravagantly developed, and the aisles reduced to narrow passages in the time of Justinian. St. Sophia, consecrated A.D. 557—of which the Emperor Justinian said, with a burst of emotion, "I have equalled thee, O Solomon!"—forms a square with an eastern apse and a central cupola, and the form of the cross is formed internally by two square halls on either side of the dome; a portico ranges along the entire front of the building, as at St. Vitalis, Ravenna.

NOTES AND COMMENTS.

IN his last report the Director of the National Gallery states the attention of the Treasury has been often called to the urgent necessity for enlarging the Gallery with the object of providing adequate accommodation for recently-acquired pictures in this collection. Although no definite answer has been received on this subject by the Board, the trustees and director observe with satisfaction that their request has not been overlooked. During an interview with a deputation from unemployed workmen in London on November 28 last, the First Commissioner of Her Majesty's Works stated that "a portion of the site formerly occupied by Millbank Prison would be exchanged with the War Office for land immediately behind the National Gallery and now occupied by barracks, and that the land thus set free would be available for the extension of the National Gallery, which could not be delayed much longer." Should this exchange be effected, the trustees and director suggest that it would not be necessary to postpone the commencement of building operations at the National Gallery until St. George's Barracks have been removed to the Millbank site. Even after devoting part of the present barrack-yard to the purpose required, a considerable space would still remain available as a temporary drill-ground, and in view of the fact that at least two or three years must elapse before the proposed additions to the National Gallery could be erected and ready for occupation, it is hoped that the preliminary work for those additions may be undertaken at the earliest possible date. The purchases during the past year are a painting by JAN VERMEER, of Delft—*A Young Lady at a Spinet*—which cost 2,400*l.*, and *Portraits of his Servants*, by WILLIAM HOGARTH, costing 162*l.* 15*s.* The donations numbered thirty-six. The number of visitors in the past year were 505,787, being a daily average of 2,443. On students' days there were 23,991 attendances, the daily average being 193 for oil-colours and 40 for water-colours. Four hundred and sixty-seven copies were made from foreign masters and 626 from British and modern masters.

IT would have some interest if we knew how often pictures were copied in the National Gallery for vending and how often for study. The twelve copies made of GREUZE'S *Girl with an Apple* and of *Head of a Girl*, we may assume, soon found purchasers, but who are the twelve amateurs for whom the copies of the *Vision of St. Helena*, by CAGLIARI, were ordered? Portraits of unknown persons are in demand. Eleven copies were taken from VANDYKE'S *Portrait of a Gentleman*, nine of FRANZ HALS'S *A Man's Portrait*, nine of REMBRANDT'S *Man's Portrait* and nine of his *Portrait of an Old Lady*. Of MORONI'S *Portrait of a Lawyer* seven copies were taken, and although the *Admiral Pulido Pareja*, by VELASQUEZ, is only a recent arrival in the Gallery, six copies of it were produced. ROMNEY'S *Lady Hamilton* is first favourite among the English portraits, for it was copied fifteen times, and his *Parson's Daughter* comes next with thirteen. Twelve copies were taken from GAINSBOROUGH'S *Portrait of a Young Man*. As year after year there is a similar preference for portraiture among the copyists, it is difficult to resist the doubt that the National Gallery is an aid to the production of family portraits. Let a man become wealthy, he will have no difficulty in discovering figures that will serve instead of ancestors and heraldic signs that will be a substitute for armorial bearings.

THERE are many legends associated with the fate of Troy which painters have neglected. Among them is that of HESIONE. She was the daughter of LAOMEDON, who was PRIAM'S predecessor. Like many men in all ages, LAOMEDON was ungrateful to a firm of builders who, by their works of masonry and earthworks, gave security to his city. He declined to carry out his agreement with them when the work was accomplished. But APOLLO and NEPTUNE (for they were the partners in the contract) were more powerful than he imagined. They could assess their own damages. APOLLO pleased himself by inflicting a pestilence. NEPTUNE demanded a victim for a favourite monster, and HESIONE was selected. HERCULES happened

to see her while he was on a filibustering expedition to Colchis with the Argonauts; he rescued the princess and destroyed the monster. LAOMEDON, out of gratitude, offered his racehorses to the hero. HESIONE wished to accompany the expedition, but it was decided that she was to remain in Troy, and the horses also, until the return from Colchis. A man who is dishonest in his building transactions never does much good, and when the time came for HERCULES to bring away the horses LAOMEDON would not part with them. HERCULES besieged Troy, killed the king and set PRIAM on the throne; HESIONE was given to TELAMON, the father of AJAX, and was allowed to bring her youngest brother with her. The interest in the story has been revived by the discovery last year of a wall-painting in Pompeii which represents one of the incidents. The subject was discussed at a recent meeting of the German Archaeological Institute in Rome. HESIONE, with her brother and a woman attendant, appear in the painting as if pleading with HERCULES for pity on the boy, who is clad in a dress of blue material. The hero is seated, and besides a lance carries a small crown of leaves. It is supposed that the manumission of the boy is sought, and that it will be granted in the form which was sometimes observed in Rome—that is, by touching him with a lance and placing a wreath on his head. The painting is not in a perfect state, but is sufficiently distinct to enable the subject to be made out, and there is not likely to be any opposition to the interpretation put forward.

FEW churches in Rome are better known than St. Maria in Ara Coeli, which stands on the site of a temple that was dedicated to JUNO, or, as some believe, to JOVE himself. The position on the Capitoline Hill was striking but difficult of access, and accordingly MICHEL ANGELO devised the great flight of steps, the Scala Coeli, which, as our readers are aware, is not an easy climb, for the artist, who was not strong in planning, has not allowed one landing-place to the one hundred and twenty-four steps, which, like so many of the columns within, are made up of materials derived from ancient buildings. The exterior of the church is very plain, for long ago it was despoiled of its mosaic decorations. The interior has interest for painters, for one of the chapels is adorned with frescoes by PINTURICCHIO. These have suffered through the explosion on Monte Verdi, as well as the building itself, but the works of restoration could not be undertaken until some important legal questions were settled. The church has become a national monument, and it was sought to derive the money for the work from the national treasury. When finance is at stake abroad there is an astonishing respect for old rights, and it was argued that the municipality of Rome, or the corporate and religious bodies who at one time held an interest in the church, should have the privilege of paying for the restoration. Even the canon law that is commonly held to be obsolete was appealed to. After discussions between lawyers it was discovered that whoever defrayed the expense might afterwards set up a claim to the ownership. Discretion therefore prevailed over economy with the Italian Government, and it has been decided that at least the frescoes will be restored as a public work, and that the commission will be entrusted to Signor BARTOLUCCI, under the direction of the art committee of the municipality.

THE subject assigned for the first stage in the competition for the Prix de Rome of Architecture was a hippodrome, an opportune subject, for as the building in Paris which bore that title has been removed, a substitute will probably be soon needed. Ninety sketches were submitted by the students of the Ecole des Beaux-Arts. The jury, consisting of MM. GARNIER, Comte DELABORDE, VAUDREMER, GINAIN, COQUART, NORMAND, DAUMET, PASCAL and ANCELET having made a selection, the following students were selected to take part in the second one:—MM. OLIVIER, SCHELLEKOPF, BERNARD (Camille), COLIN (Gaston), RIGAUT, BIGOT, CHARBONNIER, MARS, MAYEUX, PROY, GUESNIER, PRUDON, AUBURTIN, ARNAUD, LAVIROTTE, BERTHIER, GARNIER (Tony), CHESNAY, HULOT and HERAUD. Who can tell how many architects who will gain distinction hereafter are comprised in the list?

ILLUSTRATIONS.

DOORWAY, LYONS HOUSE, SURREY STREET.

THE region between the Embankment and the Strand, which forms part of the property of the Duke of NORFOLK, has during the last ten years undergone modifications which are remarkable. The old, commonplace houses have been succeeded by large blocks of buildings exemplifying later Gothic and Renaissance styles. Red brick and terra-cotta have been used, and the effect is enough to surprise anyone who was acquainted with the property a dozen years ago. It is to be regretted, however, that owing to the narrowness of some of the streets the buildings cannot be as much admired as they deserve. It will be seen from the illustration that the detail of the buildings will bear a vigorous scrutiny. The architect is Mr. JOHN DUNN. The illustration is from a photograph by Messrs. B. LEMERE & Co.

ENTRANCE HALL, ALTHORP.

ALTHORP has gained renown from the library enshrined in the house. But like many of the stately homes of England, it is not without architectural merit. The hall, as will be seen, is an example of a time when Italian prevailed, and is not without elegance in the detail, and the panels afford space for subjects which appealed to owners and visitors. The photograph employed was taken by Messrs. B. LEMERE & Co.

WAREHOUSE, 12-16 CLOTH FAIR, E.C.

THIS building is situate on the south side of Cloth Fair, and immediately in the rear of it is the church of St. Bartholomew-the-Great. On the right of the view next the old house shown (No. 11) is the new north transept and porch of the church opening out on this thoroughfare. The old building referred to is being taken down to improve the roadway; at present it projects beyond the new line of frontage. The other old house to the left of the view is No. 17, one of the few houses now remaining in the City having weather-boarded fronts.

The new building has four storeys, and is exceptionally well lighted; there is a good basement extending over the whole of the site. Fireproof floors are laid throughout on Mr. DAWNAY'S system, and he has carried out the constructional ironwork. The fronts are in stocks, with red brick arches, pilasters, mouldings and dressings; the carved work is in red rubbers, with some cut and moulded work; the ground storey is faced with salt-glazed bricks of a deep brown colour.

The whole of the works have been carried out by the builders, Messrs. W. BRASS & SON, of 47 Old Street, E.C., from the designs and under the superintendence of the architect, Mr. T. R. RICHARDS, of 25 Bedford Row, W.C.

GARDENER'S HOUSE, LONGFORD CASTLE, SALISBURY.

THE illustration shows a house just built in the park at Longford Castle by the Earl of RADNOR, for Mr. WARD, the well-known head of the Longford Castle gardens. It is built of local bricks, and roofed with Staffordshire tiles. The gables are of Messrs. LASCELLES' cement. The cost has been 850*l.*, and the work has been carried out by Mr. H. KITE, of Salisbury, from designs by Mr. G. HAMILTON-GORDON, A.R.I.B.A., of the firm of TAYLOR & GORDON.

BRISTOL CATHEDRAL.

THE Dean of Bristol has issued the following statement:—The condition of the fabric of Bristol Cathedral can scarcely be said to be creditable to the important metropolis of the West, in the heart of which it is situate. What meets the eye cannot but suggest unfavourable comparison with cathedrals in other cities of less note and resources. The tower, elder lady chapel and northern side of the cloisters are in a ruinous and even unsafe condition, and call imperatively for restoration. The internal arrangements of the choir are not, as must be allowed, in harmony with those of an ideal cathedral. Much has been done within recent years by the zeal and munificence of the citizens of Bristol in supplying the long-felt want of the spacious nave, the present use of which is

so fully appreciated, and by the addition of the western towers. The successful completion of these two important works affords evidence of the interest which the Christian people of the city take in the ancient and interesting mother church of Bristol.

Yet another effort, not less strenuous and united, is called for to make our cathedral worthy of its position as one of the great historical churches of our land. As the result of a public meeting, held in June, 1892, in the Merchant Venturers' hall, presided over by the bishop of the diocese, and influentially attended, it was resolved that the cathedral should be without delay restored. A committee, composed of prominent clergy and laity, was formed. The plans proposed by the eminent architect, Mr. Pearson, were adopted. Tenders were invited, and the committee have accepted that of Messrs. Cowlin & Son, of Bristol, for the restoration of the tower and lady chapel, the portion of the work requiring to be immediately taken in hand. It is a source of satisfaction to the committee to be able to entrust this to a local firm. They are anxious that the restoration of the cathedral should not be partial, but, as far as possible complete, and that the present opportunity should be used for securing so desirable an end. On the eve, therefore, of the commencement of the work, the committee are of opinion that the time has arrived when a more general and urgent appeal should be made to the citizens of Bristol for subscriptions towards a local object which, on every ground, religious and civic, cannot but commend itself to their active and generous sympathy. The sum required to cover the restoration of the tower, lady chapel, portion of cloisters, the internal rearrangement and fittings of the choir, a new organ and possibly a peal of bells, is approximately estimated at 20,000*l.*, of which about 6,900*l.* has been promised.

The committee are confident that, once begun in earnest, the citizens of Bristol will not allow a work which has for its object the glory of God, the jealous honour of His sanctuary and the enrichment of a city already abounding in proofs of Christian zeal and in specimens of great historic value and architectural beauty, to be impeded for lack of interest or liberal support.

It is obviously impossible in a city of such magnitude as Bristol to reach everyone by private solicitation. There must be many in our midst and elsewhere who, without being thus personally canvassed, will be glad and ready to contribute, either by a donation which, if desired, might be spread over two or three years, or, as has been suggested, in the form of special gifts, *e.g.* a new pulpit, fittings for the choir, stained-glass windows, choir-screen, restoration of the cloisters or some one particular portion of the work with which the name of the donor and occasion of the special gift might be identified.

The committee desire heartily to commend this good work to all who are interested in the preservation and restoration of Bristol Cathedral.

SURREY ARCHÆOLOGICAL SOCIETY.

AT the annual general meeting of the Surrey Archæological Society, Viscount Midleton presided. The annual report stated that in August last the Society received notice from the committee of the Croydon Institute to remove the museum from their buildings. The collection is now temporarily warehoused until some suitable home can be found for it. The number of members was 220 annual, 97 life and 3 honorary. During the year the Society had lost twenty members, and nineteen new members had been elected. The library still continued to increase, not only by the exchange of publications with other societies, but also by donations from members. To Mr. S. W. Kershaw, F.S.A., the Society was greatly indebted for a most valuable gift of books in memory of his brother, the late Mr. W. Kershaw, M.D. This generous gift placed the Society in possession of a complete set of the "Journal of the Royal Archæological Institute." The Council desired to tender to Mr. S. W. Kershaw the best thanks of the Society for this valuable gift. After payment of all outstanding liabilities, there remained a balance on the year's expenditure. The sum of 20*l.* received for life compositions during the year 1892 had been placed on deposit pending investment, but there still remained a sum of 95*l.* due to the reserve fund on this account. As the total reserve fund now amounted to over 400*l.*, and taking into consideration the fact that this sum of 95*l.* had been used during an emergency in the Society's affairs, the Council desired to bring the following resolution before the general meeting:—"That the debt of 95*l.* now owing to the reserved fund on account of life compositions be cancelled." The report was adopted, and the resolution recommended by the Council was agreed to.

Alderman Rymer said it appeared to him most unsatisfactory that the museum should be warehoused. As a Croydon man he should like to see the museum retained at Croydon, and he believed that if applied to, the Church Institute would place a room at the disposal of the Council for the purpose.

Mr. G. C. Williamson pointed out that there was already a

resolution on the books of the Council that the museum should be located at Guildford.

Mr. R. Nevill said that that was so, but there had been some difficulty in regard to obtaining the necessary accommodation at Guildford.

Mr. Williamson replied that the Guildford Corporation had offered a house for the purpose of the collection; and they would have the house on the decease of an old lady who was eighty-eight years of age, but whom the Corporation declined to turn out of the house. Meanwhile, the contents of the Guildford Institute, a larger collection than that of the Society, was also temporarily warehoused, waiting to be added to the Society's collection.

It was decided to adhere to the resolution to eventually place the museum at Guildford.

On the motion of Alderman Rymer a vote of thanks was accorded the President for his valuable services during the past year.

Lord Middleton said the vote was undeserved, for the work of the Society was carried on by the committee, and especially their honorary secretaries, who devoted themselves to the interest of the Society in a manner which was creditable to themselves and fraught with the greatest possible benefit to the Society. He thought they might congratulate themselves on the satisfactory position in which the Society had been placed, and he hoped that every member of the Society would use his utmost endeavours to bring in fresh recruits.

UNEARNED INCREMENT.

AN address on "Unearned Increment" was delivered by Mr. George Auldjo Jamieson to the Chartered Accountants' Society, Edinburgh. Increment, he said, was distinguished from income as the expansion of capital differentiated from its fruit. But it did not follow that increment, though passive, was spontaneous or sporadic. They might have increment due to energy employed in development, though that development might be incomplete and the enterprise as yet, therefore, unproductive. But such increment was not that in which they were concerned. Unearned increment was due to no energy, it was the fruit of no toil, that was to say, labour contributed nothing to its growth. Neither force of energy nor endurance of effort called it into being. Thus defined, the term unearned increment put itself at once into antagonism to some of the axioms of economics. Wealth did not grow spontaneously; wealth was either the wages of labour or the wages of abstinence, or as it was now better defined, the wages of waiting. If, then, wealth could be truly unearned, then all economic teaching was vain, and the foundations of morality were sapped, because they might no longer distinguish between the produce of labour and the winnings of the gambler. What might be regarded as the germ of the idea which had grown into what was called unearned increment was a passage in Adam Smith when he dealt with taxation. To some extent Ricardo followed up the idea, but it was not until after the fierce conflict of the Corn-law agitation had subsided, and when the prognostications of the fall in the value of land were disappointed, that the germ idea of Adam Smith germinated into the programme of the Land Tenure Association, to which in 1870 John Stuart Mill gave the high sanction of his approval and support. Mill's utterances were really the origin and foundation of the unearned increment. Lesser apostles of the creed repeated it, but Mr. Jamieson said it was not necessary for him to adopt the rôle of critic. The inexorable logic of fact had accomplished what no argument could effect. It was easy now to demonstrate why there could be no unearned increment when, as Thorold Rogers had said, there was no increment to call either earned or unearned, but it was rare that so swift and so complete a refutation of an economic fallacy was provided as an object lesson to teach caution and to warn economists against building systems on the fleeting foundation of political passion and prejudice. But it was not to be supposed that because the vast increase on the value of land which took place between 1855 and 1875 had passed away, there was nothing to which, if sound, the theory could apply. The value of land in the vicinity of towns and of new seats of mining or manufacturing industry rapidly rose as the demand for human accommodation increased, and the growth of such values arrested and challenged public attention, and it was from such cases that startling instances of unearned increment were now derived. The bloated landlord had passed away; it was the ground-renter and superior that remained. When a piece of ground was found which had attained a value far beyond its normal and intrinsic value for the primary purpose of agriculture, there were two reasons for, or causes of, the abnormal growth which must be recognised—first, what was called good luck or good fortune; and, second, foresight and skill. What men in usual parlance called good luck and good fortune was in economic language foresight wedded to opportunity. But the main element was that of interest. After justifying the exaction of

interest, he said that the modern bogie man of unearned increment was revealed as the ancient chimera of usury, and that the proposals so frequently made to expropriate the unearned increment were proposals to deny to foresight, skill and abstinence the wages to which they were entitled, just as of old interest was prohibited. There were two points which seized on public sentiment, and obscured the real issues, and on both there had been an unwise obstinacy which had propped up this tottering idol of the market-place. These were the rating of ground-rent and feu duties for municipal purposes, and the taxation of vacant building ground within municipalities. No one in that room would maintain that the taxation of feu duties could affect the community. A house was not more valuable because it was burdened with a feu duty than the adjoining house of the same rent whose owner had acquired the fee simple; but the question which remained was enough to offend public sentiment, although it was a duel only between two classes of owners. Why should the owner of the soil on which a human dwelling was erected be exempt from all charge for protecting that dwelling, and making it safe and fit for human habitation? Because, it was answered, the owner of the building had undertaken to defray all such charges, and to pay the feu-duty free of all deduction. But the contract made was probably made in ignorance on the part of both of the necessity of doing much to make land fit for human habitation that was now found essential. It was not easy to answer the objections, and the attempts to reply had not been very successful, being little more than the protest of those who owned feu duties that they preferred not to be taxed; and the feeling of resentment against the phantom unearned increment was kept alive by the injudicious tone of those who were supposed to enjoy the passive wealth that grew and was not made. The other leg on which the phantom stood was the refusal to assess at its true increment of value unoccupied ground in municipalities—land meant for building—and kept year by year for increased return. There was really no theoretical answer to the demand that such land should be taxed at its true value. The practical difficulty of making it amenable to taxation was very considerable. Such land could not be rated without supplying it with all that the rates provided, and there was a certain unfairness in levying rates from property which as yet required little to be spent on it. But the principle of imaginary rental had been introduced of late, and the principle of classification was reorganised, and uniting these two principles, there should be no difficulty in making unbuilt land contribute its fair share to taxation. It was not salutary in the public interest that the owners of such land should be enabled to bottle it up for future use, exempt from the burden of contributing to those rates to which was in reality attributable its growing value. If these two anomalies were removed, the unearned increment of building land would be buried alongside the late lamented unearned increment of agricultural land, and one of the most remarkable delusions of modern economics would be consigned to the grave, where usury and regulated markets and Acts against forestalling and regrating lay forgotten. For there was no increment that grew, no wealth that was not made; and it was the making of wealth that gave it its value and zest. Whatever emulated creation gratified man; and as there was no matter that was uncreated there was no increment of wealth that was unearned.

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

THE PALACE OF THEODORIC AT RAVENNA.

IT was politic on the part of Roman emperors to allow the world to believe that they were surrounded by divine protection while on earth, and in due course were to have thrones among the gods. But personally they were too well convinced that any slave with a bare bodkin could put an end to all their greatness. Ravenna owes its existence to imperial apprehensions. When Alaric and his wild hordes descended on Italy, Honorius the emperor fled from town to town. He declared in the usual royal style, "Nec me timor impulit ullus," but the brave words must have sounded strangely to the guards that surrounded the imperial litter. When Alaric returned to the North, Honorius used the opportunity to provide a refuge for himself in case of another invasion. He fixed upon Ravenna, which possessed the advantage of being surrounded by marshes that in parts remain as difficult to cross as any Irish bog. With all its disadvantages, the place was so difficult to reach that it was no less appreciated by the successors of Honorius, and up to the eighth century Ravenna might be considered as the true capital of Italy. In the great contest between Odoacer

and Theodoric the city was so ably fortified that it sustained a siege of nearly three years, and was at last reduced by famine.

When Theodoric the Ostrogoth ruled in Ravenna it was visited by ambassadors from most countries of Europe, as well as by barbarian chiefs who were equally anxious to secure the friendship or tolerance of the king. Although he had gained his power by arms, during the thirty-three years of his reign he devoted himself to the task of bringing order into chaos by peaceful means. At a time when cultivation of the earth was despised as fitted only for slaves, he worked on his fields. All the arts of peace flourished under him. He enriched with buildings and public works not only Ravenna, which was his capital, but Verona, Pavia, Naples and other cities. On his visit to Rome Theodoric was astounded with the works which remained, and he exerted himself to preserve them. We are told by Gibbon that "edicts were framed to prevent the abuses, the neglect, or the depredations of the citizens themselves; and a professed architect, the annual sum of two hundred pounds in gold, twenty-five thousand tiles, and the receipt of customs from the Lucrine port were assigned for the ordinary repairs of the walls and public edifices. A similar care was extended to the statues of metal or marble of men or animals. The spirit of the horses which have given a modern name to the Quirinal (Monte Cavallo) was applauded by the barbarians; the brazen elephants

nothing in the character of the details which would throw a doubt upon it. In the semi-classic style of the doorway, and in the little arcades against the upper part of the walls, it bears a sufficiently strong resemblance to the tomb of the monarch, of the date of which no reasonable doubt exists.

The palace is described as having been originally of much magnificence and extent, but Charlemagne despoiled it, pulling down and removing with no sparing hand its columns, mosaics and other decorations, in order to contribute to the splendour of those edifices with which he adorned the more favoured parts of his empire. Among the embellishments so removed was an equestrian statue of Theodoric, which was conveyed to Acquisgranæ, or Aix-la-Chapelle.

The façade is built almost wholly of bricks, a material which appears never to have fallen into disuse in Italy, although in England we have little evidence of its having been manufactured for the builder's purposes during a long period of time. The two circular apertures in the lower part of the front appear to be modern; and the porphyry sarcophagus, which is let into the wall on the left of the doorway, is said to have been removed in recent times to that situation, on being found near the mausoleum of this monarch, whose body it was believed to have contained.

The large coved recess or niche over the entrance is a very

THEODORIC'S PALACE AT RAVENNA.

of the Via Sacra were diligently restored; the famous heifer of Myron deceived the cattle as they were driven through the Forum of Peace; and an officer was created to protect those works of art which Theodoric considered as the noblest monument of his kingdom." Lovers of ancient literature will, however, consider that the king's efforts to preserve works of art was a poor compensation for his murder of Boethius, the author of the "Consolation of Philosophy," and who was "the last of the Romans whom Cato or Tully could have acknowledged for their countryman."

One of the famous mosaics in the church of San Apollinare Nuovo, which are supposed to be the work of the sixth century, represents Theodoric's palace in Ravenna. There is a projecting centre of three arches, surmounted by a pediment, and with a double arcade on either side. It does not correspond with the building which is pointed out to the visitor as the only remaining portion of the palace known to have been built and inhabited by the Ostrogoth king. There is most satisfactory proof of the palace having stood on the spot, but with what degree of truth the present building is asserted to be part of the original work it would now be very difficult to ascertain, but the supposition is very generally received, and there is

peculiar feature, and may be observed in other buildings of Italy. It may also be noticed as previously occurring in some structures of the age of Constantine, and may have been perhaps originally suggested by those deep recesses that contribute so much to the effect of the interior of the Roman Pantheon, a building in all ages regarded as an object of wonder and imitation.

The small columns set in a square rebate, worked at the angles of the coved recess and supporting a plain semicircular arch, may be seen in most of the earliest Norman buildings, as well as frequently on the Continent; and it is worthy of note that this particular application of a column, for which no authority can, it is supposed, be produced in any work of Classic art, may be observed at the Zizza, a palace of the Saracen emirs at Palermo, where the small shaft, so placed, is made to support an entablature carved with a rich frieze of Cufic characters. It is interesting, says Mr. Smirke, to observe the gradations from this simple insertion of a slender circular shaft in a square rebate, to all those complicated moulded jambs with which it delighted our ancestors to enrich their doorways and windows.

Other points of resemblance which this building presents.

to those of after times will be apparent on the most cursory inspection: the projecting piers on each extremity of the front may be considered in no other light than as buttresses, whilst the series of arches in relief against the face of the wall may be at once recognised as a great advance towards those ranges of simple or interlaced arches springing from small columns, which form perhaps the strongest characteristic of the subsequent architecture of Europe. As a favourite mode of exterior decoration, especially on the apses of churches, they may also be seen on many very early buildings. The specimens of what is usually styled Lombardic art have them almost invariably, and although the Lombards are probably as little deserving the honour of having originated a style of architecture in Italy as the Goths are of having done so in England, and that generally speaking the buildings attributed to them are the works of later artists, yet there can be at least as little doubt but that a great number of the buildings in the style alluded to, which are to be found in Italy, and which present, in their general appearance, a near approximation to the churches of the Normans, were erected long before those Northmen had left their ships, or thought of any pursuits but those of war and rapine. These diminutive arcades which occur over almost the whole of Europe sometimes appear interlaced; and it was to a comparatively late instance of them so arranged in Hampshire that it has been imagined that the true origin of the Pointed arch might be traced, an idea which can alone be attributed to the limited range to which researches into the history of architecture were formerly confined.

In seeking to cultivate our knowledge of this history, no period nor country ought to be indifferent to us. The Ravenna palace, it is true, is without any architectural charms to attract our regards, nor can any of the structures of the sixth century lay claim to a great share of pictorial merit; but they do not deserve the neglect and contempt with which they are too often passed over: they are interesting as holding a middle station between the buildings designed in the ancient Roman style and those which in England are termed Norman, and may be regarded as the timid and feeble efforts of art during its period of greatest depression and debasement.

LONDON IMPROVEMENTS.

A COMMITTEE of the London Owners' Association, of which Mr. J. Whittaker Ellis is chairman, and Mr. J. G. Metcalfe secretary, have issued the following important statement concerning the proposals of the London County Council, which will involve a new taxation of all rents and annual values in London.

The London County Council are promoting, in the present session of Parliament, amongst other bills, the following for the special taxation of owners of real property in London:—

1. The London Owners' Improvement Rate Bill, which proposes to levy a rate upon all owners of lands and tenements within the administrative county of London to an amount not exceeding 4d. in the pound. The rate is to be, in effect, an addition to the property tax to be paid by the leaseholder or occupier of the house, and to be deducted by each payer of rent *pro rata* only from every receiver of rent. Thus every receiver of rent will be charged 4d. in the pound in addition to the existing income tax. The proceeds of the rate are to be devoted to expenditure upon improvements, including future repayments of capital borrowed in the past as well as repayments of capital borrowed in the future. Unoccupied houses and buildings and vacant land are to be rated. No regard is to be paid to any existing or future contracts with respect to the payment of rates. Although this bill has, as a private bill, been ruled out of order by the Speaker of the House of Commons, notice has been given that it will be introduced into Parliament as a public bill.

2. The London Improvements Bill, which involves a total outlay estimated at 5,327,765*l.* upon the following works:—

New central street and subsidiary streets	3,869,550
Approach to Tower Bridge	436,000
Widening of Wood Lane, Hammersmith	47,215
Vauxhall Bridge...	484,000
Rotherhithe and Ratcliff Ferry	443,000
Widening approach (south side) to Woolwich Ferry...	3,000
Cost of sites for rehousing displaced persons...	45,000

Total : ... 5,327,765

By this bill, dealing with the above-mentioned improvements, it is proposed to levy "betterment" charges upon owners within areas adjoining each of these improvements, except the widening of Wood Lane, Hammersmith, in addition to the general improvement rate mentioned above. Lands within the defined limits in the neighbourhood of each improvement are to be liable to the "betterment" charge to an extent representing "one-half of the amount which in the opinion of the Council will be the enhanced value or benefit derived or to

be derived by the said lands from the improvements." The Council are to have power to assess the charge by means of a provisional award within seven years after the completion of the improvements. The provisional award is to be subject to an appeal to an arbitrator appointed by the Local Government Board, but no appeal to a court of law is to be allowed. The charge may be apportioned "between the freehold and any other estate or interest in the lands."

The proposals of the London Owners' Improvement Rate Bill are entirely unprecedented, but the principle underlying the bill has been decisively condemned by the Town Holdings Committee of the House of Commons. The Committee state, in their final report, presented in 1892, after examining the whole question of expenditure upon metropolitan improvements, that "no sufficient cause has been shown for interfering with existing contracts relating to the payment of rates, and the methods proposed to the Committee for altering such contracts would be unfair, and would inflict injury without any compensating benefit."

The "betterment" theory has been twice embodied in bills by the London County Council, and twice rejected by committees of the House of Commons.

The effect of the proposals of the London County Council would be to seriously diminish the existing check upon extravagant expenditure on the part of that body. At present members of the County Council are to some extent restrained by the knowledge that the cost of any increase in expenditure comes out of the pockets of their constituents, and their object evidently is to throw the greater part of the burden upon those who have no voice in electing the Council.

The London County Council seek to force their schemes upon the Legislature by refusing to carry out the necessary public improvements unless their proposed changes in the law of rating are sanctioned, to arrogate to themselves the prerogative of the Legislature by increasing the income tax on rents, and to stifle discussion and public opposition by introducing (as already stated) a bill affecting large public interests as a private bill.

The attempt to introduce sweeping changes into the general law of taxation by means of private bills is grossly unfair to the owners and occupiers affected. On the one hand, the London County Council, having the ratepayers' money at their disposal, are not deterred by any consideration of Parliamentary costs. A great deal of the ratepayers' money is wasted upon bills seeking rash alterations in the law. On the other hand, the expense of an opposition in Parliament is so great as to deter most of the private persons who have a *locus standi* from appearing by counsel.

It appears to be sufficiently obvious that, unless owners as a body take common action in the shape of a new organisation or committee for the express purpose of opposing these bills, the schemes of the London County Council may be passed; but that, on the other hand, if the case of landowners of every class is protected by an organisation with adequate funds and duly represented before any committee to which the bills may be referred, there is reason to hope that the bills may be defeated, or, at all events, rendered practically harmless.

TRADES UNIONS AND BUILDERS.

THE action taken by Mr. Joseph Temperton, builder and merchant of Hull, against the officers of three trades unions consisting of workmen engaged in the building trade, has been tried at Leeds before Mr. Justice Collins. The following report is taken from the *Leeds Mercury*.

Mr. J. W. Lawson and Mr. Montagu Lusk appeared for the plaintiff; the former explained the grounds of the action.

Mr. Joseph Temperton, the plaintiff, bore out the opening statement of his counsel. He used, he said, to make from 40*l.* to 50*l.* a month; but since August last he had only made 15*l.* or 16*l.* a month, with people not connected with trade societies.

In cross-examination by Mr. Robson, the plaintiff said he was a master builder, but had only joined the masters' association in October last.

Have there been some complaints among the men about jerry-building?

The Corporation of Hull looks so well after builders that there is no such thing.

Were you not aware that both masters and men were agreed about a rule which should stop jerry-building?

No. He had heard, the witness said, in answer to other questions, that the president, secretary and four other members of the masters' association had signed the men's rules. He did not, however, know that the fact had been advertised in the papers. He had not heard it said that the only way to prevent "scamping" and "sweating" was to make master builders do the work themselves, and forbid sub-contracting. He did not know that in 1892 there was a rule for masters and men directed against sweating.

A discussion here took place between counsel and his

lordship, which resulted in the judge stating that he was prepared to rule that to induce persons not to deal with a particular person was actionable.

The witness, cross-examined by Mr. Tindal Atkinson, said that he did not know he was offending against a rule.

By Mr. Walton: He never heard that Myers & Temperton sweated their men. On the contrary, the men refused to come out at the invitation of the boycotting committee.

Mr. J. C. Brentano, builder, Hull, said that some time last August he gave an order to the plaintiff to supply some cement to him of the value of about 40% or 50%. Only a portion of this was supplied, as he could not take the remainder, owing to a resolution which had been passed by the Bricklayers' Society. Witness attended a meeting of the joint committee of the trade societies, and stated that he had a contract with Mr. Joseph Temperton. Mr. Russell, one of the defendants, was present, and pointed out that the trades union had a dispute with the plaintiff, and a resolution was passed not to allow the union men to fix his goods. Witness argued that it was unfair to him, as his contract was made before the resolution was passed. He consented, however, to wait for a fortnight, knowing that if he did not his own workpeople would be withdrawn. Subsequently the union told him he must get his goods from some one else, and he did so."

The resolution referred to was at this point put in. It was in the following terms:—"Resolved that this committee advise the three societies to abstain from using any lime supplied by merchants who are supplying any builders who are working contrary to the joint working rule No. 9, and further, that they refrain from handling or fixing any artificial stonework made by any man who is working contrary to rule No. 9."

Mr. James William Gibson, also a builder at Hull, said that Russell had told him they intended to take "extreme measures" with regard to Mr. Temperton's goods. He refused to give up trading with the plaintiff, and his men came out on strike. He afterwards decided to break his contract with Mr. Temperton, and his men then came back to work.

Evidence to the same effect was given by Mr. John E. Woods, Mr. Charles Scott, Mr. J. Townsley, Mr. Edward Good and Mr. W. T. Robinson, builders, and Mr. J. G. Hearfield, lime merchant.

Mr. Joseph Ward, master slater, said he was fined 5% for a breach of the rules of the Operative Builders' Society in trading with the plaintiff, and the defendant Russell gave him a receipt.

In cross-examination, the witness acknowledged that the defendants said there had been expenses incurred in connection with the calling out of his men, and it was only fair if they excused the breach of the rules that he should pay the expenses.

Mr. John Myers, of the firm of Myers & Temperton, stated that after the action of the defendants they could not get any lime direct from the Hull lime merchants. They did get a few loads by other people ordering them.

Mr. Walton: Then you were running the blockade?—Yes.

This concluded the case for the plaintiff, and Mr. Robson, on behalf of his clients, submitted that the plaintiff had shown no case on any of his grounds of complaint. There was no evidence, he said, to show that the defendants had endeavoured to get the men who were subject to their influence to break any contract or service into which they had entered. The customary notice of an hour had been given.

His lordship: I did not understand that to be put forward.

Mr. Robson said that the next ground of complaint he understood to be that the defendants had procured various persons who were masters to break contracts for goods sold into which they had entered. He held that the workmen had a right to withhold their labour from any employment, and they need allege neither a reasonable cause nor a philanthropic motive for doing so. There was no evidence to show that the defendants had done anything of an unlawful nature; and if any injury had resulted from the action they had taken they could not be held responsible for it. The question of malice, he maintained, could not possibly be considered when once the motive of the parties was made clear to be legitimate and proper. If the men could not withhold their labour under circumstances such as had been described, he failed to see of what use the Trade Union Act was.

Mr. Atkinson submitted that on his clients' behalf there was still less ground for the case going to the jury. There was not a tittle of evidence to show that they knew anything whatever about the existence of the contracts referred to. Nor was there a tittle of evidence to show that Russell was acting as the agent of his clients in going round to these persons and using threats or making statements which either induced, or were intended to induce them to break their contracts with the plaintiff. Nor was there anything to fix the responsibility for the resolution on his clients.

His lordship pointed out, however, that from Mr. Brentano's evidence there was proof that the defendants knew of the existence of the contract.

Mr. Robson: A combination to boycott a person in the absence of coercion or violence had never been held to be actionable.

His lordship: It has in Ireland, I believe, been held that boycotting is a crime.

Mr. Robson: That refers to agrarian matters. I don't think it has been laid down by law.

Mr. Montagu Lush drew his lordship's attention to a case in Ireland, decided by Chief Baron Palles, the Queen v. Heaphy, in which damages for boycotting were upheld.

Mr. Lawson Walton mentioned also the case of two men in England who had been sentenced to three months' imprisonment for boycotting a cattle dealer.

After the counsel for the defence had finished their arguments,

Mr. Lawson Walton replied, and maintained that there was ample evidence that all the defendants, with these contracts under their observation, put into effect their resolution, notwithstanding that the contracts existed. It was clear there was a conspiracy in this case to cut off the whole of Mr. Temperton's trade.

His lordship decided that there was evidence to go to the jury against all the defendants, and the Court then adjourned.

On Wednesday Mr. Robson opened the case for the defence of his clients, Russell and Stephenson, who were attacked as trades unionists for a course of conduct which was not merely for the benefit of themselves, but for the trade generally. It appeared that for some time there had been complaints in Hull about jerry-building, which was rendered easy in that town by a system of sub-contracts. In cases where the master builders did the work themselves there was some guarantee that it would be well done. The letting off of the work in sub-contracts led to the introduction of the system of sweating. The workmen passed a rule on the subject which the master builders agreed with, and decided that they would not work for any employer who contravened it. In this case the defendants had simply endeavoured to enforce a beneficial trade rule by the exercise of their undoubted right to withhold their labour, and induce others to do likewise, from men who acted in opposition to the rule. Those who were called leaders in trades union matters were often quite as much followers as any of their party, and it was so in the present case. The defendants, though the leaders of the union in question, were forced on behind by the members of their union, who were enthusiastic and had been for years in their demand for the abolition of the system of jerry-building which was fostered by sub-contracting. He argued that nothing of the nature of an illegal act had been proved, and until that was shown the defendants were entitled to a verdict. The question of fines had simply been imported into the case with a view to prejudicing it and to bolster up a bad case. If the fines were illegal and improper, it was in some other court that the persons fined had their remedy. The case, Mr. Robson said in conclusion, was one of supreme importance, involving very grave public issues. There had been no more intent to injure the plaintiff than there was in every trade dispute. In every dispute one man gained his end at another's expense, and therefore in every case there was a certain amount of injury inflicted. Competition in trade inflicted injury one on another, but that was no ground for interfering with the course of trade. Neither was there any ground for interfering when persons were seeking to carry out a legal and proper trades union purpose.

Mr. Chitty, for the rest of the defendants, intimated that he should not call any witnesses, and would not therefore address the jury at that point.

The only witness for the defence was one of the defendants, Mr. John Russell, president of the Hull Operative Bricklayers' Society, who said that for some time there had been a discussion going on in Hull about jerry-building, and he had raised the question both in the Town Council, of which he was a member, and in the society. Rule No. 9 was agreed upon for the purpose of putting down the evil, and on June 1, 1892, it was signed by the president and several representatives of the Master Builders' Society. He then detailed the negotiations which had taken place between his society and the plaintiff with regard to breaches of that rule.

Cross-examined by Mr. Lawson Walton, the witness said that those men employed by Messrs Myers & Temperton who refused to come out on strike when told were afterwards fined and expelled the society.

You used the most drastic measures you could?—It was merely a question of reciprocity.

In answer to further questions, the witness said there were about a thousand men altogether in the societies in question, but he denied that their withdrawal would be enough to stop the trade of any man engaged in the building trade. In the action they took their object was to protest, by the withdrawal of their labour, against any man breaking their rule, and to make him conform to the rules of the society.

You tried to make him conform to the rules of the society?—Yes.

Do you now say that Mr. Joseph Temperton ever broke any rule of the society?—Certainly.

Did you say to one of the masters that you intended bringing Joseph Temperton to his knees?—No.

Mr. Robson having summed up his defence to the jury,

Mr. Chitty, on behalf of the other four defendants, said there was a distinction to be drawn between the defendants for whom Mr. Robson appeared and his clients. The resolutions complained of were passed by the Operative Bricklayers' Society, and his clients were in no way responsible for or affected by trade resolutions. The jury must, he urged, find that each of the defendants individually had implicated himself in any illegal proceedings which might have taken place before they could find for the plaintiff. The proceedings had, however, been quite within the rights of the defendants, and no cause of action had been proved.

Mr. Lawson Walton addressed the jury on behalf of the plaintiff, and agreed with the counsel for the defence that the case was one of enormous importance to both sides. It was of importance to traders because, if Mr. Robson's contention was true, no trader could continue to exercise in his trade, in the face of the opposition of a labour combination, that right which was part of the birthright of every citizen in this country. If Mr. Robson's view of the law was correct, those who embarked in trade did so subject to the control of these organisations of labour, which might be formed, not only in their own trade, but in all industries connected with it. It was an important case also to the defendants, for if their contention was correct, there would be no limit to the despotism in relation to trade dealings. He asked the jury to negative the argument of the defendants, that the plaintiff was there to complain of the exercise by certain persons of their right to sell their labour in whatever market they pleased. The truth was that the workmen, led by the defendants, had not merely refused to work for the plaintiff, but had also cut off all his business and the materials necessary for his trade, and this he contended was neither legal nor fair.

His lordship, in reviewing the whole case to the jury, put to them the following questions:—(1) Did the defendants or any of them maliciously induce Brentano, Gibson and Woods, or any of them, to break their contracts? (2) Did they or any two or more of them maliciously conspire to induce the persons named and others not to enter into contracts with the plaintiff, and were such persons thereby induced not to make such contracts? With regard to the question of malice, he said that if a person induced another to break a contract, of the existence of which he was aware, in order to hurt a person in his business, to hamper him or to put undue pressure upon him, the law considered the act a malicious one. To conspire was to act together with a view to bring about something either unlawful in itself or to bring about a lawful thing by unlawful means. If they concluded that these persons, with a view to injure the plaintiff, conspired for the common purpose of inducing as many people as they could control not to deal with him, with a view to injure him, that, in his judgment, would be a wrong, and if they were of opinion that they succeeded in their object so as to damage him, then it was an actionable wrong.

The jury, after suggesting to his lordship that they should receive more remuneration than that usually allowed, retired to consider their verdict. After an absence of half an hour they returned into court with an answer in the affirmative to each of the judge's questions, and awarding the plaintiff 250*l.* damages.

Mr. Lush applied for judgment for the amount given and for an injunction to restrain the defendants from endeavouring to induce anybody to break contracts with the plaintiff or to prevent persons entering into contracts with him.

His lordship: Yes, certainly.

Both Mr. Tindal Atkinson and Mr. Robson applied for stay of execution, the latter gentleman remarking that there was no doubt there would be an appeal.

His lordship granted stay of execution on the condition that the 250*l.* was paid into court, and that it should not apply to the injunction.

THE LANGUAGE OF ARCHITECTURE.

IN the concluding lecture of the Oxford Extension series on "Architecture as the language of the English people," delivered in Bath, Mr. C. R. Ashbee said that in studying the history of architecture they found the thoughts and ideas of each race expressed in stone as the most permanent of records, hence the expression—the language of architecture. It did not apply only to their own country, but to all countries, and equally everywhere. Architecture was the language of the arts and it, above all others, was the language of the country in which it appeared. In every country architecture developed and worked up to a climax. Though at the present day the language was inarticulate and confused owing to the amount there is to tell, it was none the less expressive. One might

almost say there were two kinds of people who build buildings. There was the architect proper and the jerry-builders, and certainly a vast portion of the work of the present day was that of the jerry-builder. There was some consolation in the thought that although the latter did express the language of the time it would not be a very lasting or loud one. It would all end and finish at the end of the 99 years' lease. But the works of the architect of the present day would be for future time, and its peculiarity was its eclecticism. By that he meant the picking and choosing out of many styles, and that was expressed both personally and nationally. The lesson that the study of architecture might teach them as individuals was better taste. If they got to see the connection between things thought and work produced in the past they might try and express their nobler thoughts in better production at the present day, and the highest form of production was architecture conceived, not as a domestic convenience, but as an art—the mother art. With respect to his remark that it might teach them as individuals better taste, he said they were one-sided in their education. They were very particular about their literature, they read a great deal and professed to think a great deal; they cultivated the intellectual side, but had done very little as yet for the other side, which was the side that made for beauty. Puritanism had probably made them the great nation they were against and beside their neighbours abroad. It had also made them encourage and develop the intellectual side, and it was this, the classicism which came at the time of the Renaissance together with Puritanism as the study of the people, upon which their modern education in great part was based. On the other hand, they lost sight of their development as human beings, lost sight of the study and the feeling of what was beautiful for what was noble in beauty as beauty, and that was what they were trying, what they had been trying for the last fifty years to get back again. If they could only make their education more harmonious, not only to read the books that were good, but to look upon the things that were good, they would be doing quite as much for their children as if they only taught them to read what was good in books. There was another side of their nature which had to be developed and trained, and it seemed that this course would fitly close if it enabled them, through the architecture of their own town, to get to understand that other side of life which was neglected and of which they could understand more than they did. Architecture had been the backbone upon which other arts had clung; where architecture was great there they would almost always find the other crafts were great too; that was the reason why it had been called the mother art. They were only beginning to see again that architecture really was the language of the English people, but only when they gave to it the place it had held in the past—the highest place—and regarded it as an art and not as a domestic convenience, would they fully understand that it did express the language and thoughts of the people. In conclusion Mr. Ashbee spoke of the problem of production, observing that the workman of the past produced a better piece of work because he was happier in his work than a man of the present time. If they took a piece of work now they found it had been produced by many hands and many machines; probably there had been a strike in the shop and the workmen had not taken that happiness or interest in their work. He did not want to compare the workman of the past with the one of the present, to say that the one was better or cleverer than the other; but what he wanted to say and leave with them was that the workman of the past was a happier man than the workman of the present day, and that was proved by the work left by him. Therefore the one important thing which the English people had to consider at the present day was how they could improve and ennoble their productions.

THE ELECTRIC LIGHTING OF EDINBURGH.

THE following report on the electric lighting of Edinburgh has been prepared by Professor Kennedy:—

In accordance with the request of the electric lighting committee of the Town Council, I have made an examination of the northern half of Edinburgh with a view to the electric lighting of that district, and have made an estimate of the probable cost of the work, the probable annual expenditure, and the probable annual income from the sale of electric energy. I have pleasure in now placing on record the results at which I have arrived.

I find that the total length of roadwork in the scheduled streets is about 12,000 yards. This includes the two sides of such streets as would be likely to require current on both sides, and the whole circuits of Moray Place, Ainslie Place, Randolph Crescent and Charlotte Square. I have also included Rothesay Crescent. Of the length given, about 1,300 yards represent road crossings and other unproductive work, leaving what may be called the "productive frontage" as about 10,700 yards. The completion of the distributing mains in all the important

residential and commercial streets between Heriot Row and Princes' Street, and also the residential streets and terraces in the west to Donaldson's Hospital, in the north across the Dean Bridge, and in the east round the Calton Hill, including with these several less important streets in which connecting mains would advisably be laid, would involve about 13,960 yards of additional roadwork, of which at least 3,000 yards would be unproductive. The total roadwork for the distributing mains would therefore be 25,960 yards, and the total productive frontage about 22,660 yards. In addition there would probably be about 2,500 yards of additional roadwork for feeders, so far as they are laid unavoidably in streets where there are no distributing mains.

Keeping in view the character of the different parts of the district to be supplied—with which several years' residence in Edinburgh has made me very familiar—I have estimated that if all the shops, hotels, clubs, &c., and all the large private houses (along the streets and roads included above) were to be supplied with light, they would use from 150,000 to 200,000 lamps of 8 c.p. or their equivalent. (The difference between these figures is affected chiefly by the use of light in the premises above the shops in thoroughfares like George Street.) I need not say that it will probably be a very long time before such a large demand for current as this exists. But I estimate that in three years or thereabouts after opening the station you will probably have to supply 40,000 lamps wired. There are, of course, special reasons which make it probable that the demand for electric light will grow very quickly in Edinburgh.

I find that in London the cost of an 8 c.p. lamp per annum in an hotel or club is about 20s., in a shop about 8s. 6d., in an office about 6s. 9d., and in a private house about 5s. (these figures are reckoned on the basis of a charge of 6d. per unit). Calculating on these rates and allowing for the different classes of property in the district, I estimate your total income from 40,000 lamps of 8 c.p. at 17,100*l.*, which is practically 8s. 6d. per lamp per annum on the average. I think this is a low figure, but it is as well that you should be on the safe side.

This estimated income corresponds to a sale of 342,000 units per annum, about half as much as was sold last year from the Davies Street station of the Westminster Electric Supply Corporation, which was visited lately by some members of the Edinburgh Town Council.

Including reserve plant, there would have to be placed in the station (assuming the whole district to be served from one station) about 1,400 indicated horse-power in engines, with the corresponding boilers and electrical plant. The probable maximum demand at the lamps would be equivalent to about 6,150 amperes at 100 volts.

For your information I may say that this corresponds to a station from 15 to 20 per cent. larger than that which I am just now starting in Glasgow. The cost of it would, however, be greater in a somewhat larger population, as the mains to be laid are much longer. It is doubtful, also, if the conditions would allow so cheap a system of mains to be used as that which I have employed in Glasgow, and it is improbable that a site can be had so central as the Waterloo Street site there.

I have made a preliminary estimate of the cost of such a station as I have mentioned, and of the whole system of mains and feeders necessary for the supply of the amount of electric energy which I have given above. From this estimate I conclude that this total capital cost may be about 85,000*l.* It is probable that more careful estimates may very considerably reduce this sum; but it would be as well at this stage to assume that it is not too large. The sum I have mentioned includes buildings and chimney, plant of every description, the mains all complete, and all roadwork (in connection with this matter I have been greatly helped by a very careful detailed estimate of cost of roadwork in the scheduled streets which Mr. Cooper has been kind enough to prepare for me), and reinstatement of roads and paving. It does not include land, nor connections to customers' houses, nor meters (for these latter a rent is paid by consumers in the case of all existing electric stations).

The price I have mentioned includes a sum of 6,710*l.*, representing the additional cost of an arc lighting plant for 110 arc lamps (with duplicate machinery and an extra boiler), such as has been put up in Glasgow. This plant would be sufficient to light well the principal streets of the northern part of the city.

In my estimate I have assumed it to be essential that the system of supply should be one in which the consumers are connected directly to a low-tension network of distributing mains. The total sum I have given will be sufficient whether the network is supplied directly by low-tension feeders (220 volts) or by high-tension feeders (say 2,500 volts), with banked transformers, or on a modification of the "Oxford" system. So far as I have been able to work out the matter, there will not in your case be very much difference between the different systems in cost. But this and the other points which really determine the choice of system can only be settled after a detailed investigation.

As to cost of production, I find it possible to form an

opinion with very little difficulty. The total cost to you in salaries, wages, fuel, stores, renewals and maintenance—by the time when you are selling 300,000 units per annum (including wages and materials in maintenance of mains and all other distribution expenses)—should not be more than 2*5d.* per unit sold. Establishment charges and general office expenses should not be more than 0*5d.* per unit, making the total outgoings on works 3*d.* per unit. To this has to be added the cost of interest and sinking fund on your capital, which I do not work out, as I do not know the exact rate at which you obtain loans. If the sum borrowed were 100,000*l.*, and the total interest, &c., 3 per cent., it would amount to 2*4d.* per unit on 300,000 units per annum.

It would be possible for you to charge at the rate of 7*d.* per unit at first, and 6*d.* per unit after you had got into regular work with a paying output. So far as my opinion is concerned, however, I should certainly advise you, if you take up the work yourselves, to start boldly at 6*d.* per unit, with the object of increasing your output as rapidly as possible. You will notice that a very large part of the total cost I have given—the whole of the interest and fully half the other expenses—is really a fixed charge, and will certainly not increase until the plant has to be increased; that is, until you are selling at least 450,000 units per annum. The cost per unit therefore falls off very rapidly indeed as the total number of units becomes larger.

I may also say that the cost of doubling the capacity of your plant and feeders (the distributing mains must be made large enough to start with) will not exceed 30,000*l.*, so that the cost per unit will decrease in a geometrical ratio as the station grows.

I have left out of consideration the cost of arc lighting on both sides of the account. I assume that the current for this purpose would practically be sold at cost price. As to the time at which you can hope to make the undertaking pay, if you do the work yourselves I think you can hardly hope that you will be able to do without a loss in the first year of working. You will no doubt pay all your actual expenses apart from interest on borrowed money; but I think it would be too sanguine to hope that you would do much more. During the second year of actual working, however, if the scheme is a well-thought-out one, and thoroughly well managed, and if the financial arrangements are carefully made, I think you ought practically to clear all your expenses, including interest on capital, &c.

I need hardly point out that to attain this result—which, I feel sure, can be attained—it will be necessary, not only that the system should be well schemed and managed, but that it should be energetically pushed by the staff of the department which you put in charge of it. I feel no doubt, as I have already said personally, that electricity supply in Edinburgh should prove exceedingly profitable, owing to various local conditions (among which the price of gas cannot be forgotten), if it is thoroughly well managed.

In making these remarks I hope it will be understood that I am not expressing any opinion as to the comparative advisability of the Town Council taking up the matter for themselves or passing on their responsibilities to a company. The notes I have given are merely such as may serve, as far as they go, as part of the data on which this question will be decided. I will only urge one point very strongly, that if it be decided to hand the work over to a company it should be an absolute condition that the company should be simply a *bona fide* local supply company, entirely and altogether free from any connection whatever with any contractors, even those of the highest repute.

YORKSHIRE ARCHÆOLOGICAL SOCIETY.

A COMPANY has registered under the title of the Yorkshire Archæological Society, every member agreeing to contribute to the assets in case of liquidation a sum not exceeding 10*s.* to take over the property, effects and liabilities of the present unincorporated association known as the Yorkshire Archæological and Topographical Association, for the examination, preservation, and illustration of the history, architecture, antiquities, manners, customs, arts and traditions of the county of York, and especially the collection and preservation of books, pamphlets, manuscripts, deeds, engravings, drawings, coins, antiquities and other objects relating to or bearing upon the history, antiquities or topography of the county. The subscribers are:—G. W. Tomlinson, J.P., F.S.A., Queen's Road, Edgerton, Huddersfield, engineer; S. J. Chadwick, F.S.A., Dewsbury, solicitor; H. Lowther Clarke, M.A., The Vicarage, Dewsbury, vicar of Dewsbury and canon of Wakefield; T. L. Chadwick, M.A., Dewsbury, registrar of County Court; E. Wilson, Leeds, solicitor; H. S. Childe, Wakefield, mining engineer; J. W. Walton, Wakefield, surgeon. The affairs of the society are to be governed by a council consisting of a president, vice-president, honorary secretaries, and twenty-four ordinary members. The first president is T. Brook, F.S.A., and the first treasurer is to be H. S. Childe. Licensed by the Board of Trade.

ARCHITECTS' COMMISSIONS, BIRMINGHAM.

THE following letter from "One of the Craft" appears in the *Birmingham Daily Gazette*, and relates to distribution of commissions by the local Corporation, a subject to which we have referred before now:—

The New Technical Schools Committee are to be congratulated upon the admirable way in which they are carrying out their work in endeavouring to break down the "huge monopoly" which has existed for so long a time in the school architecture of the city. Theirs is the first building of any magnitude that has been submitted to a number of the principal architects of the city in competition.

May I whilst on the subject call your attention to the new Infectious Hospital, which, I believe, is to cost nearly 30,000*l.*? Why is this placed in the hands of the firm it is? For what reason? I was under the impression that a resolution was passed by the Council that all works exceeding 10,000*l.* should be publicly competed for, and not be given to any particular firm. Can I ask why this has not been done in this particular case?

There is also the extension to the Rubery Hill Asylum, which is estimated to cost about 25,000*l.* For what reason is this put direct into the hands of one particular firm of architects? I suppose the same analogy will apply to this as to the others, viz. that the original portion of the building was carried out by the same architects, and this matter should be placed in their hands also.

I ask where this is going to end if carried out without a limit? What opportunities will there be for the younger members of the profession to get a share of the public works of the city? I maintain, sir, it is a crying shame that there should be such a "huge monopoly" of the public works.

I would also remind the Architectural Association that they have bound themselves and formed a precedent behind which committees shield themselves. Some time back they met and passed a resolution to the effect that they thought it would be desirable to let the architect for the New Law Courts in Corporation Street carry out the new police offices at the corner of Newton Street and Corporation Street. The Association having laid down this rule, it forms a defence and a precedent for committees to act on, and will apply with equal force to other public buildings as at Rubery Hill Asylum in the new extensions. And does the same apply to the Infectious Hospital? If not, why this continued patronage to one particular firm?

If this is so, would it not be as well for the Architectural Association to rescind their resolution at once, and so clear this matter up and get justice done to the profession generally?

The Qualifications of Fellows of the Royal Institute of British Architects.

SIR,—The attention of members of the Institute is drawn to the important question to be decided at the special general meeting of the 27th inst., on the desirability of the examination of candidates for fellowship. The following *Regulation*, unanimously adopted by the Council, will be submitted to the meeting for their adoption:—

On and after November 1, 1893, every person desiring to be admitted a Fellow shall in all cases submit for examination, by and to the satisfaction of the Council, evidence of his abilities as a practising architect—such evidence to comprise working drawings and, if possible, photographs of his executed works—accompanied by a declaration signed by him that the buildings of which he has submitted drawings and photographs have been designed by himself; and such further evidence, if any, as the Council may under the circumstances of the case require.

In addition to this *Regulation* the general meeting will be asked to decide whether the time has now arrived for the Institute to make the following *Declaration*:—

Declaration of the Royal Institute under its Charter.

On and after January 1, 1896, subject to the power reserved to the Council in section 3 of the Charter, every person desiring to be admitted a Fellow shall be required to have passed such examination or examinations as may from time to time be directed by the Royal Institute.

We, the undersigned, are firmly persuaded that such a *Declaration* is undesirable in the interests of architecture and of the Institute, and is wholly unnecessary. And further, that the *Regulation* above quoted is amply sufficient to fulfil all the provisions of section 3 of the Charter, and we believe will tend

to secure a high standard of proficiency in the class of Fellows. We hope that all members who agree with these views will make it convenient to be present at the Institute on the 27th inst.—Yours faithfully,

(Signed)

JAMES BROOKS.

GENERAL.

A Memorial Chapel to the late Hon. Christopher P. Bouverie is about to be erected at the St. Martin's House of Mercy, Salisbury, to which he was for many years hon. secretary. The chapel, which is to accommodate about ninety persons, will be erected from the designs of Mr. G. Hamilton-Gordon, of the firm of Taylor & Gordon.

The Plans prepared in 1885 for the improvement of Holy Trinity Church, Guildford, by Sir A. W. Blomfield, are to be carried out at an outlay of about 5,000*l.*, that is, 2,100*l.* for work in the interior and 2,800*l.* for the tower.

M. Charles Meissonnier has decided to present eleven studies by his father to the French Government out of the collection now being exhibited in Paris.

The Painters who are to take part in the second competition for the decoration of the *salle à manger* of the Hotel de Ville, Paris, are MM. Bertrand, Lalou and Prouvé.

M. Cabat, the French landscape-painter, has died in Paris in his eighty-first year. He began to exhibit in the Salon in 1833. He was appointed director of the French School in Rome in 1878. By his death a chair becomes vacant in the Institut.

Mr. John Pettie's will has been proved by the executors, Mr. James Hardie and Mr. C. E. Johnson. The gross value of the personal estate and effects of the late Academician amounts to 11,688*l.*, and the net value to 10,497*l.*

The Exhibition to be held at Antwerp next year will be classified in 58 groups, comprising fine arts, education, liberal arts, industrial art, mineralogy, engineering, electricity, the textile industry, building, chemistry, shipping, commerce, &c.

The New Hall, measuring 150 feet by 80 feet, in connection with the Glasgow Athenæum is nearly completed. The works will cost about 30,000*l.*, and have been carried out from the designs of Messrs. John Burnet, Son & Campbell.

The Paris Municipality have decided to borrow 116,000,000 francs for works in connection with the water supply and drainage of the city.

Mr. C. H. Beloe has received instructions from the Chester Corporation to report upon a source for a water supply for the city, as the existing supply is unsatisfactory.

Mr. G. F. Watts, R.A., on Tuesday laid the foundation-stone of a lecture-hall and library, which Mr. J. Passmore Edwards is adding to the South London Fine Art Gallery, Peckham Road.

The Memorial-Stones of the new infirmary at Halifax are to be laid on June 17, when the local authorities will attend.

Mr. George Williams, on Saturday, the 18th inst., laid the foundation-stone of new Sunday schools, John Street, Bedford Row, W.C., which are being erected from the designs of Mr. F. T. W. Goldsmith, A.R.I.B.A.

M. Maillard has discovered in the course of operations on his property at Courbilhac the skeletons of several warriors that were evidently buried with care. Their metal belts and lances are so well preserved it will be possible by their aid to decide on the period when the men were buried.

Ten Associates of the Scottish Academy will be elected on Wednesday next. There are forty-seven candidates.

Mr. Alfred M. Fowler has been commissioned to prepare preliminary reports and plans for the main drainage of Brighouse and Rastrick, Yorkshire, which has become necessary in consequence of the pollution of the Aire and Calder.

Professor Schmidt has prepared a design for a new Protestant church, which will be the third in Munich.

An Association of Architects has been formed in Wellington, New Zealand, which is expected to develop into a society for the whole of the islands.

The Architect.

THE WEEK.

It is hard that those who have carried out a most difficult restoration should be called on to make sacrifices, yet that is the fate of Mr. J. O. SCOTT and Mr. THOMPSON, who have had to forego part of their claims on the committee of St. Michael's, Coventry. The debts, however, are not cleared off. A sum of 38,344*l.* was obtained through subscriptions, legacies and a mortgage on the church estate, but it was insufficient. Some of the inhabitants entered into a guarantee with the London and Midland Bank, and as that institution cannot be treated like the architect and contractor, they have become anxious about their position, more especially as their number has been reduced and they are jointly and severally responsible. All the committee can do is to implore the donors to the restoration fund to subscribe 5 per cent. on their original contributions. It has been also decided to make another effort to collect the amount of the promised subscriptions which remain unpaid.

As Ireland is at present, there is not much use in appealing for funds, however urgent and remote from politics may be the object. Owing to the state of public affairs, the committee of the proposed National Hospital for Consumption are compelled to postpone the contemplated start with the building works, as there is no likelihood of obtaining the support that would be requisite before entering into a contract for so expensive an undertaking. It is also worth noting that subscriptions amounting to 9,571*l.* have been paid, and it is therefore evident that many people feel that the hospital is a necessity. Lord FITZWILLIAM has, moreover, presented a most suitable site in the county Wicklow, and which has an area of about nineteen acres. The plans which were prepared by Messrs. T. N. DEANE & SON are also approved, and all that is needed is money, which unhappily is not likely to be provided while the country is in an agitated and apprehensive condition.

An exhaustive essay on the history of sculpture in wax was read at the meeting of the Académie des Beaux-Arts, on last Friday, by M. GASTON LE BRETON, the director of the Musée de Rouen. One point which excites much interest at the present time in France was brought out clearly. M. LE BRETON was able to show, on the evidence of a record discovered by M. MASPERO, that as far back as the reign of RAMESES III. lovers of the black art used to make wax figures of the men and women they were eager to overcome, and recite incantations over them. His Majesty was not exempted from being made a subject, but whether he suffered from the powers of darkness is not revealed by any painting or sculpture. It is fortunate for us in England that we are indifferent to portrait models in all forms, for if some French connoisseurs are to be credited, it is easier now than at any previous time by the aid of a figure in wax (that need not necessarily be a work of high art) and a little gibberish to employ spells and wreak such vengeance as the witch in "Macbeth" contemplated.

ON Easter Monday the preparations for the removal of MEISSONIER'S works to London for exhibition will commence. It is to be hoped that not only the pictures and studies which the artist possessed but a large proportion of those which were lent for the exhibition in Paris will accompany them. In London there is little doubt the exhibition of MEISSONIER'S works will excite almost as much interest as in Paris. It is understood that all the money received for admission to the exhibition, which will close in a few days, will be handed over to the charities which the artist aided, for M. CHARLES MEISSONIER has decided to defray the expenses.

MASON COLLEGE, in Birmingham, it is supposed was founded to advance technical education, and especially those branches which have most interest for local manu-

facturers. Whether the scope of instruction has been widened and the expenses increased in proportion, or the funds available are insufficient, there can be no doubt that the college is not what it ought to be. The Principal says that a great deal remains to be done in some technical departments, particularly in engineering and electrical engineering, before in equipment the college can be compared with others of similar standing. A large manufacturing centre like Birmingham ought not to be so limited in respect of facilities for the higher technical and professional training. Hitherto, expenditure on equipment does not exceed a mere fraction of what has been spent in many English towns for the like purpose. The most pressing need in the engineering department is a large testing machine. The purchase of such a machine has been under the consideration of the Council many times, but they have not seen their way to expend so much money as would be required. The delay is undoubtedly hindering the growth of the department. Another technical department of great industrial importance is languishing for want of money. There are this year only two students in the electro-technical department, and of these one is merely repeating the course he took last year; so that there is only one new entry. This seems very strong evidence that the work is not on right lines, and that it ought to be placed in the charge of a specialist with adequate equipment. At present the college cannot even compete with the technical schools. The truth really is that the Birmingham Corporation have to struggle in earnest for the existence of trade which was imperilled by the worthlessness of the State system of instruction in art and science. The technical schools have therefore secured the standing which the Mason College might have held under other conditions. Students prefer the schools to the college on account of the cheapness and efficiency of the instruction. Mason College may become a useful place for training school-mistresses, or it may even be transformed into a sort of medical school; but whatever may be its fate, it appears to be drifting away from the founder's idea.

WE have recently seen a very beautiful series of platinum prints of ten of the principal historical buildings in England. They are executed by Mr. F. W. EDWARDS, the well-known architectural photographer, and are published by Messrs. MARION & Co., of 22 and 23 Soho Square, London, W. The plates are mounted on heavy plate-marked India tint mounts, forming a picture 32 inches by 26 inches, and are issued at the remarkably low price of a guinea. The process by which they are produced is absolutely unchangeable, so that the print remains permanent for all time. They are produced in a delicate sepia tone, which gives a fine effect to the ancient masonry. We have not seen an engraving or etching which, for beauty of effect or truthfulness of rendering, will surpass these platinotypes.

A SECOND edition has been brought out of the lecture on "The Theory of Storiation in Applied Art" which Mr. HUGH STANNUS delivered at the Society of Arts in January. It relates to "that section of the rules of applied art which governs the selection and representation of meaning in the decoration of objects." An immense amount of material has been subjected to examination, and the lecture will not only impart new interest to the study of decoration, but will also aid students in the acquisition of a rational system of setting out their ideas. Mr. STANNUS has not spared labour in elaborating his theory, and in the present form his lecture will, we trust, be found useful to many artists, students and amateurs.

WE have already noticed the useful, if tiny, "Pocket Glossary of Technical Terms," published by Messrs. CROSBY LOCKWOOD & SON. A second edition has appeared, which comprises additional tables and other information. A book that can be carried in a vest pocket is no slight advantage for all who have to employ French technical works or to convert French weights and measures into their English equivalents.

THE STEAM-ENGINE.*

IT is not necessary to discuss the advantages of the steam-engine at length. In 1819, when it might be said to have scarcely emerged from its cradle, FRANCIS JEFFREY was able to say, "It was our improved steam-engine that fought the battles of Europe, and exalted and sustained, through the late tremendous contest, the political greatness of our land. It is the same great power which now enables us to pay the interest of our debt, and to maintain the arduous struggle in which we are still engaged, with the skill and capital of countries less oppressed with taxation." It was natural at the time that the influence of the steam-engine as a sort of indirect but invisible sinew of war should be foremost in men's minds, but JEFFREY could also recognise some of its other advantages. So he said, "It has armed the feeble hand of man with a power to which no limits can be assigned; completed the dominion of mind over the most refractory qualities of matter, and laid a sure foundation for all those future miracles of mechanical power which are to aid and reward the labour of after generations. The blessing is not only universal but unbounded; and the fabled inventors of the plough and the loom, who were deified by the erring gratitude of their rude contemporaries, conferred less important benefits on mankind than the inventor of our present steam-engine." There is little doubt that what seemed only visionary to JEFFREY (and it may be to his friend JAMES WATT) has been more than realised. The steam-engine is now a very direct agent in war, for it brings combatants together with an expedition that has created a new system of strategy. As regards industry, every year the number of callings which can afford to dispense with the aid of steam power is diminishing in England. Building, which was believed to be as dependent on handicrafts as in the primitive days, has ceased to be peculiar. Thanks to the inventiveness of TANGYES, ROBEY, RANSOME, HICKS, MATHERS, BAILEY, CRAVEN and others, engines are obtainable which, if moderate in price and of limited dimensions, are efficient, and can be turned to a variety of uses. Steam-pumps remove many of the difficulties which surrounded work in foundations. Steam-cranes and gantries have enabled work to be executed with expedition in positions that are lofty. In the quarry the steam engine has become necessary, and it enables stone to be cut not only into blocks but into veneers. The brick-maker has his steam-power brick-press, clay-grinders, &c. Timber is sawn, planed, surfaced, moulded and adapted to a variety of uses by means of power that is derived from steam-engines; metals have also succumbed to steam, and have become as convertible as wood. If in modern buildings it became necessary to prohibit the use of materials and articles which in any way were affected by the employment of steam-power, the order could not be accomplished unless at a cost that would amaze people.

The steam-engine was sufficiently efficient in WATT's time to justify his partner when he told GEORGE III. that they sold what kings were fond of—that is, power—at the Soho Works. An engine that was "stupendous alike for its force and its flexibility, for the prodigious power which it could exert, and the ease, precision and ductility with which that power could be varied, distributed and applied," might be supposed to be as perfect as was needed. At the close of the eighteenth century General BENTHAM was able to devise wood-working machines which, with no other motive power than was given by one of WATT's primitive engines, was able to be used for planing, rebating, mortising, the production of winding and curved surfaces, and even a sash window was turned out. Since that time many hundreds of improvements have been effected in the steam-engine, yet no expert would say that it is perfect. Judging by the past we assume that a century hence patents will still continue to be taken out by engineers for "improvements in steam-engines," and there will still be opportunities remaining to tax the ingenuity of inventive men. What is of more importance is that every improvement in the engine inspires improvements in the machinery which it sets in motion.

* *The Steam-Engine: A Treatise on Steam-Engines and Boilers.* By Daniel Kinnear Clark, M.Inst.C.E., M.I.M.E. In Two Volumes. Blackie & Son, Limited.

The large work which Mr. D. K. CLARK has prepared exhibits the efforts made in our own time to increase the efficiency of that machine which WATT claimed to have improved rather than invented. It cannot be called historical, and that is one of its most satisfactory characteristics. People who are of an archaeological turn can find interest in the old engines which are in museums, but a practical man would not think of setting about the improvement of any but the very latest class. He has to start with present times and present objects, and to leave the past and its engines to take care of themselves. Unless he is up to date like the newspapers an inventor has not much chance of being useful to his generation, and men of this class do not look to posterity for compensation for the indifference of contemporaries. For inventors and all who desire to be acquainted with the most advanced types of steam-engines there is no work that is comparable with Mr. D. K. CLARK'S. That he spares no pains to be exact is known to everybody who is acquainted with his writings, which have all gained acceptance as authoritative; but we doubt if Mr. CLARK had previously undertaken so exhaustive an investigation as was necessary before his two massive volumes could be produced. It was not sufficient to describe an immense number of British and foreign inventions which in some way were connected with his subject; Mr. CLARK had to systematise them and to explain their relation to one another. To a man who was not skilled in composition and resolute in keeping a fixed object in view a similar venture would end surely in chaos.

As the object of improvements is to increase to the utmost the amount of power that is to be derived from fuel, Mr. D. K. CLARK properly begins with a consideration of heat and water, which become in their combined form the life of an engine. He gives an account of experiments on all known fuels that might be employed, and, as in treating other subjects, summarises, as far as possible, the results in tables. Petroleum oils are found to afford the largest amount of heat, 1 lb. giving a total heat of 27,531 units, while average coal gives 14,700. Coal has, of course, compensating advantages, and many pages are assigned to the experiments upon it, for it is never likely to be superseded as long as steam-engines are employed. But, with coal especially, the problem becomes how to insure, as CARLYLE expresses it, "a purifying fire, wherein all poison is burnt up, and of sour smoke itself there is made bright, blessed flame." All that has been attempted for the prevention of smoke from the domestic fireplace is insignificant if compared with the efforts to rescue furnaces of steam-boilers from it. Mr. CLARK has tried to get over the difficulty, but when he superintended the series of official tests in connection with the Smoke Abatement Exhibition he did full justice to every effort.

The trials of furnaces and boilers are next discussed. From them formulæ have been deduced for proportions of heating surface, grate area, &c., of the various sorts of boilers of stationary, locomotive and marine engines. Then an account is given of the latest inventions for mechanical stoking, and from the experiments it becomes evident that with some of them there is a larger evaporation of feed-water than with hand-firing. In his chapter on factory chimneys, Mr. CLARK is no less precise. The necessity of adequate height is suggested by the remark of an American observer, who found that "in a still atmosphere the column of hot gases may rise unbroken to a level considerably higher than the top of the chimney, and that inasmuch the force of the draught may be augmented." A couple of extracts from Mr. CLARK's chapter will suggest that if there be empiricism about the proportions of factory chimneys, it is of a kind that can be made to assume a correspondence with theoretical form:—

Factory chimneys in Lancashire are made with liberal proportions. For the service of a range of six Lancashire boilers, 7 feet in diameter and 30 feet long, having each of them 33 square feet of fire-grate, Mr. Daniel Adamson provides a round chimney 150 feet high, 11 feet in diameter at the base and 6½ feet at the top. The total area of fire-grate is (33 × 6 =) 198 square feet, and that of the chimney-top is 33.18 square feet, of which there are 24.1 square inches per square foot of grate. The quantity of coal consumed, at the rate of, say, 17 pounds per square foot of grate per hour, is (17 × 198 =) 3,366 pounds per hour; and for the consumption of this there is a provision of 1.43 square inches of top-area of chimney per pound of fuel. Assuming the temperature 600 deg. F. for the escaping gases, the upward velocity at the top of the chimney would be 100 feet per second.

The volume of gases discharged is 570 cubic feet per second, for which a chimney area of $(570 \div 100 =) 5.70$ square feet would be required, being at the rate of .24 square inch per pound of coal consumed per hour. This calculated area is only one-sixth of the area actually allowed.

According to Lancashire practice, a chimney 60 feet high and 4 feet square at the top may be built for the service of six boilers, each evaporating 50 cubic feet of water per hour. Allowing 8 pounds of coal per cubic foot of water evaporated, 400 pounds of coal would be consumed per hour for each boiler, or 2,400 pounds per hour for six boilers. The top area of the chimney is $(4 \times 4 =) 16$ square feet or 2,304 square inches, or at the rate of $(2,304 \div 2,400 \text{ lbs.} =)$ say, .96 square inch per pound of coal consumed per hour. Allowing 35 square feet of fire-grate per boiler, there is a total grate-area of $(35 \times 6 =) 210$ square feet, for which the top area of chimney is at the rate of 11.45 square inches per square foot, and the coal is burned off at the rate of 11.5 pounds per square foot of grate per hour.

For a single boiler of the same dimensions and performance, a chimney 60 feet high, 2 feet square at the top, may be built. Here there is a top area of 4 square feet or 576 square inches, at the rate of 16.5 square inches per square foot of fire-grate. Coal is consumed at the rate of 11.5 pounds per square foot of grate per hour and 1.44 square inches of top area of chimney per pound of coal per hour is provided.

For an engine of 50 nominal horse-power consuming, say, 800 pounds of coal per hour, a chimney 60 feet high and 4 feet in diameter at the top may be built. At the rate of 15 pounds of coal per square foot of grate, the area of fire-grate is $(800 \div 15 =)$, say, 54 square feet. The chimney area is at the rate of 33.5 square inches per square foot of grate and 2.01 square inches per pound of coal.

Mr. Box mentions a chimney at Dartford which works well. It is a round chimney 80 feet high and 2 feet 9 inches in diameter at the top. It burns off 10 cwt. of coal per hour, for which the area is equivalent to .76 square inch per pound of fuel per hour.

In his second section the author treats of "the principles and performance of steam-engines," that is, regarding them under general aspects. Then follow chapters on details such as boilers, slide-valves, gearing, governors, &c. The different classes of engines are described in succession, such as stationary engines for general purposes, for large mills, pumping-engines, special engines, portable engines, multiple-compound or multiple-expansion engines, railway locomotives, compound locomotives, tramway locomotives, marine engines, &c. The illustrations are numerous, exceeding a thousand altogether, and are reduced from excellent mechanical drawings.

The publishers evidently prefer to invest in works that will have enduring interest, and Mr. D. K. CLARK'S "Steam-Engine" is the most important of those which treat of practical subjects. It is creditable to the firm to bring out such costly volumes, which, however, are offered at a price that is most moderate considering the quality of the information that is found in the pages.

MR. HERKOMER'S AUTOBIOGRAPHY.

ON Tuesday Mr. Hubert Herkomer, R.A., delivered his address as president of the Birmingham Royal Society of Artists. According to the *Birmingham Daily Post*, he said that in looking back he clearly saw that his artistic development had hardly a steady basis. The want of a strong, yet judicious, hand to direct him, that could have seen the drift and the identity in the embryonic state of his work was plainly visible. He did know himself now, but it had taken him twenty years to learn to do so. Very early his heart longed for the master's hand, and thus it was that he vowed that when the time came and he succeeded he would extend his practical hand to those who needed it, and save them from the many pitfalls he had encountered. He was saved by a "craze," but it was a wholesome craze. It was the "Walker craze." Curiously enough, before this craze settled upon him his longings hung in the balance between Walker and John Pettie. This splendid painter, whose loss the art world could not deplore too deeply, was at that time quite a "force" among young painters, though at that time he did not know it. He traced Pettie's influence upon him to a picture called *The Arrest of a Witch*. It was so brilliantly and vigorously treated and the open daylight in the picture so enchanted him, that, standing in front of it in the Academy, he well remembered remarking to his father, "I wish I could paint an oil picture to look like that." But by a strange process of natural gravitation he dropped bodily on to Walker. The Walker craze became a factor, a faith, a director to him. It became the all-powerful sight and seeing. But the seeing was long held back by wrong sight, for he took the outside qualities so often for the inner drift and meaning. He did not really understand the school until he came into close contact with Mr. J. W. North, who was undoubtedly the creator of the "germ" of that particular style which we call the Walker school. They might be surprised to hear that this did not

happen to him until the spring of last year. The result had been to bring back all the fervour of his early youth for a certain direction, and that without loss of intensity. But he was steadier and more wary, as a veteran who had gone through many dangers should be. That this early love should have sprung up so strongly in him as soon as he came in contact with the spirit that first gave it life was the more remarkable as he had in the intermediate time passed through a strongly-marked phase in his oil-colour portrait-painting which had never been touched by his leaning to the Walker school. Even now, when it was a question of an oil portrait, he was a distinct person, influenced by nothing but the personality of his sitter. But for that blessed power which had been left him to divide himself, as it were, into two individualities, he could not be sufficiently thankful. It widened his life immeasurably; it broadened his sympathies. It lessened the pain of failure; it increased the joy of success. It deepened the meaning of nature to him, and it kept alive the sensitiveness to fresh impressions without any risk to the fidelity of the heart. He could not determine now whether the "form" of his first work was likely to lead him to the best art he was capable of in after years. But he did know that it was a safer school to follow than the most modern of schools, which sought to startle by mere manipulation, which threw drawing to the winds and sentiment and modesty to the dogs. The whole school, however, to which he belonged emerged from the ranks of wood-draftsmen, and one and all suffered from some of the penalties which that peculiar work inflicts upon the man whose ultimate desire it is to become a painter. Drawing remains the all-essential element at first, and colour is but nominal. Overdrawing always destroys the charm of colour. Men like Turner have loosened up in their drawing as they have approached the golden period of their colour age. Walker, when he came into close contact with North, brought his ripened colour-faculty to bear upon his drawing with singular felicity, seldom approached by any other painter except Millais in our times. But in these early works of his (Mr. Herkomer's) subject was always a first consideration—aye, and never without a touch of sentiment either—then composition and drawing. There would be found in them an earnestness which he was not a little proud of pointing out. And if that earnestness sometimes overlooked what we now termed beauty, there was never to be found an inane figure, or a galvanised figure, or the slightest tendency towards instantaneous photography. One did not go about in those days with a hand camera. The demon was not yet abroad. The flattened-out figures, all grey and silhouette, were views of nature unknown to one, because the mechanical device of showing this form of drawing had not been invented, and no living man could have seen nature in that way without it. He desired to say one thing else in gratitude. Whatever faults were to be found in those early works, they were in type, in sentiment, and manipulation thoroughly English. Yet he was not an Englishman by blood, which made it all the more singular. And although he broke from English ground afterwards, and painted so much in his native Alps, he was only thoroughly happy in an English subject—indeed, a more thoroughly English subject had probably not been painted during the century than the *Chelsea Pensioners*. Although he understood the Alpine peasant to the core—could talk with him in his own dialect—the view he painted of his life could not be found in any of the Continental pictures by German painters, born and bred. Why was that? Because he had learnt, through the "Walker craze," to believe that sentiment and pathos belong to the peasant, and he was determined to carry out this doctrine in his native mountains. But all this, continued the President, has changed. We go to Paris now. The "over-appreciativeness," as Hardy calls it, of this age causes small things to be magnified. We wonder at insignificant things just now. Anything that makes us "sit up" is magnificent. Anything that frightens us must be wonderful. Anything that makes us laugh must be full of wit. This in art, in music and in literature. But a sound core remains in this splendid nation that cannot readily be corrupted; therefore he had no fear that the newest craze will damage the permanent art of England. Dealing in greater detail with the story of his variety of styles, Mr. Herkomer was able to illustrate it by pointing to some of his pictures which adorn the walls of the gallery. In the most generous and sympathetically appreciative notice of his work which appeared in Monday's *Daily Post*, the writer had, he said, exactly named the weaknesses of the picture, *After the Toil of the Day*. They were the result of youthful fervour in certain directions. With the assistance of his dear father he had made absorbent grounds to work on that sucked the very life out of the oil-colour. Both *After the Toil of the Day* and the *Last Muster* were painted on the mere canvas, sized, without a bit of oil ground underneath. The story of how the latter came to be painted demands a verbatim reproduction. "A terrible journey from the Alps with an invalid member of my family," said the painter, "a journey that took three weeks to accomplish, left enough courage in me

to tackle a subject that one and all of my best friends and advisers said was an impossible one. The mass of red coats was unpaintable, the background uninteresting; and above all, who would care for a lot of old men? I did not argue with them, but set my teeth, knowing within my heart that I could make something of it. One year's absence from the Academy Exhibition had already troubled me, and I felt that a gigantic effort had to be made to send in a telling picture the following year if I intended to carry forward the good impression already made by my first picture in the Academy. I still retained the little glasshouse and studio in Chelsea, and I determined to do the picture there, although I was already living with my family in a cottage at Bushey. But it was not until after Christmas of the same year, 1874, that I could commence this work. Then came the trial. The strain of the work was enough, but there was more for me to suffer, for when I returned exhausted from town I was surrounded by sorrow in my home that seemed endless. Still I worked—worked as if for dear life. It was ambition, perhaps, that spurred me on, but it was ambition in a worthy cause. Suddenly, when about half-way through the work, nature refused to support the spirit and my health broke down. A week or two was lost in getting back sufficient strength to continue. On again, no time to reflect as to the possibility of a failure; only on, on, to finish it in time. At last the dawn of its completion came, and well within the time of sending it to the Academy. Now my spirit broke down, and I wept over the picture—wept because it was so unlike a Walker. I said to myself, "How could the Academy accept a picture that was so unlike anything that I had ever seen?" And oh! the bitterness of the suspense! Before the week was out, however, the post brought me two letters from two members of the Council—one from Sir Frederick (then Mr.) Leighton, and the other from Mr. George Richmond—expressing the admiration the Council felt for my picture. Mr. Richmond went so far as to say that they showed their appreciation when the picture came before them by clapping hands. Then I wept again, for indeed "my heart was full of tears." The picture caused a burst of appreciation that seldom comes to painters for a single work. Wherever it has been seen it has met with the same success. And now it has gone to Chicago, and we will see what the American nation, with its ingrained prejudice against English art, will have to say to it. After that there was considerable prospecting for new ground, partly to secure freedom, and partly to remove the chances of comparison. He evaded the danger of coming under the tyranny of the masses, so that now the public was not surprised at any new turn he might choose to take in the development of his career. That was a merciful condition, for he felt as much at the beginning of art now as he did twenty years ago, and he hoped still to develop the phase of art that first came to him in those early days. The first link in the chain which is to connect the two periods they would find, he said, in the water-colour drawing he painted last summer, called *The Modern Hagar*. He was very happy about that picture, and he had given it to his wife so that it should not be sold. That it had been done under the influence of J. W. North they would see at a glance, and on the method and beauty of this remarkable painter's work Mr. Herkomer proceeded to an intensely interesting criticism. "I hold it," he said, in approaching his conclusion, "to be the safeguard of an artistic life to follow the fancies of each period, both as to subjects and methods of treatment. Let the artist go through his realistic, his mystic, his sensational or his academical periods. Each has its pivot of action in the brain, and characteristic work will be forthcoming if free play is given to it. Thwart it, and ten to one your work is mechanical and commonplace." Finally, "I dream yet," he said, "of work to be done, great work, work worthy the name of artist; and I pray for life to accomplish my best work in the future. That success has been and is sweet to me it would be affectation to deny; but sweeter than all to me is the feeling that I am still a student."

The President was loudly applauded at the end of his address, as he had often been in the course of its delivery.

TESSERÆ.

Glass Painting in the Sixteenth Century.

AFTER the Reformation in England we may trace a new era of stained-glass, which may be said to have commenced with the seventeenth century. The prejudices of the first reformers having relaxed in certain points relative to the internal decoration of churches, the introduction of so splendid a mass of ornament and of one so congenial with the architecture still remaining, was no longer proscribed by a positive injunction. Our commercial intercourse with the Low Countries, where the arts had begun to flourish and where a school of painting had been established, facilitated the acquirement of stained-glass, which emerging from its former rudeness now exhibited a certain regularity of design. During the reigns of

Elizabeth and James I., armorial bearings and small portraits in circles were the usual decoration of the bay windows in the great manorial halls; but complete scriptural histories, in which the figures were well designed and grouped, were rarely seen excepting in the private chapels in the houses of nobility. James Nicholson was much employed as a glass-stainer in the sixteenth century, and Mark Willems, who died in 1561, is recorded in Walpole's "Anecdotes" as supplying the glass-stainers and arras-makers of that time with designs for their several works. Of that age are windows at Lullingstone in Kent, of the stories of St. Botolph and St. Amphibalus, set up by Sir Percival Hart, knight; the subject of the Crucifixion at Greenwich, in Norfolk College chapel, and portraits of the Tudor family at Battersea Church. The age of Elizabeth and James I. was by no means unfavourable to the art of staining glass. Archbishops Abbot and Laud were liberal encouragers of it. The former had embellished the parish church of Croydon, in Surrey, with many windows of stained-glass, and in the time of the Rebellion there is an account of a man's having been paid half a crown a day for breaking them. He was probably in no hurry to complete their demolition. Many windows are said to have been buried in order to preserve them, which when taken up again were replaced without judgment. About the middle of the reign of James I. Bernard Van Linge, a Fleming, is supposed to have settled in England, but was at all events the father of glass painting in its renewed and improved state in this kingdom. Walpole remarks that the popular notion that the art was totally lost to us was founded in ignorance of the fact; it was indeed dormant, but never extinct, for there is no great interruption in the chain of its chronological history to the present day. As the art was frequently practised by particular families in succession certain recipes may have been confined to them.

Opie and Reynolds.

The portraits by Opie present always a masculine severity of style, in perfect unison with his own general character as a man; not the severity of a distempered and harsh disposition, but of a mind, bold, vigorous and persevering—a contemner of the trifling and ephemeral passions. The innate quality of his mind was highly gifted with the feeling for historical and scriptural subjects, and had the taste of the country tended that way at the time and had his own life been prolonged, it is not too much to presume that an historical school would by this time have been established in England, worthy of comparison with any of the illustrious schools of the Continent. He possessed every requisite to carry such a plan farther than any preceding painter in this country. His lectures partake of the same powerful qualities as his paintings—a native boldness and vigour, finely tempered by habits of acute observation and deep reflection. Without partaking of the polish and elegance of Reynolds or of the classical erudition of Fuseli, yet in fervid eloquence of thought, in truth of observation and in fine critical acumen he is not inferior to the former, and is more practical and instructive than the latter, without also possessing one tincture of the gratuitous irony and irritability of Barry. The painting of Opie, more particularly that of his portraits, although executed in a style bold and broad, yet it does not carry the appearance of colour observable in Reynolds's productions. Opie's touch is decided, and all his paintings seem as though each piece had been painted at once. Sir Joshua's, on the contrary, although worked with great power and decision, always bear the evidence of intense labour and application. Much of this difference must be ascribed to the difference of intellectuality between those two distinguished persons. Opie is matter of fact in everything and never ideal; we never perceive poetical elevation of character, nor refined expression of sentiment, beyond what is actually before him: whereas Reynolds, at the same time that he portrayed the identical individual with every striking peculiarity of character, also infused into the portrait an elevated and ennobling expression of sentiment. This was a power which, in the language of Fuseli, "substantiated humour in Sterne, and mental and physical strength in Samuel Johnson." The mind of Reynolds was of a poetical nature; it was fanciful and imaginative, and consequently in every painting he sought to distinguish the preconceptions of all that is beautiful in colour, light and shade, from expression and drawing, by a prudent and discriminating selection from the varied excellences of his illustrious predecessors. No portrait-painter but Reynolds appears to have manifested so fixed an object to impart to his portraits the majesty and expression of Michel Angelo, the tenderness of Raphael, the elegant and graceful line of Domenichino, the nobleness of Vandyke, the colour of Rubens and the chiaroscuro of Rembrandt.

William Dobson.

Walking one day along Snow Hill, Sir Anthony Vandyke, then a successful painter making a large income, caught sight of a picture in a shop window, and stopped to look at it. It was worth a second look, nay, it was worth the trouble of going into the shop and asking the name and address of the artist.

Having found these out, Sir Anthony, with a love of adventure, determined to visit the painter. He went to the address given, mounted flight after flight of steps in an old house, in a poor neighbourhood, and in an ill-furnished room found a starving painter behind his easel. The handsome face, with long aquiline features, and the look of care in the large dark eyes made their impression on the successful Court painter. His generous heart felt for a fellow artist in distress, and he offered him the hand of fellowship. The obscure painter was William Dobson, the son of a poor gentleman of good rank at St. Albans, who, to gain his bread, had been bound apprentice to Robert Peake, a picture-seller near Holborn Bridge. Peake was a bad artist, but a good royalist, and in after years wielded his sword with better success than his pencil, fought for the king, defended and was taken prisoner at Basing House, and was knighted at Oxford in 1645. Dobson was born in Holborn in 1610, and from Peake he learned the rudiments of painting, and is said to have studied later under Francis Cleyn. But though he gained little by the instruction of the loyal picture-dealer, he learned in his shop the works, if not the words, of great masters, and the grandeur of Titian and the elegance of Vandyke taught their copyist the best parts of their art. Sir Anthony found him worthy of his generosity, took him from his wretched lodging and supplied him with the necessities to pursue his occupation in peace. He afterwards introduced him to Charles, and Dobson was made. On the death of Vandyke he was appointed serjeant-painter and in 1642 accompanied the king to Oxford, where Charles and Prince Rupert sat to him. The young artist had already achieved his reputation as a portrait-painter and was almost as great a favourite as Vandyke. But Dobson, like his friend, was extravagant, and ere long Charles was too embarrassed to help him. He fell into debt and was thrown into prison, from which he was released only to die, in 1646, at the early age of thirty-six. Had he lived longer and studied under a good master, still more, had he visited Italy, as Rubens and Vandyke had, there is little doubt that William Dobson might have taken his place by the side of those masters. As it is he is the best painter that England produced before Hogarth. He painted chiefly portraits, but his taste for historical subjects is shown in the manner in which he grouped his sitters.

Varieties of Gothic.

The differences in style in old buildings is very great, and the result of various causes. It is to be observed, first of all, that though Mediæval art is in one sense entirely harmonious in all parts of Europe, it is generally true that it is subdivided endlessly by little distinctions of district, province, or country, which serve practically to create endless varieties of style or detail, all in progress at the same time. It has been very much the custom to assume that these local varieties indicate divergences of principle, so that it is not safe for one man to study more than one of them. This is simple nonsense, for it may much more truly be said that no one does understand Gothic art who has not studied that of more than one country; and it is most undoubtedly true that there is as much difference in the style of old buildings in the various countries, districts, or provinces of one country as there is between any one of these and some variety of the work of another country.

Patronage of Art by Charles I.

It is to the honour of Charles that he took the greatest pains, and expended the largest sums, in inducing foreign masters of celebrity to visit and even settle in this country; and as a patron no less than as a collector, his name stands out pre-eminently among our sovereigns. He was not only the first, but also the last of them who valued art for its own sake, and he appears to have been the only English king who could thoroughly appreciate it. It is from this cause that the names which adorn his reign are more in number and greater in renown than those of his predecessors and successors alike. Henry VIII. had employed Mabuse and induced Holbein to settle in London; Elizabeth sat in fantastic dresses to Federigo Zuccherò; James patronised Cornelius Jansen, an imitator, if not a rival, of Vandyke, and the portrait-painter Van Somer. On the other hand, the languid mannerism and luxurious draperies of Sir Peter Lely found favour with Charles II., who paid a salary to William Vandervelde and bought the perfect sea-pieces of his yet more celebrated son; Kneller was the chief ornament of William's reign, and Jan Wyk fought the battle of the Boyne on canvas for him. When we add that under the first of the Brunswicks Watteau struggled for one year in London, Vander Myn lived sumptuously and died in poverty, while Denner brought hither one of the productions of his marvellous industry, we are ready to compare the celebrity of these names with that of the artists who were associated with Charles I. The historical and portrait-painters whom he gathered around him were Rubens, Vandyke, Gerard Honthorst, Gentileschi, Hanneman and our own Dobson. For portraits alone there were Beck, Mytens (Daniel not the better known Martin), Artemisia Gentileschi, John Hoskins and Nicholas Lanier. Poelmburg and Wouters painted landscape for him, the younger Steenwyck architecture, Gerbier

miniature, and the dissolute Torrentius drinking cups and still life. Nor were the kindred arts unrepresented. The best architect England has produced since the Reformation built for his palace one of the greatest ornaments of the metropolis to this day, little thinking that the scaffolding he then used would, in after years, be replaced by one prepared for his master's death-block. The statue of Charles at Charing Cross is very fair evidence of the talent he patronised in that branch of imitative art. Hubert le Sueur, who designed and cast it, was a Frenchman, who appears to have settled in England and produced many works, of which, however, this statue and one of William, Earl of Pembroke, at Oxford, are said to be the only two that remain.

The Church of St. Gommaire, Lier.

The town of Lier is reached by the Antwerp and Turnhout Railway. It possesses a great cross church of cathedral size, with chapels round the choir, western tower and central spire. It is for the most part transitional from Middle-Pointed to Flamboyant; and, except perhaps in Mechlin Cathedral, there is no building in Belgium to surpass it in the beauty of its details. The apse recalls that of Amiens; its five arches, stilted, and with the finest mouldings, its five two-light windows and stained-glass are altogether very noble. The choir has three bays, the transitional clerestory windows are of six lights, with grand tracery, and the balustrade in the triforium is elaborately worked. The seven eastern chapels are of later date and less remarkable. The chancel aisles are of much the same character with those in the nave. The transepts are enormously high, and have the peculiarity of a projecting nine-sided apsidal chapel at the east. The great window in the north transept of eight lights, in two divisions, is Flamboyant, but with an almost ultra-Perpendicular effect, the central mullion running up to and bisecting the apex of the arch. The three west clerestory windows of this transept are very early Flamboyant, of six lights, and of the most magnificent work. The great window of the south transept, also of eight lights, may be fairly called Middle-Pointed, except that the wheel in the head has some tendency to Flamboyant. The rood-loft is the finest in Belgium. It projects west, has three arches facing due west, and one on each side obliquely facing north-west and south-west. Above these arches is a series of panels containing scenes from the Passion, beginning at the Betrayal and ending at the Crucifixion, three over each arch; but in the centre, above the entrance, is a kind of projecting pinnacle, carrying the image of St. Gommaire, the patron saint of the church, and having in niches below two of his miracles. The piers of the arches are of black polished marble. Nothing can be more exquisite than the whole design and details of this rood-loft. The nave has six bays, besides the tower; the piers are simple, circular, with octagonal capital and double octagonal base. The clerestory is of five lights and exceedingly rich; hardly any one of the windows throughout the church has been, as is so universally the case in Belgium, gutted. The aisle-windows are a mine of transitional enrichments; the south aisle, indeed, can scarcely be said to go beyond the bounds of late Middle-Pointed. There are eight windows of five lights (except the eighth, which has only three); the tracery of almost all is different; nothing can be more varied and beautiful. The tower, which is not equal to the rest of the church, is square to the height of the nave roof, then octagonal, and capped with a most vile cupola. The western porch has three exquisitely beautiful niches over its inner door, and its sides are arcaded in late Middle-Pointed work. On the whole, this church is far better worth a visit than many of those in Bruges or Ghent, which everyone goes to see.

The Kremlin, Moscow.

All the most remarkable buildings of the Kremlin were erected during the reign of Ivan III. or that of his successor, Vassili. The walls and towers of that enclosure were constructed by two Italians, Marco and Pietro Antonio, between the years 1485 and 1492. The banquetting-chamber which subsists at present, as described by Jenkinson in 1557, "A fair great hall, in the midst whereof is a pillar, four square, very artificially made," was begun by Marco in 1487 and finished in 1491 by Pietro Antonio. The Palace of the Czars is the work of a Milanese named Alevisio, who began it in 1499 and finished it in 1508. The church of St. Michael was completed by the same architect in 1507. But the buildings of the Kremlin must not be considered in detail. Mean and insignificant as many of them are if minutely and separately examined, the effect of the whole when seen from almost any point of view is, beyond conception, stately and picturesque. The strange and brilliant summits of so large an assemblage of churches, the contrast of bright colours with which many of them are painted, the curious architecture of the mural and other towers, and above all the Palace of the Czars, with its terraces, balconies, flights of steps and remarkable roof unite to form a picture of more than ordinary richness and pomp, to which, indeed, all Europe cannot furnish a parallel, except, perhaps, on the shores of the

Bosphorus. It will not be forgotten that this striking group of buildings, after having escaped destruction by fire during the great conflagrations which ravaged Moscow in 1547, in 1571 and on the arrival of the French in 1812 was mined in two places by those insatiate marauders on the eve of their memorable retreat. Fortunately, no object of primary interest has suffered irreparable injury from the effects of this wanton explosion, for which the obsolete military character of the Kremlin may have furnished a miserable pretext, but of which the real motives are nowhere to be found but in the mischievous malignity of disappointment.

Archæology and Art.

It is curious to observe how important a place archæology occupies and must occupy in modern art. There have been times when such a thing as "keeping" was unknown, and the most incongruous anachronism shocked no one. No Mediæval architect, for example, ever dreamed of reviving or perpetuating a defunct style; and the earlier artists clothed their Holy Families or saintly groups in the habits of their own period. Garrick saw nothing absurd in acting Julius Cæsar in a full-bottomed wig; and, except for the ill-omened precedent of the revival of the costume of Brutus at Paris in the days of the Terror, it has been left for our own day to see the Westminster play acted in practicable togas, and the Shakespearean dramas revived with archæological properties and proprieties. We live in an age of criticism, and are never satisfied unless the unities of a work of art are observed religiously, and all its accessories are congruous and "in character." It is useless to lament, as some do, this "over-consciousness"—to borrow a phrase from ethics—this almost exaggerated attention to the minutiae of externals, and to long after the careless freedom of less artificial times. We must take things as we find them, and submit to a certain pedantry as a general characteristic of the age. Art and literature, at least in the old world, have a historic past which moulds the present, and which foreshadows the future. Hence it is that the healthiest and most promising artistic efforts of the day have, in one point of view, an archæological aspect; and neither the inventive painter nor the daring architect can dispense with the humbler labours of the plodding antiquary.

San Micheli as an Architect.

San Micheli was an architect of great abilities, and of a genius more bold and masculine, but less elegant than Palladio's. This is proved by his apparent preference of the Rustic and Doric styles to the Ionian or Corinthian. Of his architecture at Verona the Palazzo Pompei is perhaps the best specimen. The lower storey is Rustic, with an arched entrance and windows; above is a balustrade, over which rise eight single fluted Roman-Doric three-quarter columns, with a continued Doric frieze and a deep cornice. In each intercolumniation is a round arched window, with a head for a key-stone, the middle bust being a Bacchus and the others rather grotesque masks of satyrs, with rams' horns. There is a simplicity about this façade which is very noble and striking. The Palazzo Bevilacqua, also designed by him, is of two storeys, Rustic, with pilasters, and over them a continued projecting balustrade and Corinthian columns fluted perpendicularly and spirally, with a continued entablature and rich frieze. The contrast between the Corinthian and Rustic storeys is too strong, particularly as the former is overloaded with ornament, the ostentatious effect of which is increased by the spiral fluting. Altogether, we should say that it is neither grand nor elegant, but certainly rich and handsome, and its projecting balustrade and continued entablature have a fine effect. The Palazzo Canossa and that of the Gran Guardia, which is Rustic and Doric, are in much better taste, uniting much simplicity with sufficient richness. The Capelli Pellegrini in the church of San Bernardino, also at Verona, is a specimen by Sammiceli of a different description from those we have mentioned. It is a circular edifice of Corinthian architecture, rather deformed by the alternate pairs of columns having spiral flutings, yet upon the whole simple and elegant. The Palazzo Grimani, on the Canal Grande at Venice, is another noble specimen of his skill, and is indeed one of the most magnificent buildings in Italy. It is of three storeys, the lowest supported by fluted Corinthian pilasters and the two others by fluted three-quarter columns, also Corinthian, and is the only instance with which we are acquainted of the repetition of the same order.

Velasquez.

Velasquez was emphatically a man, and the painter of men. He was aware of his strength and weakness; his greatest works—*Las Lanzas*, *Los Bebedores*—have no women in them whatever; and in the *Hilanderas*, a group of females, he has turned aside the principal head in the background, leaving it, like Timanthes, to be supplied by the imagination of the spectator. He was, moreover, a painter only of the visible tangible beings on earth, not the mystical, glorified spirits of

heaven; he required to touch before he could believe—a fulcrum for his mighty lever. He was a man of strong genius, but no enthusiast. Nature was his guide, truth his delight, man his model. In things mortal and touching man, Velasquez was more than mortal; he is perfect throughout, whether painting high or low, rich or poor, young or old, human, animal, or natural objects. His dogs are equal to Snyders; his chargers to Rubens—they know their rider, prancing under knights and ambling under ladies fair. When he descended from heroes, his beggars and urchins rivalled Murillo; while the waggish wassail of his drunkards shows how much less repulsive such subjects, if he had ever repeated them, would have been in his hands than in those of a Dutchman. Nor, if he had devoted himself to landscape, would Spain have wanted her Poussin or Wilson, for, as Wilkie truly says, his scenes are full of the "very air we breathe"—local colour, freshness and daylight, whether verdurous court-like avenues, or wild rocky solitudes. Lastly, his historical pictures are pearls of great price; never were knights and soldiers so painted as in his *Surrender of Breda*. His style was based on Herrera, Carravaggio, Ribera and Stanzioni—an assimilation of all, not a servile imitation of any; while his conceptions were new, fresh, and entirely his own. His drawing was admirable, correct and unconstrained; his execution, technical skill and mastery over his materials complete; his colouring was clear and clean, and laid on at once with a single projection of mind; he seldom used mixed tints; he painted with long brushes, and often as coarsely as floor-cloth; but the effects when seen from the intended distance are magical, everything coming out into its proper place, form and tone. Yet no man was ever more sparing of colour. He husbanded his whites, which, like Rubens, he thought poison except in lights, and even his yellows, which tell up-sparkling like gold on his undertoned backgrounds; these, especially in his landscapes, were cool greys, skies, and misty mornings—nature seen with the intervention of air. He painted with a rapid, flowing and certain brush, as by mere volition, and with that ease, the test of perfection, that seeming absence of art and effort which made all imagine that they could do the same—until they tried and despaired. The results obtained are so true to nature that first beholders, as with Raphael at the Vatican, are sometimes disappointed that there is nothing more. He was above all tricks. There is no masking poverty of hand or mind under meretricious glitter; all is in sober, real, sterling simplicity. No painter was more objective. There is no showing off—no calling attention to the performer's dexterity. His mind was in his subject, into which he passed his whole soul. He clearly conceived his idea, and worked it rapidly out with directness of aim, unity and compression of composition; he knew what he wanted, and—which few do—when he had got it. Then he left off, and never frittered away his breadth or emphasis by torturing details or superfluous finish to mere accessories. These were dashed in *con quatro botti*—but true, for he never put brush to canvas without an intention and meaning. His was the true philosophy of art, the selection of essentials, of all that first and last attracts and addresses itself to the eye, mind and heart of spectators, whom he left to infer the secondary:—*Aquila non captat muscas*.

Principles of Architecture.

The great principles on which architectural beauty and grandeur depend appear to be these, utility, simplicity, variety, richness or ornament, and to these may be added a fifth quality, where it is applicable, magnitude. Many critics would perhaps increase the list by introducing proportion into it, but in all cases the beauty of proportion may in a very great degree be referred to one or other of the qualities before mentioned. The merit, then, of any species of architecture must consist in its possessing the four great characteristics of utility, simplicity, variety and richness, or, at any rate, the three first, which may be considered as absolutely essential. In the union of these certainly lies the difficulty of architecture and the merit of the architect, and from their extraordinary union in the Grecian columnar temple arose the great beauty of that species of building. The two qualities which are peculiarly difficult to unite are simplicity and variety, and they are so because in a considerable degree contrary to each other. Without the first a building may be considered as tawdry, and without the second as poor. These two almost opposite effects were produced by the Greek architects in those edifices which have obtained for them the never-failing admiration of every age of taste and refinement. The leading principle of Grecian architecture is straight, or rather horizontal and perpendicular lines, and from adopting these in all the great parts of the building much uniformity and simplicity are at once attained; to contrast with these and to produce variety curves are as studiously introduced into all the details—the columns are circular in their shafts; their flutings, their bases, the *cima recta*, *reversa*, &c., of the entablature are merely varieties of curves, and the most graceful curves in nature are imitated in the capitals and friezes. Again, variety was obtained in a different manner and in a much greater

degree by the alternation of strong light and deep shade produced by the colonnade of a temple. This last and most important species of variety, it may be remarked, equally exists in the Doric order, which possesses but little of the other ornaments of Grecian architecture, and its characteristic is therefore rather grandeur than beauty, though it sometimes received a magnificent degree of ornament from the insertion of the finest sculpture in its metopes and pediments. The variety produced by the alternate play of light and shade in the colonnades of the ancients would have been too great for unity and simplicity if they had not added long and continued entablatures above and frequently steps below, thus binding, as it were, the columns together and uniting them into one whole. To all these was added the pediment, a part of the building absolutely necessary for its utility and of great beauty when not too high. The Greek architects were quite aware of the necessity of this qualification, but their imitators at Rome were not, if we may judge from the comparatively acute angle of the pediment of the Pantheon, while, on the other hand, there are beautiful instances of low pediments as applied to the Corinthian order in the temple at Assisi and in the Maison Carrée at Nîmes. Why a pediment of a low pitch should please the eye more than one of an acuter angle may be difficult to ascertain; we conceive it to be because it is more consonant to the horizontal lines which prevail in the edifice, and because it suggests the ideas of a finer climate and of more skill in the architect in adapting his roof to it.

Importations of Foreign Art.

In the time of Henry VII. and Henry VIII. we had scholars of Ghirlandaio, Giorgione and Raphael, and after welcomed Holbein, Zuccaro, Rubens, Vandyke, Lely and Kneller, down to Ricci, Zuccarelli, Cipriani, Canaletti, Zoffany, Angelica Kauffman and Fuseli. Scarcely a piece of sculpture do we call our own until the days of Flaxman, Bacon and Chantrey. It is said that the statuary which encrusts many of our cathedrals is the produce of an old English school of sculpture. The fact, if so, evinces either a great lack of national pride or a great carelessness about art, since their countrymen have not deemed their names worth preserving, though we hear enough of Torregiano's bronzes, Holbein's terra-cottas, Hubert le Soeur and Fanelli's statues, under the Stuarts; Roubiliac and Rysbrack in the last century; and the matchless resemblances by the Fleming Nollekens in the present. It had even come to this, that an English surname sounded strange in a sculptor, so Mr. Turner became Signor Turnerelli. In France the same practice of adoption may be observed, tending rather to the development than the hindrance of native talent. Leonardo da Vinci, Cellini, and the whole school of Fontainebleau, stored the cabinets and châteaux of France with materials of study and improvement. Giulio Romano supplied Francis I. with his painters, and his scholar, Primaticcio, with decorators in stucco and fresco. Bernini formed a new school of sculpture in France, and the honours with which he was received bore a striking testimony to the estimation in which art and artists, of whatever country, were held by Louis XIV. In Spain, which had painters of her own, the patronage of Titian and Pellegrini by Philip II. proved both his taste and his freedom from national prejudice. On the other hand, the example of that country may serve to warn us that secondhand art is a lottery, and only good at the right season and for a well-considered purpose. When Philip II. enriched Spain with the great Italian pictures, which he imported at prodigious cost, he was nearly the only person in the country capable of appreciating them; and, by the time that a taste for the highest style of Italian art had taken root there, those Spaniards who went to study it at headquarters unfortunately arrived in Italy when the Bolognese school was triumphant and taste declining. Velasquez, who stands single, like Truth herself, may be said to have escaped this taint. A slight influence from Rubens is by some observed in him, but nothing from Italy. Then came Luca Giordano, whose success and favour at the Spanish court had a most baneful effect (may no Luca *fa presto* visit our shores); his facility in the execution of vast fresco works, with little other merit but facility, set the fashion, and called forth a tribe of insipid followers. His brilliancy and clearness of colouring they never could surpass; whilst they lost, in the pursuit of a foreign excellence, the nature and originality of their own schools. Italy has ever been freer than any country from a jealousy of foreign artists; to be sure she can afford it. One proof may suffice—the employment, namely, at the Papal Mint for nearly a century of that celebrated series of artists, all of the Bavarian family of Hainneran Hermanskerker. Under fifteen pontificates their papal medals were unrivalled for workmanship. They formed, of course, a school; and the Italians wisely profited by it. Louis XIV. in vain made them the most splendid offers. How eminently the Germans are indebted to the agency of foreign influences may be shown by tracing out their actual taste and proficiency in art. Their æsthetic of the most subtle graces of Raphael is certainly no inspiration of Albert Dürer, nor transmitted to them through his countless pupils. Their profound refinements on the theory and principles of art, which baffle

our practical understandings, are not based on native productions, but rather are metaphysically begotten through an intense appreciation of the Greek *chef-d'œuvres* at Munich and the pictorial treasures at Dresden.

The Specific in Landscape Painting.

The true ideal of landscape is precisely the same as that of the human form, it is the expression of the specific—not the individual but the specific—characters of every object in their perfection; there is an ideal form of every herb, flower and tree: it is that form to which every individual of the species has a tendency to arrive, freed from the influence of accident or disease. Every landscape painter should know the specific characters of every object he has to represent—rock, flower or cloud, and in his highest ideal works all their distinctions will be perfectly expressed, broadly or delicately, slightly or completely, according to the nature of the subject and the degree of attention which is to be drawn to the particular object by the part it plays in the composition. Where the sublime is aimed at, such distinctions will be indicated with severe simplicity, as the muscular markings in a colossal statue. Where beauty is the object, they must be expressed with the utmost refinement of which the hand is capable. This may sound like a contradiction of a principle advanced by the highest authorities, but it is only a contradiction of a particular and most mistaken application of them. Much evil has been done to art by the remarks of historical painters on landscape. Accustomed themselves to treat their backgrounds slightly and boldly, and feeling (though only in consequence of their own deficient powers) that any approach to completeness of detail therein injures their picture by interfering with its principal subject, they naturally lose sight of the peculiar and intrinsic beauties of things which to them are injurious unless subordinate. Hence the frequent advice given by Reynolds and others to neglect specific form in landscape, and treat its materials in large masses, aiming only at general truths—the flexibility of foliage but not its kind, the rigidity of rock but not its mineral character. In the passage most especially bearing on the subject (in the eleventh lecture of Sir J. Reynolds), we are told that “The landscape painter works not for the virtuoso or the naturalist, but for the common observer of life and nature.” Yet the sculptor is not for this reason permitted to be wanting either in knowledge or expression of anatomical detail, and the more refined that expression can be rendered the more perfect is his work. That which to the anatomist is the end is to the sculptor the means. The former desires details for their own sake, the latter that by means of them he may kindle his work with life and stamp it with beauty. And so in landscape, botanical or geological details are not to be given as matters of curiosity or subject of search, but as the ultimate elements of every species of expression and order of loveliness.

Palladian Innovations.

When Palladian architecture became universal through Italy its promoters seem to have considered as authority every building that was ancient, and it in consequence frequently happened that most barbarous edifices rose “like exhalations.” In these buildings, and particularly in the fronts of the churches, were seen columns placed on high pedestals supporting entablatures that projected over each column; over these, columns of a different order; above, another broken entablature, ending frequently in a high pediment, cut in the middle like a mitre as if to catch the rain instead of driving it off, these columns being only three-quarters, and very possibly the entablatures and pediments over the doors and windows also broken. Thus were produced buildings totally deficient in every principle of Grecian architecture, having neither the repose of flat surfaces, nor the simplicity of connected lines, nor the variety produced by the alternate play of light and shade, and perhaps full of ornament in every part except where the ancients bestowed the greatest richness, the frieze and the pediment, which were left entirely plain. Of all these defects the breaking the summit of the pediment is certainly the worst, and is believed to be entirely without ancient precedent in the Classic lands of Greece and Italy. It is frequently accompanied by another barbarism equally unauthorised—that is, when the upper colonnade is narrower than the lower on account of the side aisles, of placing on each side of the upper storey a sort of ugly volute or ear. The churches built by the father of modern architecture are not free from several of these defects. The palaces built in his age are perhaps generally better than the churches. Those by himself at Vicenza are not in general the best of the time, but we should recollect that the taste and science of an architect are frequently obliged to bend to the ignorant caprice of his patrons. This has been the case with respect to the Palazzo Chiericati at Vicenza, a very magnificent design in its greater parts and of very pure taste, but very much injured by ugly stucco ornaments over the windows and miserable statues and pinnacles on the roof. The latter must have been additions to the original design, as they do not appear in the engraving in Palladio's works.

NOTES AND COMMENTS.

THE instruction in building construction, metal-working, plumbing and other technical subjects given in the Walker Engineering Laboratories, University College, Liverpool, appears to be as successful as the late founder, Sir A. B. WALKER, could have anticipated. According to Professor HELE-SHAW'S report, which was read on Tuesday, the engineering students now number seventy-five. The improvement in the nature of the work kept pace with the increasing numbers. There were 18 entries in the metal-working class, and 22 in the wood-working class. The exhibition of 80 pieces of plumbing-work was an indication of the kind of work which was being done by the apprentices under the instruction of a body of working-men, who had from the beginning organised and conducted these classes under the name of the Liverpool School of Plumbing. There had been 28 entries and 777 attendances during the session. The Professor said that the time had now come when the work of technical education, being entrusted to the city council, would enable the complete organisation throughout the whole of Liverpool to be so carried out by means of centres judiciously placed in various localities that the college would be able to undertake its natural function as a general centre for the advanced classes up to which the various subsidiary centres would naturally lead, and the qualifications for which would be a certificate of attendance and proficiency attained from one of the out-lying centres. The working-men themselves, by their exhibition scholarship scheme and their resolution to appoint the scholars from the successful candidates, had shown the way in which this might be accomplished. Ten scholarships of 3*l.* each would be awarded on the results of the work of those classes. If a higher class of work were to be undertaken in the Walker Laboratories to which the out-lying centres would lead, the work must necessarily be more limited in its character; and if the working-men were to obtain access to the testing-machine and the more refined apparatus of the Walker Laboratories, they could not be accommodated in such large numbers as had applied, and would have to pass into that work as the result of a process of graduation, since higher teaching could not be done on the wholesale principle. The scheme adopted for the third session of the penny technical lectures differed slightly from that of the preceding years, inasmuch as, in addition to the regular classes in the two subjects, machine drawing and building construction and drawing, which represented the most important industries of Liverpool—the engineering and the building trades—there had been six special short courses of three lectures each. The students at the penny technical lectures and the short course of lectures numbered 428, and the total attendances were 1,688.

A JUDGMENT given by Lord Justice LOPES, on Monday, will not be considered as satisfactory to mortgagees. The Tottenham Local Board claimed 113*l.*, proportion of expense of paving, sewerage, &c., a new road, from the defendant, who was only second mortgagee, but who was for a time the receiver of the rent. The board relied on the definition in the Public Health Act, "That the owner is the person for the time being receiving the rack-rent of the lands or premises, whether on his own account or as agent or trustee for any other person." The defendant did not receive any rents after June, 1892 (the claim was made in March, 1892), and what he received previously was of no benefit to him, for the whole sum had to be handed over to the first mortgagee. Lord Justice LOPES considered that the question to be decided was whether the defendant was "owner" of the houses at the time when the expenses were "estimated" which were afterwards apportioned by the surveyor. The Act pointed, in his opinion, to the time when the expenses were estimated, not when the work was completed. The defendant had at the time been in receipt of the rent, and so up to the time of action, and his lordship was of opinion that the intention of the Legislature was that any person who has received the rents from the occupier should be deemed the "owner." Cases might

arise when it would be difficult to find the real owner, and therefore it was deemed desirable to make the actual receiver of the rents liable. Accordingly judgment was given in favour of the Local Board.
